Ellmers, Renee

Renee Ellmers is a member of the U. S. House of Representatives from the 2nd District of North Carolina. She was first elected in November 2010. She won re-election to a second term in the November balloting in 2012 and began serving her second term in the 113th Congress in January 2013. She has used social media effectively in her campaigns and in her service in the House of Representatives.

Congresswoman Ellmers was born Renee Jacisin on February 9, 1964, in Ironwood, Michigan. Her mother, Caroline Pauline (née Marshalek) Jacisin was of Croatian and Polish descent. Her father, LeRoy Francis Jacisin, was of Czech and French-Canadian descent. The family moved to Madison Heights, Michigan, when she was a child in order for her father to better provide for the family as an automobile worker.

After graduating from Madison High School, she worked a variety of jobs in order to pay her way through Oakland University in Oakland County, Michigan. She first received training as a medical assistant and then graduated in 1990 with a bachelor of science in nursing. She then worked as a nurse in the intensive care unit of Beaumont Hospital in metropolitan Detroit.

While working at Beaumont Hospital, Renee Jacisin met her husband Brent Ellmers, a surgeon. After the birth of their son, they moved to Dunn, North Carolina, in Harnett County where they practiced medicine and nursing, respectively. She also helped to manage the family's small medical practice.

In Dunn, she became the clinical director of the Trinity Wound Care Center. She served as vice president of community development for the Dunn Chamber of Commerce and as president of the chamber. She served on the Dunn Planning Board of the Betsy Johnson Hospital Foundation and the Harnett County Nursing Home Committee and taught Sunday school in the Sacred Heart Catholic Church in Dunn.

Political Career

Ellmers had not been engaged in politics nor had she had any political ambitions until the political struggle that arose with the introduction of the Patient Protection and Affordable Care Act (PPACA), which was adopted on March 26, 2010. It is known popularly as Obamacare. Her husband and she attended a town hall meeting on President Barack Obama's proposed health care plan. What they heard was very distressing to them. It would, she believed, allow the government to dictate patient's rights to health care, and it would also punish small businesses.

As a nurse and the wife of a physician who was intimately involved in health care delivery, she found her opposition to the bill required action. To oppose Obamacare, Ellmers became active in local Republican Party politics in the summer of 2009. She also joined Americans for Prosperity (AFP). A conservative public policy interest group, AFP helped many Republicans in the 2010 election. Its advocacy is for free-market solutions rather than government-imposed solutions to most problems. Thereafter, she entered the Republican Party primary for the nomination as its candidate for the 2010 election for the office of representative in Congress.

In the Republican Party primary held on March 4, 2010, Ellmers defeated Todd Gailas, an automobile salesman, and Frank Destrinch, a retired businessman. Gailas used Facebook during the primary campaign to seek votes. On his Facebook page, he described himself as a small business

owner and concerned citizen rather than a career politician. This, he claimed, would enable him to understand the people because he was not governed by power brokers in Washington, D.C.

Frank Destrinch was a newcomer to the district. After retiring from the Marine Corps, he had served in Nebraska as a district supervisor for Nebraska's Game and Parks Commission. He used LinkedIn and allied with other bloggers to gain an Internet presence. However, it was to no avail because Ellmers's campaign was able to raise and spend more money than her opponents, which helped her to win the nomination.

Bob Etheridge

Ellmers then proceeded to the general election campaign against Bobby Ray "Bob" Etheridge. In 1996, Etheridge had defeated Republican incumbent David Funderburk for the North Carolina 2nd District Congressional seat. He then won re-election in the subsequent elections in 1998, 2000, 2002, 2004, 2006, and 2008 by well over 50 percent of the vote as he defeated Republican challengers. In 2010, the prospects for re-election looked good against Republican challenger Renee Ellmers and Libertarian nominee Tom Rose. However, on June 14, 2010, Etheridge was involved in an infamous incident.

Two young men, who were traditional college age, hailed and approached Congressman Etheridge on a sidewalk in Washington, D.C. They identified themselves as student reporters working on a project. As they videotaped Etheridge, they asked him if he "fully supported the Obama agenda." Instead of answering the question or perhaps dismissing it, he repeatedly asked them, "Who are you?" Etheridge then grabbed one of the young men by the wrists, neck, and shirt (as shown in the video) while repeatedly saying, "Who are you" as the young man repeatedly asked to be let loose. The incident went viral on many blogs as the YouTube video quickly hit the Internet.

Later Etheridge apologized for the "Who are you" incident in a statement at a press conference. By the end of the next day, June 15, many on the Internet were calling for Etheridge's arrest for assault, although by engaging in physical contact, the appropriate charge would have been battery. Soon, Democrats were defending him for his actions, claiming that the youths were Grand Old

Party (GOP) operatives. The spin politicizing of the incident, much of it on blogs or other Internet sites, gave Etheridge political cover.

On June 18, 2010, a Mississippian, Brandon Leslie, gave a statement to the *Southern Pines Pilot* that he had been assaulted in a similar manner as the two young reporters in 1996 by Etheridge. At the time, Leslie was a student at Pinecrest High School in Monroe County, North Carolina, which then was part of the 2nd Congressional District. Etheridge, a first-time candidate for Congress, was the state superintendent of public instruction. When Etheridge came to one of the school's football games, Leslie approached him to ask about a particular education program. After Etheridge did not answer the question, Leslie repeated the question two more times. Then Etheridge, according to Leslie, grabbed him by the shoulders and shook him, saying that he should learn to respect his elders. Leslie found the incident shocking.

Now 32 years of age and an attorney in Oxford, Mississippi, Leslie described himself as a Democrat who supported the Obama agenda. However, he said that watching the "Who are you" video evoked bad memories. Leslie's claim was dismissed by his retired high school principal on the grounds that Leslie had been in the wrong. Many on the Internet found this insufficient and accepted the story as proof of a pattern of repeat offences by Etheridge, whose staff later claimed the report was in error.

The "assault" by Etheridge was defended by MSNBC host Chris Matthews as justified because it was bad manners to ask a question of a lawmaker. Furthermore, opined Matthews, it was an ambush by a group of unknown activists. These remarks generated a flood of blogging as supporters of the students denounced Matthews.

Etheridge's behavior aided Ellmers's campaign because it alarmed many people who viewed his actions as arrogant behavior. However, over the Internet, numerous negative comments were made on blogs, Web sites, and other forms of social media. The comments that defended the congressman were usually vitriolic and extreme. Those that denounced his behavior pointed to its character as warranting more than the statement he had released, including arrest and forced resignation. Ellmers used the video to boost her

campaign, pointing out that, if it had been a teacher at a school where her children attended, the teacher would be in serious trouble.

Tom Rose, the Libertarian Party candidate for the congressional seat held by Etheridge, was also quoted on the Internet in *Current*. He called for the Washington, D.C., police to arrest Congressman Etheridge. The fact that they had not, he declared, was strange. Furthermore, when asked if Etheridge appeared drunk during the assault, he replied "drunk with power." Rose used social media to conduct his campaign. One program on which he appeared was a blognet radio program *A Stranded Citizen*.

2010 Election

In the 2010 election, Ellmers defeated Democrat Party incumbent Bob Etheridge. He had been expected to win by pundits as a seven-term incumbent of the House of Representatives despite Ellmers's support from the Tea Party and Sarah Palin. Libertarian candidate Rose received only 1.8 percent of the vote, a total of 3,505 votes. Etheridge received 48.7 percent (92,393 votes), while Ellmers won with 49.5 percent (93,876 votes). The election was close and ended with a victory of 1,489 votes after a recount.

In her first term in office, Ellmers was appointed to the House Committees on Agriculture, Foreign Affairs, and Small Business as well as the Subcommittee on Healthcare and Technology, of which she is the chair.

Ellmers was elected in 2010 with Tea Party support; however, she has been a strong supporter of Speaker of the House John Boehner. This has not pleased Tea Party members, who see her as inconsistent. Her committee assignments in the 112th Congress have enabled her to speak forcefully for her freshman class. Her guiding principles have been cutting wasteful spending, rolling back harmful government regulations, and giving small businesses and entrepreneurs the ability to succeed and prosper.

In June 2012, Ellmers, as chair of the House Small Business Committee's Subcommittee on Healthcare and Technology, requested that Kathleen Sebelius, secretary of the U.S. Department of Health and Human Services, send a status report on the agency's health information technology patient safety efforts. The request was to address

recommendations in the Institute of Medicine (IOM) report of November 2011.

2012 Election

In the 2012 election, Ellmers defeated two opponents. Steve Wilkings, a retired U.S. Army officer, was her Democrat Party opponent. Her Libertarian Party opponent was Brian Irving, a retired U.S. Air Force officer. In this election, Ellmers won with 55.9 percent to 41.4 percent for her Democrat opponent and 2.7 percent for her Libertarian opponent.

Irving used some social media, including YouTube, to wage his campaign. He was interviewed on some blogs but with very limited success. Wilkins created his own Web page with links to Facebook, LinkedIn, Flickr, YouTube, Twitter, and e-mail. He also established a campaign blog that was, in the end, not enough. Ellmers, like her opponents, created a campaign Web page and a blog and included Twitter, YouTube, Facebook, and media-streaming links.

In the 113th Congress, Ellmers served on the House Energy and Commerce Committee Subcommittees on Health, Communications and Technology, and Oversight and Investigations. Her Congressional office Web site has a number of links to other sites such as GOP.gov and C-Span.org. Some of these are causes that she supports, such as a balanced budget amendment to the U.S. Constitution. Another is SmallBizOPENmic, which is linked to the House Committee on Small Business.

Social Media

Ellmers regularly uses Twitter and encourages followers to sign up to follow her. Her subcommittee Web site has access to Facebook, Twitter, YouTube, and other links to social media. One links to video feeds. She can also be reached via e-mail.

Ellmers's Facebook page has numerous posts from thousands of people as well as numerous links to other issues or supporters of her issues of promoting small business, ending the crushing public debt, ending high taxes, and reducing excessive regulations. She can be found on a number of blogs promoting her concerns and legislative issues. An important media link for her constituents is to constituent services. Here, her constituents can ask for help with a government agency, in

getting a flag that was flown over the Capitol, or any number of things, including helping children learn about the American system of government.

Embedding

The concept of embeddedness, introduced by economic sociologist Mark Granovetter in the 1980s, is used to define to what extent individuals or groups are entangled in a particular social environment or network in its broad sense. Granovetter developed a sociological perspective on economic actions focusing on the patterns of social relations as a way to reduce market uncertainty through embedding economic transactions into social structures. Later, other scholars suggested differentiating between embeddedness and embedding: The first concept refers to the end state of embedding,

while the second is the process as such. In other words, embeddedness is more structure oriented, whereas embedding is dynamic, referring to the process that is continually changing.

Scholars whose research interests and projects lie within the application of social network analysis (SNA) suggest that embeddedness is a hierarchical nesting of cohesive structures. Moreover, they distinguish between the overall embeddedness of the networks in larger communities or societies that result in the prevalence of particular ego networks in a population and the network embeddedness of individual actors into groups and organizations.

Social Media

With the rapid development and expansion of social media in all forms of electronic communication (i.e., social networking sites), users receive opportunities to create online communities for sharing ideas, exchanging messages, and sending content such as music or videos. Social media allow for using Web-based technologies for communication in the form of interactive dialogue through the variety of social media tools: social networking sites, blogs, content communities, forums, podcasts, video and photo sharing sites, and virtual games.

Embedding of individuals in larger groups and communities via social media leads to higher inclusion of actors into various activities announced or communicated through social media, either on purpose or spontaneously. Use of social media platforms like Facebook, Twitter, or YouTube affects various spheres of human life, from marketing and political actions to privacy and identity construction. There is a growing range of studies on how these platforms impact on contemporary life of people in different countries, where one possible angle is to compare the use of social media worldwide and across particular countries for specific purposes. For instance, the embedding of the Spanish citizens into the protest actions during the last year happened mostly due to the use of social media by public activists for citizens' mobilization. Thus, social media can empower actors who would remain powerless without these modern tools. Marginalized social groups are able to promote their agendas on free and easy-to-use platforms. Moreover, embedding in social media

communities and groups matters for recruitment of new participants as well as for supporting continued participation among existing group members, discouraging them to leave the community.

When talking about the process of embedding with regard to social media, one should consider to what extent new forms of media become embedded in people's everyday lives. Hence, social media are saturated in contemporary life; they have become a tool and a place for conflicts among a multitude of organized and autonomous actors. New forms of media and news sources cause changes in politics of organization and changes in their self-representation online.

The positive aspect here is that social media platforms eliminate the pure use of traditional advertising when communication is directed mostly from producers to consumers; instead, social media platforms enable receiving easier and faster feedback about the product or service that the provider can get from its customers. It results in embedding of more clients into the network of a particular organization. Therefore, it becomes more crucial for the company to take care of its own reputation and image using social media platforms among other communication channels.

Social media serve as a free and open space for the interaction of wide ranges of stakeholders who aim to share comments about organizations or get opinions alternative to the official statement from an organization. Therefore, embedding of social media into the communication of stakeholders leads to lower domination of an organization in creating its image.

Embedding through social media occurs in various dimensions, specifically in relational, cognitive and emotional, cultural and political, and spatial and geographical spheres of one's life. It is highly connected with how people perceive social media trustworthiness and to what extent they are media literate. A number of studies of Internet penetration across countries, as well as across social categories by age or income, have demonstrated that different categories vary in their online visibility, which might lead to asymmetrical power relations. However, embedding of social media also leads to a blurring of public and private spheres.

Engagement Advertising

Engagement advertising is a form of marketing that encourages customers to coconstruct the brand of a political entity such as a politician, group, issue, or campaign. Through engaging with the brand's digital presence, like a social network profile, the consumer creates the political entity's image by responding to existing information or adding content. Rather than conceptualizing the consumer as passive, engagement advertisers propose a long-term, active, and meaningful relationship between the brand and its public. In return for the consumer's engagement, the brand helps to construct the identity of the consumer by digitally linking with the individual and representing an interest or facet of that individual's life. Through this engagement, advertisers hope the consumer becomes invested in the success of the political entity, which will result in long-term support. While engagement advertising comes in many forms, the affordances granted by social networking sites have greatly changed the way engagement is conceptualized, measured, and implemented by political groups.

Engagement advertising encourages the participation of the public in the construction of a branded image through digital interaction. Tomi T. Ahonen and Alan Moore propose that this form

of advertising rests on the basic assumptions that human beings are social animals and need to communicate and interact. These interactions can take place in the physical world and, more newly, through social media. The purpose of engaging messages is to encourage long-term relationships rather than one-time demonstrations of support, such as monetary donations. Political engaging messages ask supporters to go do something, such as watch a video and repost or share with friends. It is through an engaging action with the brand that a long-term commitment is developed between the public and the political entity.

Ultimately, this form of advertising asks the public to act in response to a communicated message. Responses include volunteering for a political cause, sharing information with friends through various channels, or posting comments on public message boards, digital profiles, and social network spaces. These responses both fulfill the needs behind the original message and encourage the public to take partial ownership and control over the brand by being responsible for the content associated with the entity. For example, a message asking supporters to like a candidate on Facebook not only increases the digital presence and status of the candidate but also offers supporters a means of controlling the candidate's digital image. Further, the public benefits from this action because the social media site connects the two profiles and associates them with each other. This multipronged relationship built between the political entity and its public elicits increased feelings of support and loyalty between both sides.

Engagement advertising encourages a prolonged relationship between a political entity and its public that increases communication long after the initial engagement campaign is complete. Cynthia M. Gibson advocates that, through digital engagement, the public can provide feedback on a politician's stances, policy creation, and issue salience. This can further encourage transparency between politicians and their publics as well as offer control over the actions of elected officials. Gibson also proposes that engagement advertising encourages both top-down and bottom-up communication due to the initial communication by a political organization and the following encouragement of a response by the public.

Studying Effectiveness

Web 2.0 technologies and social media make engagement responses diverse. Through the use of blogs, live chat, and product ratings, the public is invited to not only engage with the organization presenting the message but also to engage with other consumers or members of the public. These Web 2.0 spaces can be managed by the political organization behind the original engaging message or are alternatively created and controlled by the public. Consider President Barack Obama's presence on Facebook. In addition to an official politician page run by the official Obama for America campaign, there is also a community and fan page run by individual supporters. The many Web 2.0 spaces provide endless possibilities for the public to engage after observing or consuming an engagement campaign. Thus, measuring all forms of engagement responses in all social media is nearly impossible. To measure campaign success, engagement advertisers must make desired outcomes of messages clear, specifying where and when they want the public to respond.

The multitude of methods used to measure effectiveness suggests that engagement advertising can be studied through both qualitative and quantitative approaches. Researchers J. R. Martin and P. R. R. White studied advertising and identified two forms of engagement messages. Because of the differences between these two types, different methods and models are required to study engagement. First, heteroglossic messages are present when the engaging campaign does not explicitly state a desired outcome and the public is open to perform a variety of responses based upon their individual abilities, interests, and preestablished knowledge. Second, monoglossic messages occur when the engaging campaign demands one single, correct response, such as liking a candidate, watching a video, or sharing content with friends.

Monoglossic messages can be quantifiably studied for effectiveness because of their single-step cause-and-effect relationship. However, monoglossic messages are problematic because of their limited demands of the public and failure to recognize alternative responses outside of the predetermined set of actions. Heteroglossic messages can rely on models to determine effectiveness but may alternatively use qualitative methods such as

focus groups or interviews to examine the reasoning behind a specific form of response.

Engagement advertising can be alternatively studied through neuroscience and psychology. Work on emotions in brand loyalty and consumer engagement suggests it is emotional appeals and not messages routed in logic that are most effective at engaging the public. Drew Westen found that emotional television ads and campaign electronic messages were more likely to encourage volunteerism, fund-raising, and voting. Westen further suggests engagement advertising should feature the emotional appeals found in other media such as songs, newspaper articles, and movies to encourage the public to digitally interact with a political entity. For example, integrating the lyrics of the popular song "Sweet Home Alabama" by Lynyrd Skynyrd into today's political campaigns will draw on the brain's preestablished emotional network that associates that song with previous mediated experiences. By drawing on these emotional networks, a campaign can encourage engagement with digital media by reinforcing its message with familiarity and a sense of community. To prolong these pleasant emotional connections, the public can go online to engage with similar-minded supporters of the political message, thus finding unity not just in the politics but also in the emotions of the engagement advertisement.

Engagement Features

First defined by Sydney Verba, Kay Lehman Schlozman, and Henry E. Brady, engagement is an activity that is purposely done to influence government action through public policy or through the election of those who create public policy. As the theorists note, engagement is a key underlying feature of an active public sphere. Rather than a singular activity, engagement takes many forms including voting, volunteering, campaigning, digitally interacting with a brand's social media presence, and voicing opinions. It is critically important to study engagement because it is frequently the desired outcome of social media political campaigns.

The features or indicators of engagement are broad and include civic, political, public voice, and cognitive indicators. Participation is best viewed as a continuum; defining others as engaged or unengaged is problematic in considering the full scope of the features of engagement. When studying the practices of a social group, all four sets of indicators must be taken into account to understand full democratic engagement. These four sets of features are explained by Cliff Zukin and colleagues, who propose that, by interviewing participants and asking questions from each set, a comprehensive, quantitative assessment of the current state of public engagement can be achieved. Each set of indicators addresses various activities performed by individuals. The frequency of these activities suggests the intensity and longevity of each type of engagement. Because of this, it is possible for an individual to be mostly civically engaged and not politically, public voice, or cognitively engaged.

Zukin and colleagues define civic engagement as volunteerism directed at community problem-solving and assisting others. Civic engagement features include problem-solving, regularly volunteering for nonelectoral organizations, active membership in groups or associations, and

participation in fund-raising ventures for charity. As a complement to these activities, those who are heavily civically engaged suggest that doing the ethically and morally correct thing is more important than following the exact letter of the law, thus accounting for the activism tendencies within this group.

Political engagement features emphasize regular voting; persuading others to vote; displaying buttons, signs, and stickers; financially contributing to a campaign; and volunteering for candidates or political organizations. Traditional political engagement demands a public that obeys the law and sees public engagement as obligatory.

Features of public voice engagement include contacting officials and media, protesting, petitioning, boycotting, buycotting, and canvassing. Zukin et al. contend boycotting and buycotting (the opposite of boycotting) are two of the fastest growing and most popular forms of engagement in the 21st century. These activities ask consumers to consider the ethical and moral implications of purchases and the corporations that produce the goods.

Lastly, cognitive engagement features consist of attending to coverage of government and public affairs, talking with family and friends about politics, political knowledge, and attention to news media. This feature is viewed as critically important to the potential of a group to orient and organize around a specific issue, politician, policy, or group. Therefore, the features of cognitive engagement support the efforts of political, civic, and public voice ventures.

Social Groups

Each of the four forms of engagement features is important to a well-rounded public sphere. While none are inherently more important than the others, civic and political engagement are viewed as the most widely practiced and most divisive. A key difference between civic and political engagement involves the social groups that primarily practice each. While older generations such as the G.I. Generation, Baby Boomers, and Generation X practice traditional political engagement, the Millennial Generation or DotNet Generation, born between 1980 and 2001, practice newly popular forms of civic engagement. Zukin and colleagues propose the divide between the

practitioners of political and civic engagement creates a tension between the generations that leads to intergenerational misunderstandings and miscalculations of the potential of the newer generation. For example, because civic engagement does not prioritize voting, those practicing political engagement see the newest generational cohorts as contributing to the perceived downward spiral of American politics.

Beyond generational groups, other social groups emphasize each of the four forms of engagement. For example, education is heavily related to civic engagement. Those with higher levels of education are more civically engaged. Interestingly, television watching and overall engagement is viewed as a zero-sum relationship. Zukin and colleagues suggest that the more an individual does of one, the less the individual will do the other. All forms of engagement strongly relate to being asked to participate. Across all social groups and generational cohorts, those who are asked to civically, politically, public voice, or cognitively participate are more likely to do so.

Benefits

Engagement is an important indicator of overall democratic health and individual life satisfaction. Gail Pacheco and Thomas Lange found individuals who heavily practice civic, political, public voice, and cognitive engagement are more likely to have high levels of life satisfaction. As amounts of engagement went up, so did life satisfaction. Importantly, life satisfaction was related to those who actually were engaged, not just those who lived in countries where engagement was possible. This is supported by John C. Beasley's work that proposes life satisfaction is highest when there is a perception that democratic engagement is effective and accomplishes a goal.

Critiques

The traditional understandings of engagement become complicated by social media, in that a frequent critique of social media is that it represents passive engagement, rather than active engagement. It is the notion of intentionality and activity that are intrinsically related to engagement that provide a challenge for researchers. Is use of political social media an active or passive form of political and civic engagement?

In general, this is a debate focused on the Millennial Generation. Because millennials are the most frequent and primary users of social media such as Facebook and Twitter, many researchers such as Jean M. Twenge question if this is a true form of political or civic engagement. Twenge's argument asserts that social media use is passive and primarily focused on the individual rather than the community or society aspects. Because of this, she deems millennial use of social media as an inferior form of political engagement.

However, not all researchers agree with this conclusion. Zukin et al. and Russel J. Dalton suggest that although political and civic engagement are now primarily mediated through social media, this does not take away from the political agency of the Millennial Generation. While engagement may take on a new form, it is still valuable and capable of change and government influence.

Environmental Issues

Recent decades have seen two distinct but related changes in environmental politics, both of which are attributable to the expansion of social media. First, information about the state of the environment has become more readily available for those with access to the Internet or other networked technology. Second, those who are concerned about environmental problems have begun to make use of various social media channels in their organizing and mobilizing efforts.

The proliferation of social media channels has promoted a shift in the way that many think of news and journalism. The lines between professional journalism and user-created content are increasingly blurred as audiences gain access to new communication technologies and journalists take to Twitter and the blogosphere. As news content and social media converge, material about environmental issues like global climate change, pollution, habitat destruction, and animal welfare is increasingly shared fluidly between the once-distinct domains. For example, links to stories from more traditional news sources (such as newspapers, newsmagazines, radio shows, and broadcast and cable news programs) about environmental issues and events may be posted on Facebook, tweeted, or become the subject of a blog entry. In this way, news content becomes a part of social media, often with the addition of user reactions or commentary (however slim, this opportunity for participation is a hallmark of Web 2.0 technology). Stories that may otherwise have gone relatively unnoticed can be amplified (or “go viral”) when concerned media users pass them along to their social network, and such extra attention may even lead to citizens demanding accountability from business leaders or government officials for actions they deem to be eco-destructive.

On the other hand, mainstream news media sometimes fail to cover an environmentally significant event, such as an environmental protest or the passage of potentially damaging legislation. In these cases, social media users have many different channels through which to disseminate the news, such as Twitter, Facebook, YouTube, and Tumblr (and other blogging platforms). Successful social media campaigns may even keep an issue in the public’s awareness long enough

to generate widespread concern and move the subject into mainstream media, as was the case with the Monsanto Protection Act early in 2013. When President Barack Obama signed a spending package that prevented government shutdown, he also sparked outrage among food and environmental activists. The source of their anger was a rider that allowed genetically engineered crops to be distributed and cultivated despite any potential court injunctions. Nicknamed after biotechnology giant Monsanto (facing such a court case at the time), the provision was quickly denounced on Facebook and Twitter. Within weeks, the issue reached the mainstream media, including coverage on *The Daily Show*.

Further blurring the line between traditional news journalism and user-generated content, several popular news sites have blogs devoted exclusively to the environment. For example, the *New York Times* Web site hosts the Dot Earth blog (dotearth.blogs.nytimes.com) and the popular news blog *Huffington Post* has a subsection called HuffPost Green (huffingtonpost.com/green), both of which provide digital space for environmental issues to be presented and discussed. The blog format allows writers to avoid some of the limitations of traditional print news by offering readers more in-depth background information (particularly important when it comes to complex topics like climate change) and by giving them an opportunity to respond to entries in comments sections. Other environmental issue blogs represent various points of view that were largely unknown before social media, like the conservative environmentalist voices at Rightwaytobegreen.com and the Daily Green’s Green Conservative blog.

Journalists and private citizens are not the only parties who use social media to disseminate information about the environment. On Mondays, environmentalists in the Twitterverse use the hashtag #EcoMonday to suggest green tweeters and topics for other users to follow. With increasing frequency, politicians and corporate leaders are using channels like Twitter and Facebook to share their perspectives on—and in some cases explain their involvement with—environmental issues. For example, immediately after the explosion on the Deepwater Horizon oil drilling rig in the Gulf of Mexico, BP (@BPGlobalPR) used Twitter to keep people

updated about events as they unfolded, carefully sidestepping the issue of responsibility.

Political Campaigns and Causes

The second change in environmental politics has to do with the organization of campaigns and mobilization of support for environmental causes. Social media have proven useful in addressing environmental concerns, as a tool for both grassroots and national activist organizations. For decades, environmental activists spread information about their causes by reaching out to supporters through the mail or by localized, face-to-face networking. They relied on traditional news coverage to bring attention to their campaigns and events, and were restricted by its structure and limitations (e.g., events must coincide neatly with the news cycle, be timely, and be sufficiently dramatic). However, social media technology has also allowed organizations to mobilize support for their causes through digital

networking. Activists can now post information about meetings and events on their Facebook pages and make educational videos available on their YouTube channels. From small groups in the Midwest fighting the mining of sand for large-scale hydraulic fracturing to larger networks pushing a measure to label genetically engineered food in California, environmental organizations have overwhelmingly embraced new digital tools in their campaigns.

Petition Web sites like Change.org and MoveOn.org also offer new possibilities for environmental activism by lowering the barriers to creating a successful petition. Rather than going door-to-door or circulating paper petitions at meetings and rallies, concerned parties can use these platforms to create an electronic petition designed to target government or corporate interests. Invitations to sign are then distributed through e-mail, along with a hyperlink that directs the recipient to the petition. Change.org

The Sea Shepherd Society is an example of an environmental group that has used social media extensively to spread its message. These society members were engaged in a skirmish with a Japanese whaling ship north of the Ross Sea off Antarctica on February 2, 2009, as part of their 2008 and 2009 campaign against Antarctic whaling. The activists, backed by their own helicopter, countered water cannons by flinging bottles of rancid butter toward the whalers in an effort to deter the ship from the hunt for whales.

and MoveOn.org petitions have addressed many different political issues, but environmental topics have included the labeling of genetically modified organisms (GMOs), removing toxic materials from consumer products, establishing limits on the release of greenhouse gasses, and ending the controversial practice of natural gas extraction by hydraulic fracturing.

Digital communities have grown around Web sites and blogs that focus on environmental issues, often with a common goal of fund-raising. For example, green economist Bill McKibben founded 350.org (so named for the estimated safe level of greenhouse gasses in the atmosphere, in parts per million). The site allows visitors to learn more about the group's current campaigns and sign up to receive more news via e-mail. Supporters can also contribute to 350.org's goal of decreasing fossil fuel use by making a financial donation with a credit card or PayPal. McKibben also makes use of Twitter to inform and mobilize his followers (numbering nearly 90,000 in 2013). Another green site, Water.org, gathers microloans to fund water sanitation projects in less developed nations.

While 350.org and Water.org were both established as online communities, many older environmental organizations (e.g., Greenpeace, the Sierra Club, and World Wildlife Fund) have also made the transition to social media. Commonly, their sites look much like the 350.org site, offering information about current campaigns, links to connect via other social media channels like Twitter and Facebook, and a secure portal for monetary contributions. These organizations are large and well established, meaning that they have the necessary resources to present a polished and user-friendly Web site to members and potential donors. Some have even released applications for smartphones or tablets, like the Sierra Club's iPhone app that asks users to pledge to change their behavior in ecofriendly ways.

Other groups have made social media a cornerstone of their activism. One notable example is the anti-whaling group Sea Shepherd Society, which makes months-long voyages to the Antarctic in order to curtail whaling activity by Japanese fleets. Because the trips are lengthy and dangerous, journalists rarely accompany the Shepherds and coverage by traditional news outlets is limited. But Paul Watson, the group's leader, has

been remarkably successful in getting information about the Sea Shepherd Society to the public. Along with a Web site, he has used Twitter and YouTube to publicize its campaigns and achievements. News outlets often use material that has been either produced or approved by Watson, giving him unique control over the type and tone of coverage.

Challenges

While social media seems in many ways to have expanded the reach of environmental activists by allowing them to draw attention to their campaigns, mobilize support, and even level the political playing field somewhat, there are also unique limitations and challenges to consider. People who hear about environmental issues online may feel that they have done enough to address the problem by reading a blog post and then signing an electronic petition or sharing a link on their Twitter feed. However, in most cases, such "clicktivism" is insufficient. Actual volunteering or activism in the traditional sense of participating in rallies or boycotts is required to make substantial progress. Critics of digital activism claim that real change relies on strong commitment and personal relationships, which may be lacking in online networks of people who do not interact offline.

Another challenge lies in ensuring that information about environmental issues reaches not just those who are already concerned with the problem, but also those who may be unaware of it, yet are likely to be sympathetic. Social media are often considered to be very efficient because users are able to select sources based on perceived relevance to their interests, rather than sifting through content that they may find uninteresting. However, when users are only exposed to voices with which they already agree, or only hear the concerns of those who share their interests, the result is an echo chamber that keeps dissenting ideas and new information out of view. Paradoxically, the efficiency of social media then becomes a limitation.

A final challenge that may limit the ability of social media to affect substantial environmental change is the phenomenon known as astroturfing, or the construction of fake grassroots campaigns. The problem is not a new one; polluting

or otherwise problematic industries have long employed the tactic of creating front groups or fake citizen organizations to counter claims advanced by environmentalists. The new reach of social media has simply expanded the practice and allowed certain corporations or other parties with antienvironmental agendas to build Web sites that refute the arguments leveraged against them. The U.S. coal industry used this tactic extensively during its push to rebrand its product as “clean coal,” establishing front groups and Web sites like Americaspower.org and Cleancoalusa.org. Content from such sites, which may be misleading or even deceptive, can then be distributed via social networks, where its legitimacy often goes unchallenged (partially because of the existence of digital echo chambers, and because users tend to trust those who are in their social media circles). Another example of digital astroturfing is the 2006 YouTube video *Al Gore's Penguin Army*, which made fun of the former vice president and his documentary *An Inconvenient Truth*. The video appeared amateurish, but was revealed to have been produced by the DCI Group, a conservative lobbying and public relations firm.

The interactivity that characterizes Web 2.0 technology gives social media users the opportunity to participate in dialogs with those who are geographically distant and those who are socially removed (e.g., figures who occupy positions of economic or political power). News about the environment can now spread quickly through many digital channels. Eco-activists have taken readily to digital technology, hoping to raise awareness of environmental problems and to organize and mobilize support for green causes. Yet, while new cultural venues like Facebook and the blogosphere have perhaps created a more democratic space for political debate, these limitations must be kept in mind when considering the overall utility of social media networking to the environmental movement.

Estrada, Joseph

Joseph Estrada was the 13th president of the Philippines who was ousted among allegations of corruption in 2001. Social media was used to coordinate large protests that demanded that the president be held accountable for his crimes and that local media accurately report on the presidents’ crimes and trial. The social media–driven protests led to the ousting of President Estrada.

On May 11, 1998, in the second set of general elections since Philippine democracy was restored in 1986, 28 million voters went to the polls to choose a president, a vice president, 12 senators, over 200 members of the House of Representatives, and more than 17,000 local officials. Despite being called a complete circus, it was the freest, fairest, and least violent election in Philippine history. Joseph Estrada won the presidency by campaigning to the lower classes with promises to narrow the widening income gap between the rich and poor. Estrada, who previously served as vice president of the country, won the election with 40 percent of the vote in a field of 11 candidates. Unlike most of his opponents, Estrada did not possess any legal or military expertise, nor did he speak fluent English. The Robin Hood roles he played in his 33-year-long career as a film star enhanced his image as a companion of the underprivileged. He served as president from 1998 until 2001.

In October 2000, Luis “Chavit” Singson, the governor of a province in the Philippines and a close friend of the president, alleged that he had given Estrada 400 million Philippine pesos (more than \$9 million) as a payoff from an illegal numbers game commonly played in the Philippines, as

well as 180 million Philippine pesos (more than \$4 million) in a scandal involving the cover-up of Singson's alleged misuse of millions of pesos from public funds. The allegations against Estrada resulted in an impeachment suit brought against him, in which he pled "not guilty."

On the evening of January 16, 2001, the impeachment court, composed primarily of senators, decided not to accept new evidence that would incriminate the president on charges of receiving millions in payoffs. That decision by the Senate confirmed what many Filipinos were afraid of—that the judges were leaning toward acquitting Estrada. Within an hour after the court had adjourned that night, citizens flooded the streets in protest, demanding Estrada's resignation. By midnight, thousands of citizens had gathered on a large road called Edsa (an acronym derived from Epifanio de los Santos Avenue, a major highway connecting five cities in metro Manila) to protest the Senate vote. Edsa was the site of the 1986 "people power" revolt against then-dictator Ferdinand Marcos. The protests lasted January 17–20, 2001, ending after Estrada was forced to resign when the Supreme Court declared that the seat of the president was vacant.

Estrada maintained that he never resigned, but the new government created a special court and arrested him in April 2001. Filipino supporters of Estrada marched on Edsa, demanding his release and reinstatement. However, this time mobile phones and social media brought protesters together. Short messaging service (SMS) messages were the key element in mobilizing protesters and keeping them informed. Although traditional media such as newspapers, radio, and television stations were covering the events, they could not keep up with the speed in which information traveled from person-to-person via SMS. Nor were the traditional forms of media as interactive as SMS, which has the ability to link individual users to each other and present real time information about when and where the protests were occurring.

In addition to the SMS messages, the Internet was a key element used in the protests. Web sites and e-mail groups were set up, and organizers used these to reach agreements on issues and mobilize people to attend the rallies. Protesters continuously posted updates on the Web sites so that citizens who were unable to participate or

Former president of the Philippines Joseph Estrada (right) with former U.S. Secretary of Defense William S. Cohen (left) at the U.S. Pentagon in July 2000. Estrada was forced to resign in 2001 after large protests fueled in part by text messages and social media.

were abroad were able to be involved and up-to-date. In addition to disseminating information, the Internet was home to virtual rallies. According to Sheila Coronel, it is estimated that as many as 70 million messages were sent during the weeklong protest, and it has been referred to as a "multimedia revolt."

With the help of SMS and the Internet to rally participants, protesters eventually made their way to the presidential palace, where police and the military responded with force. Violence erupted and many protesters were badly injured and arrested, including some politicians, before the protests came to an end. The uprising came to be known as EDSA III, but did not result in the release of Estrada. Instead, he was put on trial at a

special appellate court called the Sandiganbayan. After a lengthy trial lasting from 2001 until 2007, Estrada was found not guilty of perjury, but guilty of plunder. He was sentenced to *reclusión perpetua* (a replacement for the death penalty, synonymous with life imprisonment). All of the co-accused were acquitted. Later in 2007, Estrada was pardoned by President Gloria Macapagal-Arroyo and released after almost seven years in prison.

After being pardoned, Estrada made a statement to the Filipino people explaining that he was once again willing and able to help improve the lives of citizens, especially the lower class. He admitted that he had made errors while in office, but again declared that he was innocent of any corruption. He then began touring the country, thanking people for their support and distributing food, medicine, and clothing. In the 2004 Global Transparency Report, Estrada was listed 10th on the list of the World's All-Time Most Corrupt Leaders in the World. However, that seemed to have little impact on public perception of Estrada, who in May 2013 was elected mayor of Manila.

Ethics of Social Media in Politics

Politics has been reshaped in the era of social media. Today, every tweet, blog post, Facebook

update, wiki entry, and YouTube video can determine how one is perceived. Social media make it possible for any user to act as a reporter, editor, message creator, and distributor. This is a significant change from the past, when a select group of trained media professionals had this power and operated within an institutional environment with clearly defined codes of ethical conduct.

Ethics is broadly defined as moral principles that govern human behavior, in other words, a system of values by which a person can determine what is fair, just, right, or wrong. Social media have tested traditional theories of media ethics. They have challenged accepted notions of privacy, identity, authorship, and credibility; they have blurred the distinctions between public and personal communications. These unique features of social media pose many ethical dilemmas and prompt the question whether established ethical standards are appropriate and adequate to address them. In terms of social media and their relationship to politics, two distinct sets of issues must be considered: The ethics of using social media to further political agendas and to achieve political ends, and the ethics governing news media coverage of these same activities.

Social Media for Political Activities

For decades, political campaigns have looked to new technology to reach voters and win elections. The race for public office now includes viral e-mails and text messages, constant updates on social networks such as Facebook and Twitter feeds, user-generated videos, YouTube debates, and creative online advertising strategies to generate attention and raise funds. These media also act as trust filters for people who seek to manage the deluge of information and find credible sources. Data from the Pew Research Center's Internet and American Life Project show that 36 percent of social networking site users say that such sites are very important to them in keeping up with political news, and 26 percent of site users find them important avenues to recruit people to get involved in politics and to debate political issues.

Protests organized through the use of social media in Iran, Ukraine, Moldova, Egypt, and in other countries during the Arab Spring also highlight the power and dangers inherent to social media. In this environment, it is necessary to

revisit important questions of ethical conduct in using social media for political activities.

When people post something online, try to provide an accurate report, blog a fair commentary, edit video footage, or alter digital photographs, they are involved in making choices about what others will see or hear. While the moral nature of these choices may not always be apparent, ethical or unethical choices are inevitably made because some kind of ethical standards are being assumed, owned, applied, or avoided. Ethical conduct in relation to social media covers a wide range of issues such as privacy, surveillance, trustworthiness, and information rights.

Ethics in Communications

Questions about the role of ethics in communications date back centuries. Some of the earliest discussions are found in Aristotle's treatise on the role of morality, truth, and justice in rhetoric. Following in this tradition, it has been proposed that rhetoric involves a presentation of values. Over the years, political and communication ethics have drawn on a range of established philosophical principles of ethics.

Within philosophy, there are three broad areas of ethics: meta-ethics, normative ethics, and applied ethics. Meta-ethics encompasses discussions about the nature of ethics and moral reasoning. Normative ethics involves theories that seek to provide action guides for moral behavior and procedures to answer the practical question of what a person should do. Applied ethics is situated within specific disciplines such as business, bioethics, engineering, or communications. The Hutchins Commission's social responsibility framework is an example of applied ethics that relies on multiple perspectives and has been used to guide ethical conduct among journalists and other communication practitioners. Some of the most frequently used frameworks in media ethics are normative theories such as Aristotle's ideas about virtue and the golden mean, Immanuel Kant's categorical imperative, William David Ross's self-evident duties, John Rawls's veil of ignorance, John Stuart Mill's principle of utility, and the ethics of care.

Some theories such as virtue ethics have long histories; they have been advocated since the time of Socrates. Virtue ethics emphasize character over conduct. Aristotle created his principle

of the golden mean based on the virtue of moderation: When confronted with a moral choice, moderation between the extremes of excess and defect is ideal. Virtue ethics is the foundation for urging media professionals to provide fair and balanced coverage of issues. Employing Aristotle's virtue ethics framework, one could argue that a virtuous individual should not lie or help conceal illegal acts for a political candidate, engage in deception online, or blog and tweet information that is misleading.

Instead of relying on virtuous character, theories such as Kant's categorical imperative, Ross's self-evident duties, and Rawls's veil of ignorance state that decisions should be made after considering one's duties and the rights of others. Kant's categorical imperative asserts that there are inviolable moral laws that are absolutely binding regardless of personal interest or desire. Kant's framework requires people to ask themselves how it would be if their rule of conduct became a collective law. This would allow them to discover their duty.

Ross agreed with Kant that ethics was a matter of doing one's duty. He assumed that people had an inborn standard of right and wrong and identified six self-evident duties ranked in order of importance: fidelity (to do no harm to others), reparation (make amends to those one has hurt), gratitude (repay those who have helped one), justice (to treat people as well as they deserve), beneficence (to help others when possible), and self-improvement (to better oneself). While Kant claimed all duty was absolute, Ross regarded duties as conditional and imagined times when, to fulfill one obligation, a person might have to violate another. In such cases, he argued that a person should act to fulfill the highest obligation.

Diverging from the above two approaches, Rawls held that moral acts are those that people would all agree to if they were unbiased. Rawls assumed that, given a fair procedure for reaching a decision, rational people would agree to give each other as much freedom as possible. In order to discover ethical rules that would promote such freedom, Rawls created the fiction of an ethical discussion held before people enter the world. Everyone would be required to agree on binding rules of behavior before they had any idea of which place in society they would occupy.

Social Media and Journalism

Using Kant's framework of duty without exception, it could be argued that journalists, individual politicians, and their campaigns and staff are bound by duty to be truthful, honest, and fair. Failure on their part to do so would destroy people's trust in the entire information environment. Political reporters have sometimes been advised to use Ross's category of duties to determine the most ethical course of action when faced with ethical dilemmas. Professional codes of ethics published by the Society of Professional Journalists, the American Advertising Federation, the Public Relations Society of America, and the National Communication Association often draw on multiple ethical theories to emphasize duties such as seek the truth, be honest, minimize harm, reject improper influences, and be accountable.

The Society of Professional Journalists guidelines, in particular, articulate a clear and comprehensive set of requirements for what constitutes ethical behavior in the professional press corps—and which do not apply, obviously, to the penumbra of new media nonprofessionals who populate Twitter, Facebook, and the blogosphere.

While these ethical theories and codes have traditionally been applied to mass media professionals, the rise of social media, the consequent democratization of journalism, and the message creation processes pose many challenges. The central dilemma is how to hold nonprofessional social media users accountable to ethical standards because they may not be familiar with or have much regard for such principles.

To address this dilemma, consequentialist theories have been used to argue that the morality of an action is contingent on the action's outcome or result. Mill's utilitarianism, which holds that an action is right if it leads to the most happiness for the greatest number of people, is one frequently used consequentialist theory. The Hutchins Commission's social responsibility ethics draw upon utilitarian arguments to argue that the media have a moral obligation to consider the overall needs of society when making journalistic decisions in order to produce the greatest good. Based on utilitarianism, moral conduct in the use of social media is identified as conduct that benefits the most number of people. This can be seen in justifications of cases such as Congressman Anthony

Weiner's hacked Twitter account. In that case, the public's right to know was offered as a reason for violating the privacy of a public official.

Finally, the framework of ethics of care is seen as particularly relevant to moral conduct in the use of social media. Ethics of care, or relational ethics, asserts that morality arises out of the experiences of empathy and compassion and emphasizes the importance of interdependence and relationships in achieving ethical goals. In this context, social media users have to exercise their moral imaginations and place themselves in the position of others to decide whether a particular course of conduct would be ethical.

Given the multiplicity of frameworks, there is disagreement about what constitutes ethical action in the context of social media. This is particularly true within the realm of using social media for political activities. Some of the ethical questions that arise in this context are these: How can people balance the benefits and harms that arise from technologies that allow rapid and widespread sharing of information across networks when inaccurate information and lack of context is rampant? Do political figures have a right to privacy when they post images and information voluntarily to public sites online? Do such rights exist if politicians post morally compromising information using quasi-public sites such as Twitter? Is it ethical to hack into social media accounts of such politicians to share information that one believes the public ought to know? To what extent do public figures have a right to control the images and information available about them online? If public figures can control information on social media, would this limit the information rights of others? Should legislative candidates be friended by lobbyists on social networks such as Facebook, and can they be fined for improper fund-raising tactics if it involves just a link posted online? Popular protests organized through the use of social media raise issues about the ethics of encouraging people to voice dissent in an environment subject to state surveillance and the right of people to be able to choose how to act after freely considering consequences.

WikiLeaks

Some of the traditional tenets of ethical communication, such as maintaining accuracy, not citing or

quoting something out of context, not distorting by going beyond the facts, and not linking a person or idea with something that may induce unwarranted deprecation or loss of prestige, have been upended in an age when every reader, listener, and viewer can create mashups, link, like, forward, and retweet content to others. The case of WikiLeaks, an online, international, not-for-profit organization publishing secret information such as U.S. diplomatic cables, news leaks, and classified media from anonymous sources, has highlighted the challenges of controlling information. WikiLeaks has released a wide variety of information over the years, some of it aimed at exposing important government cover-ups and others that have embarrassed government officials and complicated diplomacy. The sources that provided information to WikiLeaks have used utilitarian arguments to justify breaking laws to circulate classified information. This case also raises issues about who has the right to control information and freedom of the press and what that means in the age of social media.

Blogs

The need for revisiting and formulating new ethical standards for accuracy, responsibility, and information rights is also highlighted in the case of blogs. Blogs began as an online setting for personal logs but have evolved into public avenues for political news and commentary, among other things. The collective domain of blogs is called the blogosphere. Blogs offer an opportunity for people who are not professional journalists to act as political reporters and commenters. This open, unedited blogosphere is just a link away from the public sphere of political news. In addition to issues of journalistic ethics, blogs also raise the issue of who is ethically responsible for comments made as blogs offer readers the unique ability to interact and dialogue with authors. Should a blogger be held responsible for libelous, plagiarized, or untruthful remarks made by commenters? If a blogger deletes these comments, is he or she restricting the free speech rights of the commenters? Should bloggers be able to control this information?

YouTube

Sites such as YouTube have altered the ability of campaigns and candidates to control messages. While unauthorized campaign videos and

hard-hitting debate questions from YouTube users are changing the political scene, the ethical rationale is shaky for YouTube videos of “gotcha” moments. There are many videos of politicians speaking in unscripted moments that take on new life online.

From a utilitarian perspective, it can be argued that any views that public figures share should be widely circulated because they serve the greater good of educating citizens, who have a right to know the true views of their representatives. However, such acts do hurt the individuals featured in such videos; the ethic of benevolence demands that individuals respect the dignity of others and refrain from hurting them. Besides, few creators of such videos are transparent about the sources and context for such information or their purposes and motivations.

Because social media users can create false identities, the norms surrounding authorship and taking responsibility for content are also challenged. It is difficult to hold someone accountable when there is no real identifiable individual or organization claiming ownership. It is possible for journalists, bloggers, and fact-checkers to correct any mistakes through their own stories. However, there are many challenges to the established norms of verifying accuracy and removing erroneous content when such content can be instantaneously created and shared in an environment with no editorial control, where people feel compelled to be fast and be the first to post something online. Because such content exists for a long time in the public sphere, future audiences may not be able to judge the credibility of the source; they may not have the time or resources to assess the veracity and intent behind the messages.

Text Messaging and Twitter

These ethical problems are also prevalent in text messages and tweets. Twitter limits users to 140 characters per message. Though hashtags provide some context and the rich detail panes allow users to add photos, videos, and other content, a single message does not allow users to add qualifiers, express nuanced stances on political issues, offer explanations, or develop arguments. This can lead to misunderstandings or misrepresentation of comments. These issues were highlighted when CNN fired one of its Middle East political reporters,

Octavia Nasr, after she tweeted about the death of a Hezbollah leader. The limitations of Twitter as a medium lead to questions about how ethical it is to judge a message and its sender without adequate context, a basic tenet of media ethics.

Facebook

Social networking sites such as Facebook also pose many ethical dilemmas in relation to political advertising, privacy, and fund-raising tactics. Though social networking sites started as tools to build and maintain relationships, they have evolved into political communication tools. There have been ethical controversies about online entities offering user registration information to facilitate targeted political advertising. Facebook has been at the center of these privacy-related controversies.

Facebook allows campaigns to target advertisements on the basis of political beliefs reported by users. Data mining, harvesting location-based information from mobile devices, and complex algorithms allow political campaigns to combine voter lists, factors not publicly available such as income, and purchasing habits with anonymous cookies on particular users' browsers to target voters online. This raises ethical issues about informed consent, ability to opt out, and notifying users about tracking.

Social networking also blurs lines between personal and public lives and challenges the rules governing them. Recently, two Kansas legislative candidates who had been friended by lobbyists on Facebook were fined for improperly posting announcements about fund-raisers. Kansas prohibits elected officials and candidates from soliciting campaign contributions from lobbyists while the legislature is in session. The legislators claimed they did not know that the people who friended them were lobbyists. Some cities now require officials such as mayors to maintain three separate social media accounts: personal, city hall, and a political campaign account. The rapid evolution of social media and its expanding role in politics indicates that there will be more debates about ethical questions in the years to come.

Europe

Following innovative uses of social media platforms in recent election campaigns in the United States, various individuals and groups have started employing similar political communication technologies and techniques in Europe. Social media is thus becoming increasingly important in the communication between political candidates and the electorate, as well as between politicians and their constituencies, in many European nations and at many levels of the European Union. However, research shows that elections on the European continent are not becoming dominated by Web 2.0 practices, as traditional media still play the most significant role in conveying electoral messages. Moreover, studies document that while politicians across Europe are now relatively keen to utilize social media, they often remain in a broadcasting mode because social media is for them a way to provide information to the public, rather than a means for engaging with the public.

United Kingdom

In Great Britain, social media has been spreading into political life. In March 2003, Tom Watson, a Labour Party member of Parliament, was the first British politician to begin a blog to keep people informed about his legislative endeavors, and subsequently blogs have become a relatively well-established communication tool in the British political sphere. Meanwhile, political blogs have

become more dialogical, although some commentators assert that the interactive potential of such blogs has not yet been fully realized, largely because: many bloggers do not allow readers to comment on their posts; those that permit comments receive very few responses; and when public comments are made or questions are asked, these are rarely acknowledged or answered.

As Facebook has emerged as the most popular social media platform of the globe, it has also been used with greater frequency for political purposes in the United Kingdom. In 2009, only under a quarter of British members of Parliament were active on Facebook, whereas the number grew to one-third in 2010 and over half in 2011. However, as in the case of blogs, some observers contend that British politicians mostly use Facebook for one-way communication, to inform the public, rather than for two-way communication, to engage with the civil society. In March 2007, Alan Johnson, another Labor Party member of Parliament, was the first British politician to post on the microblogging site Twitter, and the number of members of Parliament posting on Twitter rose dramatically from two at the end of 2008 to almost 100 by the end of 2009 to over 200 by the end of 2010.

In 2011, the House of Commons voted to allow its members to tweet from inside its headquarters. In the 2010 elections in the United Kingdom, several candidates did question and answer events on Twitter, and since then, many members of Parliament, national and local public officials, and political advisors have followed. However, the utilization of Twitter by British political figures has been criticized as much as their blogging or Facebook activity. For example, in a 2012 report, Graeme Baxter and Rita Marcella affirmed that in the 2010 election campaigns in the United Kingdom, many candidates appeared more interested in discussing the weather than any important national and local issues raised by voters on Twitter and other social media, and stated that a large portion of the electorate expect parliamentarians, policy makers, and other political actors to have more, and more meaningful, exchanges through Twitter and other social media.

Germany

In Germany, social media and politics are also interrelated, with mixed results. On one hand,

politicians are discovering the benefits of social media, and communication through social media is becoming increasingly important in political life. On the other hand, campaigning still takes place largely offline, much of it through television, and politicians still turn to social media mostly in attempts to appeal to younger voters, often with messages that do not have policy implications.

In the 2005 Bundestag election campaigns in Germany, approximately 300 political blogs were established by candidates, party organizations, politically interested citizens, or journalists, and over half of the electorate in Germany accessed blogs. However, as in Great Britain, few of the blogs allowed readers to comment, so they were active, rather than interactive. Additionally, as a 2007 study by S. Albrecht, M. Lübcke, and R. Hartig-Perschke found, a year after the elections, only about 100 of these blogs were still functional, whereas the others had not been kept up-to-date since the elections, or had been discontinued.

By the 2009 elections, German political parties and their candidates shifted their attention to other social media platforms such as Facebook and Twitter, the German portal StudiVZ, and professional networks LinkedIn and Xing. The number of clicks that candidates' social media profiles received soared, and Angela Merkel, who was running for re-election as chancellor, led the field in social media popularity with over 15,000 friends on Facebook and almost 70,000 friends on StudiVZ, more than double as many as her challenger Frank-Walter Steinmeier.

Market research showed that early in 2009, within the German population over 70 percent were on Twitter at least once, but only 15 percent were on Twitter over three times; whereas later in 2009 (close to the elections), Twitter activity intensified; and in the last six weeks before the elections, over 100,000 tweets with political content were published by candidates, their advisors, party representatives, and the general public.

Today, Angela Merkel has nearly 250,000 social media followers, she frequently sends text and video messages on social media networks, and almost 90 percent of German parliamentarians have a social media presence. A majority of politicians in Germany recognize that social media provide important public communication tools, yet some experts still doubt that intense

social media activity represents an indicator of political success.

France

In France, social media was still of little importance in the 2007 presidential elections in which conservative Nicolas Sarkozy defeated his socialist opponent Ségolène Royal, with under 100 political blogs maintained mostly by political observers, and with most campaigning taking place through television and to some extent through candidates' Web sites. Royal, for example, launched her campaign by publishing on her Web site 10 chapters of her political manifesto *Désirs d'avenir* (Desires for the Future), whereas many of her opponents in the Socialist Party as well as Sarkozy were reluctant to use the Internet in their campaigns.

As president, Sarkozy went from declaring social media as detrimental to democracy for enabling infringements on intellectual property, and proposing heavy government regulation on social media in terms of online copyright and privacy, to having close conversations with Facebook Chief Executive Officer Mark Zuckerberg at the G-8 Summit in 2011, and starting a conjugated social media presence before announcing his intention to run for re-election in early 2012.

In February 2012, Facebook received public disapproval in France for deliberately helping Sarkozy boost his online image by creating for him not only a brand new Facebook profile, but also the first ever, among French politicians, Facebook timeline. This timeline was extensive, with over 700 pictures dating back to Sarkozy's birth, but also with many notable omissions, including the 2007 controversial visit to France at Sarkozy's invitation of then Libyan dictator Muammar Qaddafi, Sarkozy's 2007 speech in Dakar in which he stated that Africans had never really entered history, his relationship with his former wife Cecelia Attias, and his romance with his current wife Carla Bruni.

In February 2012, the new Twitter feed @NicolasSarkozy was also broadly publicized by the Sarkozy campaign, but it provoked additional critiques after the campaign attempted to silence spoof Twitter accounts, reminding the French public of Sarkozy's plans to censor social media. Meanwhile, Sarkozy's opponent François Hollande was

said to have studied Barack Obama's social media strategies and to have put approximately 10 percent of his budget in his social media activity. This included social networking as an integral part of campaign communication, frequent responses to social media supporters, and intense mobilization appeals and fund-raising through social media. Hollande's social media strategy, in correlation with other strategies, played a role in his election as president of France.

Northern Europe

Social networking through such platforms as Facebook and Twitter is recording near explosive growth in northern European countries including Sweden, Denmark, Finland, Iceland, and Norway. People in these countries have quickly become accustomed to receiving and sharing information about entertainment, sports, commercial products, and job-related issues through social media. Major steps are also being taken toward using social media like Facebook and Twitter as an integral part of public and political communication. In February 2012, the first picture of Sweden's newborn princess was first published on Facebook, rather than in a traditional media outlet, creating a big buzz as within 24 hours it received almost 25,000 "likes" and over 5,000 comments and it was shared tens of thousands of times.

In Denmark, according to the constitution, the prime minister can call the elections at any date, providing it is no later than four years from the previous elections, and in 2011, the Danish prime minister shared the news about the election date on his Facebook profile before even announcing it live on television. Finland has the highest level of Internet penetration and usage among European nations, and many Finnish political candidates in the 2012 elections employed communication through social media sites to reach broad audiences at costs lower than for campaigning through traditional media. In the Finnish presidential race in particular, as Tarja Halonen had already served her maximum of two terms as president and all eight political parties represented in the Parliament had nominated a candidate, campaign teams strived to make use of all available means, including a strong presence on social media networks, to appeal to the electorate.

Pekka Haavisto of the Green League had an especially savvy social media strategy, including coordinated messages, responses to followers' questions, and fund-raising on social media platforms. This Obama-style strategy helped Haavisto to surpass six other candidates and gain second place in the first election round (thus becoming the first ever candidate of the Green League to make it to the second election round in Finland), but failed to lead to his success in the second round, as Sauli Niinistö of the National Coalition Party won the election. In both the 2009 and the 2013 elections in Norway, many candidates found blogging as well as a presence on Facebook, Twitter, and YouTube as useful tools in campaigning, although some issues regarding the use of social media by politicians also arose, for example, the rejection of a mayoral candidate by her party in 2013 after she posted racist comments on her Facebook page about a Eurovision contestant.

Southern Europe

Across southern Europe, social media networking is also making inroads into politics, although doubt still remains about its contribution to electoral success. In Spain, where the law determines the dissemination of political content in traditional media during electoral campaigns, social media have gained importance, especially for the representatives of new parties, regionalist parties, and minority parties. According to a study supported by the Barcelona Media Foundation, in the 2011 elections in Spain, parties with limited traditional media coverage such as United Left—the Greens (IU-LV) and Union, Progress, and Democracy (UPyD) generated more social media content and had higher content propagation within social media than parties with greater coverage in mainstream media, especially the People's Party (PP) and Spanish Socialist Workers' Party (PSOE). Although the two main Spanish parties (PP and PSOE) won the largest number of votes, the third parties (IU-LV and UPyD) won more votes than in past elections and are becoming established as a viable political alternative.

Most important, in the months before the 2011 elections in Spain, the 15M movement, or the Indignados movement, formed of various citizens' associations including Democracia Real Ya! (Real Democracy Now!), Juventud Sin

Futuro (Youth Without a Future), and NoLes-Votes (Don't Vote Them), employed social networking platforms such as Facebook and Twitter to mobilize Spaniards to protest against an unjust economic model which favors the rich, but in situations of economic crisis cuts opportunities for the poor, and an unfair political system in which governing parties are subordinated to economic power. The movement, comparable with those which prompted the Arab Spring, gathered an estimated 8 million people in street protests, and did not ask the electorate to vote one way or another, but rather called for manifestation of public distrust in the leaders of big parties and demand by the public of a true democracy beyond the electoral show.

Following the Spanish model, an Indignant Citizens Movement also emerged in Greece, organizing across the country, with the aid of social media networks, street demonstrations, and general strikes to oppose social cuts imposed by the government as measures against the economic crisis and to protest the corruption of mainstream politicians focused on protecting the financial elites that provoked the crisis, rather than the population affected by the crisis.

In Italy, comedian and blogger Beppe Grillo launched the Movimento 5 Stelle (Five Star Movement) or M5S through a powerful presence on social media with his anti-establishment message and through rallies across the country prompted through social media. Grillo announced through social media and at rallies that traditional political parties are dead because they are elitist, corrupt, and closed, and regular citizens do not trust them any longer. The M5S movement became a party with an electoral prospect, and in the 2010 regional elections it had four councilors elected, whereas in the 2012 local elections it received the third-highest number of votes overall and won the mayoral election for Parma. The party made further gains, and in the 2013 general elections it won over 25 percent of the vote for the chamber of deputies.

Central and Eastern Europe

In central and eastern Europe, social media activity has also been included among the communication strategies of political figures and among the means for political uprising. In recent elections

Protesters from the Spanish 15M, or Indignados, movement demonstrating in Valencia, Spain, on May 15, 2011. The movement, which benefited greatly from online organizing like the Arab Spring, turned out an estimated 8 million people in street protests in a manifestation of public distrust in the leaders of Spain's largest political parties.

in Bulgaria in 2009 and 2013, Romania in 2009, Hungary in 2010, and Poland in 2011, the global trend of employing social media in political campaigns has caught on. But in addition to the social media presence of political candidates and their staff, publishing reports and speeches, and appeals to donors and voters, there has been a strong social media presence of election monitoring groups aimed at offering access to statistics and providing opportunities for debates. Politicians in the region are also active on social media after the election seasons. Most presidents and prime ministers of the central and eastern European countries that are members of the European Union now have active Facebook and Twitter accounts, as do the highest officials in Russia and Ukraine. Dmitry Medvedev's 2 million Twitter followers are hardly a match for Barack Obama's over 25 million Twitter followers, but nonetheless represent a record for the region. Medvedev is said to tweet, both in Russian and in English, yet his tweets are mostly about state visits, and he

raised criticism for using Twitter to congratulate Arnold Schwarzenegger on his birthday, rather than for answering questions from the public.

Most other officials in the region do not communicate directly through social media, but rather hire public relations professionals to manage their social media presence. Such experts typically disseminate uncontroversial messages, although there are exceptions, such as the message posted by the team of current president of Romania Traian Basescu, formerly Minister of Transportation and a marine officer, claiming that the *Titanic* would not have sunk had Basescu been its captain. Few officials in the region engage with citizens through social media, yet there are some like Hungarian President Viktor Orbán and Polish Prime Minister Donald Tusk who have accustomed the public to holding "office hours" through Twitter. Some politicians have also used social media to direct public sentiment against their adversaries, for example, Serbia's Minister of Economy and Finance Mladan Dinkic, who in 2012 tweeted a picture of the empty

benches of the opposition forces during parliamentary discussions about economic measures, which led to civil society critiques of the opposition politicians but also to a more active involvement of the opposition in the economic discussions.

Protests against political corruption and social injustice, inspired by the Arab Spring and the various movements in southern Europe, and mostly fueled through the Internet and social media platforms, have also gained momentum in eastern European countries. In Romania in 2012 and in Bulgaria in 2013, following social media calls to action by various activist groups, hundreds of thousands of people took to the streets in the capitals and in other parts of these countries, raising their voices about the economic difficulties of the majority of the population and the corruption of many of the politicians.

The involvement of social media in European Union elections and administration is smaller than in the elections and political processes of particular European nations. A recent study shows that under 30 percent of Euro parliamentarians participate in online forums, whereas over 50 percent of them have Web sites, and over 75 percent of them use the Internet for gathering information. While some European Union representatives and institutions keep Facebook and Twitter accounts, generally elected officials of the European Union engage much less with their constituencies on social media than elected officials of various nations of Europe, and people in Europe pay significantly less attention to online developments in elections and political decision making at the level of the European Union than at the level of their particular nations.

Social media have grown in importance for political processes in Europe, including for election campaigns, communication of elected officials with their various stakeholders, and public protests. However, while social media offer a cheap and flexible alternative to traditional media, traditional media still maintain primacy in political communication in Europe. Additionally, social media presence often involves one-way communication from politicians to their followers, rather than interactive two-way communication.

Evolution of Social Media

Social media are Internet-based applications that build on the ideological and technological foundations of Web 2.0—the concept of the World Wide Web used as a platform where content and applications are continuously modified by users in a participatory and collaborative manner. Social media enables the creation and exchange

of user-generated content, or all forms of media content that are publicly accessible and created by end users. The social media landscape today looks significantly different from its humble beginnings; in the last few decades, it has undergone a marked evolution.

1930s

In 1935, new machines called Notificators, with “robot” message boards, were installed in the streets, stores, railroad stations, and other public places in London. These would aid persons who wished to make or cancel appointments or inform friends of their whereabouts. Individuals could leave messages for a small sum on these message boards, which appeared on a window for at least two hours so that the person for whom it was intended would have sufficient time to observe the note at the appointed place. Notificators are considered to be the first predecessor of Twitter.

1950s

The social aspect of social media was born on line, that is, on the phone. In the 1950s, technophiles and information addicts used telephone networks as rogue ways to mass communicate, and the first podcasts took place on hijacked corporate phone lines. These early social media explorers built boxes, or homemade electronic devices, that could generate tones, which allowed them to make free calls and get access to the experimental back end of the telephone system. They sniffed out telephone company test lines and conference circuits to host virtual seminars and discussions. The first blogs and podcasts were a result of hacked corporate voice mail systems called codelines, where phone phreaks would hack into unused mailboxes and set up shop until they were found and thrown out. Phone phreaking was not essentially motivated by fraud but rather a telecom monopoly that made telephone use expensive.

1970s and 1980s

Usenet is an online discussion system that was conceived by Duke University graduate students Tom Truscott and Jim Ellis in 1979 and was established in 1980. On Usenet, users read and post messages, articles, or posts, collectively termed *news*, to one or more categories known as

newsgroups. It is mostly responsible for the development of newsreader clients, which are the precursors to RSS (rich site summary or really simple syndication) feed readers used to follow blogs and news sites today. Discussions are threaded with modern news-reader software, though posts are stored on the server sequentially.

Usenet is distributed among a large, constantly changing conglomeration of servers that store and forward messages to one another in news feeds. Individual users read messages from and post messages to a local server operated by their Internet service providers, universities, or employers. Usenet has no centralized server or dedicated administrator, setting it apart from most bulletin board systems (BBS).

The first electronic bulletin board system (BBS) was developed and made accessible to the public in the late 1970s by Ward Christensen. He coined the term *bulletin board system* as a reference to the traditional cork-and-pin bulletin board where people can post messages, advertisements, or community news. The first BBSs were small servers powered by personal computers attached to a telephone modem, where one person could dial in at a time and get access.

Until the mid-1990s, most BBSs were run free of charge by the system operator, or SysOp, while other BBSs charged their users subscription fees for access or were operated by businesses as a means of supporting their customers. The functions included social discussions on message boards, community-contributed file downloads, and online games. In the 1980s, the social media scene acquired an underground flavor. A fair percentage of bulletin boards had secret, adult, or pirate software rooms, and handles, or online pseudonyms, were the norm. BBSs can be considered the first social communities connected online.

1980s and 1990s

After BBSs came online services like CompuServe and Prodigy, the first large-scale corporate attempts to bring interactive, social, online experience to the masses. These services rose to popularity along with BBSs and catered to a more corporate and mainstream, home-user client. CompuServe was the first company to incorporate a chat program, CB Simulator, into its service in 1980 but was infamous for its high charges of \$6

per hour, plus long-distance telephone fees, adding up to almost \$30 per hour. Prodigy launched nationwide in 1990, growing quickly in popularity for its color interface and lower cost.

America Online (AOL) started as an online service too and gained critical mass with aggressive compact disc (CD) promotions and direct-mail campaigns. AOL also did one of the most epic product placements of all time in the 1998 film *You've Got Mail*, bringing social online culture and romance into the Hollywood mainstream.

Although the Internet existed as a network since the late 1960s, the World Wide Web became publicly available on August 6, 1991. Tim Berners-Lee, an English computer scientist, is credited for developing this global information medium that users can access through computers connected to the Internet. The term is often mistakenly used as a synonym for the Internet itself; rather, it is a service that operates over the Internet. At the beginning of the 1990s, Internet access was available only to those with legitimate university, government, or military connections, and to hackers.

Around the mid-1990s, private Internet service providers (ISPs) started shop in most metropolitan cities in the United States. This gave millions of home users a chance to enjoy unfiltered, unlimited online experiences. Usenet became the primary center for most high-end discussions. Also, the first online social media etiquette standards, or netiquette, were proposed to stop rampant flaming—hostile and insulting interactions between Internet users—and keep the online environment civilized. By the late 1990s, Internet forums grew in popularity and began replacing Usenet and BBSs as the primary nexus for topical discussions.

In 1988, Internet relay chat (IRC) was developed by Jarkko Oikarinen. It is a protocol for real-time Internet text messaging and chat or synchronous conferencing. It is mainly designed for group communication in discussion forums called channels. It also enables one-to-one communication via private messaging and is used for data transfer including file sharing. When IRC was first made available, many people stayed logged into it constantly, using it to share links and files and keep in touch with their global networks, the same way Twitter is used today. In 1996, ICQ was developed by four Israeli technologists and was the first instant messenger (IM) system

for desktop computers. ICQ was quickly purchased by AOL and became a mainstream hit. It was partly responsible for the adoption of avatars, abbreviations such as LOL and BRB, and emoticons.

Napster was a peer-to-peer (P2P) file sharing Internet service that emphasized sharing audio files, typically music, encoded in MP3 format. It was cofounded by Shawn Fanning, John Fanning, and Sean Parker and went live in June 1999. Napster transferred the power of distribution from record companies to the consumer. Music started to freely flow across the Internet, stripped of hype and payola.

Napster thrived through 1999 and 2000, until it was declared illegal and was forced to filter out all the copyrighted content. Competing P2P applications like Limewire took Napster's place until BitTorrent technology arrived and provided a robust, centralized way to share files without being blocked. BitTorrent was designed by programmer Bram Cohen. While the technology itself is perfectly legal, the legality of many of its uses is being litigated in courts worldwide.

1990s and Early 2000s

SixDegrees was launched in 1997 and was the first modern social network. It was named after the six degrees of separation concept—the idea that everyone is on average approximately six steps away, by way of introduction, from any other person in the world. MacroView, the company that developed the site, was founded by Chief Executive Officer Andrew Weinreich. SixDegrees allowed users to list friends, family members, and acquaintances both on the site and externally; invitations were sent to external members to join the site. Users could send messages and post items on a bulletin board for people in their first, second, and third degrees, and see their connection to any other user on the site. At its height, the site had around 1 million fully registered members. In 2000, YouthStream Media Networks paid \$125 million to buy SixDegrees; it was around until 2001.

LiveJournal was launched in 1999 by American programmer Brad Fitzpatrick. It took a different approach to social networking from SixDegrees. While SixDegrees allowed users to create a predominantly static profile or page, LiveJournal was dynamic because it was built around constantly

updated blogs sharing the most recent thoughts and acts. LiveJournal encouraged its users to follow one another, create groups, and interact. This could be considered the precursor to the live updates feature in advanced social networks.

Massively multiplayer online role-playing games (MMORPGS) became popular in the early 2000s and have become social networks in their own right. They are a genre of role-playing video games in which numerous players interact with one another within a virtual game world. The most famous of these is World of Warcraft (WoW). Here, players interact both in the game world and on related forums and community sites. Social interaction within the game ranges from teams set up specifically for tactical reasons to friendships and romances.

2000s

Friendster was founded by Jonathan Abrams and Rob Pazornik in 2002. It was one of the first social networking sites to attain more than 1 million members at its peak. Friendster allowed users to contact other members, maintain those contacts, and share online content and media with those contacts. It was also used for dating and discovering new events, bands, and hobbies. Users could share videos, photos, messages, and comments with other members via their profiles and their networks. Friendster was acquired by MOL Global in December 2009 for \$26.4 million. In May 2011, Friendster repositioned itself as a social gaming site, discontinuing support for existing users' social data; its new focus is on providing users with entertainment and fun.

The first mainstream social network devoted to professional networking, LinkedIn was founded in 2003. One significant purpose of the site is to allow registered users to maintain a list of contact details belonging to people with whom they have some level of relationship, called connections. LinkedIn can be used in a number of ways. Users can upload their résumés or design their own profiles to showcase work and community experiences; it can be used to find jobs, people, and business opportunities recommended by someone in one's contact network; and employers can list jobs and search for potential candidates.

Myspace is owned by Specific Media LLC and pop star Justin Timberlake. It was founded in

2003 and by 2006 had grown to be the most popular social network in the world. It gained novelty by allowing users to completely customize the look of their profiles. Users could post music and embed videos from other sites on their profiles. Originally, Myspace allowed communication through private messages, public comments posted to a user's profile, and bulletins sent out to all friends of the user. In 2006, Myspace introduced Myspace IM, an instant messaging client that enables users to chat with their friends.

Facebook was founded in 2004 by Mark Zuckerberg with his Harvard University roommates. The Web site's membership was initially limited to Harvard students, but it quickly expanded, and by 2006, almost everyone could join Facebook. As of June 2012, Facebook had more than 955 million active users, most of whom access it on a mobile device. In order to be a user, one has to register; then one can create a personal profile, add other users as friends, exchange messages, and receive automatic notifications. Additionally, users may join common-interest user groups and categorize friends based on degree of intimacy or place of acquaintance. By 2005, the use of Facebook had become so ubiquitous that the generic verb Facebooking was introduced to describe the process of browsing others' profiles or updating one's own.

Other Social Networking Developments

As social networking grew, niche sites were launched for specific interest groups. There are now social networks for virtually every hobby, passion, interest, industry, and group. Ning is the first widely used platform for creating niche social networks. New users can either create social networks for any niche they choose or join any of the existing networks. Ning's biggest advantage is that it is user-friendly. A number of niche social networking sites have been developed by corporations; Autonomy is one example. It is a writers' network hosted by the United Kingdom division of HarperCollins that has attracted thousands of hopeful writers from all over the globe. While some of these niche networks have active groups, many do not and end up being shut down due to lack of activity.

Sharing photos, videos, and other multimedia content is a popular social media activity. Some

important sites associated with media sharing are Photobucket, Flickr, YouTube, and Revver. Photobucket was the first major photo-sharing site, launched in 2003. Flickr has groups and photo pools and allows users to create profiles, add friends, and organize images and video into photo sets or albums. It allows users to license their photos as well as retaining all copyrights. YouTube was the first major video hosting and sharing site, launched in 2005. YouTube's major social features include ratings, comments, and the option to subscribe to the channels of a user's favorite video creators. Revver took a different approach to video hosting and sharing. While other sites let users post videos for free and did not pay content creators any of the advertising revenue their videos generated, Revver shared revenue. It shut down in 2011.

The mid-2000s witnessed the advent of social news and bookmarking sites. Bookmarking is the method by which Internet users organize, store, manage, and search for bookmarks of news and resources online. Delicious, or Del.icio.us, was founded in 2003; it popularized the terms *social bookmarking* and *tagging*. Tagging enables users to organize their bookmarks in flexible ways and develop shared vocabularies. Digg was founded in 2004; its users share links to anything online, and other users can vote the content up or down (or dig or bury). The Digg Effect—when content makes it to the front page, thereby sending a huge influx of traffic to that site, overloading its servers—is a well-known phenomenon today and is often frustrating to those unprepared for sudden popularity.

Real-time Web is a set of technologies and practices that enable users to receive information in real time, as soon as it is published by its authors, rather than requiring that they or their software check a source periodically for updates. There is no knowing when, or if, a response will be received. The information transmitted is often short messages, status updates, news alerts, or links to longer documents. Some significant names associated in this category are Twitter, Posterous, and Tumblr.

With the advent of Twitter in 2006, status updates became the new norm in social networking. Twitter has developed a cult-like following and has a number of celebrity users. Twitter has also spawned a number of third-party sites and

The microblogging site Twitter, founded in 2006, takes advantage of real-time Web technologies that have spread rapidly with the advent of the iPhone. The site had an estimated 500 million accounts and 200 million regular users as of 2013.

applications, turning it into more of a platform than a single service. Posterous is the newest major microblogging application, started by Y Combinator in May 2009. The content of a microblog is typically smaller in both actual and aggregate file size than a blog.

Tumblr, founded in 2007, is a cross between a livestreaming application and a microblogging platform. There are mobile applications available for posting on Tumblr, making it ideal for livestreaming. In fact, the iPhone can be largely credited for the rise in popularity of real-time updates. There are social networks only available on the iPhone, such as iRovr, launched in 2007.

In the context of social media, livestreaming emphasizes the vast flows of personal information and exchange created by social network services. Lifecasting is a continual broadcast of events in a person's life through digital media. Real-time

updates have led to an increase in the number of people who are now livestreaming or lifecasting virtually everything they do, while some opt to livestream by aggregating their online activities in a single place. The Web site Ustream.tv, founded in 2006, allows users to broadcast from the Web site once logged in or from a mobile device using Ustream's mobile broadcasting application. Users can watch streams live on the Web site and on the Ustream iPhone and Android applications. It allows users to interact, such as vote in polls, rate, and chat. Justin.tv is a streaming video host, founded in October 2006, that lets lifecasters and live show creators broadcast to numerous Internet users. FriendFeed, launched in 2007 and recently purchased by Facebook, allows integration of most of one's online activities—Twitter, RSS feeds, Flickr—in one place.

Conclusion

This evolutionary account shows that social media has traveled far from its humble beginnings and intersects with nearly every aspect of people's lives today. It has transformed human communication, human interaction, and the human social experience.

E-Voter Institute

The E-Voter Institute, founded in 1999, is a non-partisan organization focused on helping political campaigns and advocacy organizations integrate online tools into broader campaign strategies. The institute conducts original research on voters and political consultants, develops resources for campaigns and organizations on the most effective use of online technologies, and publishes materials on the convergence of politics and the Internet. Through its Digital Politics Radio, campaign-guidance resources, research, and publications, the E-Voter Institute strives to help campaigns and organizations effectively reach constituents through digital technologies.

Digital Politics Radio

Launched in 2007, Digital Politics Radio is a weekly Web radio show that discusses current and emerging trends related to politics and technology. The weekly show connects listeners with research trends, companies, Web sites, constituent survey methods, products, and much more that can potentially benefit political and organizational campaigns. Guests of the show have included campaign strategists, policy and political trend researchers, media and political directors, geospatial analysts, advertising specialists, mobile app and social media experts, and even stress-management specialists. Weekly shows focus on issues that resonate with campaigns, such as how to best target online advertising, how to increase the value of social media activities, how to develop

and implement cross-media campaign strategies, the expanding role of mobile devices, and how voter behaviors are changing. Listeners can subscribe to weekly podcasts (digital media downloaded through Web syndication or streamed through a computer or mobile device) and easily connect to relevant topics through popular category tabs on the E-Voter Institute Web site. Digital Politics Radio brings a wide range of voices into the conversation about politics and technology, provides campaigns with cost-effective ways to allocate resources, and helps to level the playing field for smaller campaigns and organizations.

E-Voter Research

The E-Voter Institute conducts independent research and publicizes research conducted by other organizations. Annually, the institute produces a Survey of Voter Expectations. Data generated from this survey help to inform campaigns of voters' changing attitudes and of the nature of potential voters' online activities and behaviors. Key topics that are discussed through this research initiative include how the Internet has changed voter behaviors, where potential voters most likely get their news, how campaigns can get and retain voters' attention, how to talk to and with voters, and what trends are influencing voters' decisions. These topics are all geared toward helping campaigns successfully navigate the online environment, reach the most potential constituents, and make the most effective use of campaign resources.

Other research accessible via the institute's Web site includes an array of information from different organizations, Web sites, and advocacy groups. While the themes of available information vary, the central goal of the publicized research is to give candidates, campaigns, and organizations a thorough understanding of the digital political environment, the online options available to them, and also the legalities of navigating online politics. The institute provides a wide range of research on important campaign topics, such as the use of political humor to attract voters, micro-targeting voters, online fund-raising tips and tactics, and strategies for empowering and engaging voters through online technologies.

Some of the most salient topics on the institute's Web site discuss strategies for using mobile

apps and social media in campaigns. Critical information is provided about using mobile apps to recruit and organize volunteers, developing sharable content, creating viral success with YouTube, using online ads to drive traffic, and methods for reaching a critical audience mass. Other prominent topics involve strategies for campaigns to engage in community building and citizen empowerment. This research includes information on maintaining a prominent Web presence, promoting electorate advocacy, and using social media to not only engage voters but also to form transpartisan coalitions and voting blocs to influence agendas across party lines and geography. Other topics include information on the Federal Election Commission (FEC) rules for online ads, background on super political action committees (PACs), and regulations for accepting campaign contributions through mobile apps.

Conclusion

The E-Voter Institute focuses on providing political campaigns and organizations with information they need to be competitive in a developing and evolving online environment. Through creating resources, publicizing research, and hosting Digital Politics Radio, the E-Voter Institute provides candidates, campaigns, and organizations with the tools necessary to be competitive in digital politics.

Facebook

Facebook is the most popular social network in the world, ranked as the second-most visited Web site on Alexa.com (behind Google.com) and registering more than 1.11 billion users as of March 2013. Facebook was launched by Mark Zuckerberg and a group of fellow Harvard University students in February 2004. The founding of the company was dramatized in the 2010 Columbia Pictures movie *The Social Network*; however, the film's story is not completely accurate.

Facebook is designed to facilitate online communities and reinforce social ties. Facebook's functionality is driven by personal profiles, which include a user's real name, employer, and other identifying information. Studies show that users of Facebook and other social networks tend to congregate with individuals who share their tastes, values, and demographics, a characteristic that is sometimes referred to as homophily, which may limit opportunities for citizens to be exposed to competing ideas. However, several scholars have found that social media users may be compelled to be honest in their online self-representations because their online identities are tied to their real-world identities. Others have found fewer incidents of flaming, or ad-hominem attacks, within Facebook discussions when compared to other online forums.

Facebook first became involved in U.S. politics during the 2006 election, the same year that *Time* magazine named "You" Person of the Year, in acknowledgement of the emergence of personalized media. Conventional wisdom holds that Barack Obama used Facebook to significant advantage in the 2008 election, although the evidence is not complete. By 2012, Facebook was a factor in every political campaign. Facebook has also played a part in politics in other countries, and is often credited with contributing to the success of the Arab Spring uprisings in 2011.

Background

Facebook's membership was initially limited to Harvard students, but soon expanded to other colleges in the Boston area, the Ivy League, and Stanford University. It gradually accepted students at other universities before opening to high school students. In September 2006, Facebook became available to anyone aged 13 and older. Facebook is often blocked in countries where the government controls citizen access to information, such as the People's Republic of China. However, the Chinese social network Renren (meaning "everyone"), founded in 2005, offers similar functionality, and is popular with Chinese college students.

Personal profiling of real-life individual users is at the heart of the Facebook concept and its

ongoing success, although this has also led to the emergence of many serious privacy concerns about Facebook usage. Fake profiles are forbidden by Facebook's terms of use. The real-name aspect of Facebook has helped drive the popularity of Facebook Connect, an application that lets Facebook users log onto third-party Web sites with their Facebook identities. Nick Bilton estimates that 9 million Web and mobile services use Facebook Connect. As of October 2012, more than half of Facebook's users accessed the site from mobile phones. Although technological convergence with cellular telephony and with other social media significantly enhances Facebook's political clout by extending its reach in political discourse, it has also raised serious questions about the degree to which user identities may be increasingly trackable through these social media, which in turn raises concerns about dwindling personal privacy.

On May 18, 2012, Facebook launched an initial public offering (IPO) on the NASDAQ Stock Exchange (with the symbol FB) at an opening price of \$38 per share. Uncertainty about the company's future, particularly about the future of advertising on Facebook, initially dogged the stock price, which fell below \$20 during October 2012. General Motors pulled its \$10 million Facebook advertising budget just days before the IPO, citing uncertainty about the effectiveness of Facebook ads.

Role in Politics

During the 2006 U.S. midterm elections, Facebook gave all U.S. national political candidates Facebook pages that the candidates could use to reach potential voters. Most campaigns, uncomfortable with ceding control of their campaign messages to the Facebook audience, used Facebook for one-way communication with voters. However, some campaigns embraced the challenge, and saw Facebook as a way to engage younger voters. Facebook also initiated a program called Election Pulse, where users could see how popular candidates were with other members of the Facebook audience. Election Pulse evolved into the Facebook Politics App during the 2008 election and the U.S. Politics Page beginning in 2009.

Pew research estimates that 10 percent of Americans used Facebook for political communication

during the 2008 U.S. presidential election, which has been called the first Facebook election. On January 5, 2008, Facebook cosponsored the Republican and Democratic primary debates with ABC News, and invited Facebook users to submit questions to the candidates. By Election Day 2008, Democratic candidate Barack Obama had 2.8 million Facebook supporters, Republican candidate John McCain had 620,000 supporters, and 5.8 million Facebook users posted status updates indicating that they had voted.

Facebook created the U.S. Politics Page in 2009, where it now offers insights on how to use the site for political campaigns, contains links to reports on social media and politics, and provides information to voters. During the 2010 U.S. midterm elections, Pew research found that Americans who used Facebook were more politically engaged and more likely to vote than the general population. In 2012, Facebook and CNN started measuring Facebook audience discussion of candidates Barack Obama and Mitt Romney, displaying political chatter by region and gender.

By 2012, Facebook was a standard platform for campaign communication, but it was also effective at turning campaign events into Internet memes. A page titled "Binders Full of Women" generated hundreds of thousands of fans just hours after candidate Mitt Romney uttered the phrase during the second presidential debate. His stance on women's issues was attacked online. Facebook communication was also key in several noncampaign-related political actions. For example, in 2012, Facebook chatter fueled protests against the cancer philanthropy Susan Komen for the Cure Foundation after the organization withdrew funding from Planned Parenthood. The protests led to the resignation of several Komen staffers, and ultimately to the reinstatement of funding.

In 2011, Facebook helped popularize the Occupy Wall Street movement and its many national and international spin offs. Facebook has been an effective tool for grassroots mobilizing of nonpolitical causes as well. For example, more than 500,000 users liked a page called "Betty White to Host SNL (Please)," urging NBC to hire octogenarian actress Betty White to host the popular late-night comedy show *Saturday Night Live* in 2010.

This giant iPhone apps window display in an Apple store in San Francisco in 2009 featured the mobile version of Facebook. By late 2012, over 50 percent of the 1 billion Facebook users worldwide used mobile phones to access the site. Facebook is the most popular social networking site in the world, and has been a factor in U.S. presidential elections and popular uprisings in the Arab world.

Outside the United States

Facebook's impact on international politics is most noted for the role it played in the Arab Spring uprisings of 2011. The Facebook page "We Are All Khaled Said," named in honor of a 28-year-old man from Alexandria who was tortured to death by Egyptian police in front of witnesses, is credited with helping to mobilize forces against the Mubarak regime. Photos of Said's disfigured corpse were distributed to online communities in June 2010. Google employee Wael Ghonim saw the photo and created the Facebook page, which drew a lot of attention within Egypt and from the international community. Internet penetration was still relatively low in Tunisia, Egypt, and other countries where Arab Spring protests took place; therefore, Facebook was used mostly by organizers to coordinate actions within Egypt and to make photos, videos, and up-to-date information available to the international community.

Facebook has been part of political movements in other parts of the world since at least 2008, when a page called "A Million Voices Against

the FARC" catalyzed the largest mass protests in the history of Colombia. In 2009, videos, photos, and textual accounts of clashes between Iranians protesting the outcome of the presidential election and government forces were published on Facebook and Twitter. In 2012, Iceland used Facebook to crowdsource ideas for its constitution. Facebook carried photos, videos, and other reports of the conflict in Syria, which in 2012 was considered one of the most censored countries in the world by the Committee to Protect Journalists. By 2012, politicians and governments all over the world used Facebook to communicate with citizens. Facebook also serves as an alternative news source in parts of the world where official information sources are not always reliable.

Political Communication With Friends

Social networking sites make it easy for people to seek out others with similar tastes and values, potentially increasing the polarization of political discussion. Some research suggests that the Internet may be an "echo chamber" controlled

by mainstream media, commercial interests, and powerful political forces. Political discussion on Facebook increased during the 2012 U.S. presidential election season, and there was much discussion in the popular press about whether it was proper Internet etiquette to post partisan political messages where friends of other persuasions might see them. However, Lee Rainie and Aaron Smith found that individuals who discuss politics with friends on social networks may reconsider their opinions when they encounter someone who shares most of their values, but disagrees with them on some issues, suggesting that social media like Facebook may be useful for finding common ground on contentious political issues.

Facial Recognition Technology

The uniqueness of the self, both physically and metaphysically, identifies only one specific person or thing. Biometrics, the automated method of recognizing an individual based on measurable biological and behavioral characteristics, is used to distinguish one person from another based on the unique features of each individual. Facial recognition is the identification of a person by scanning his or her face and matching the captured image with a gallery of images stored in a database. It was not until the latter part of the 20th century, when modern automated recognition systems began to be developed, that the face was employed as a key aspect of individual identity. Facial recognition technology developed from its origins as crude police sketches to a sophisticated computer-based face recognition system. Face recognition systems help find missing persons and help safeguard communities by identifying criminals and terrorists who pose a significant threat to the community. They can be used to monitor borders where illegal immigration, drugs, and drug-related crimes proliferate.

Historical Biometrics

Biometric applications have their roots in the 14th century when the Chinese used fingerprints created by ink on parchment as a form of identification. During the 17th and 18th centuries, modern countries developed police sketches as methods of identifying criminals, where artists hired by police agencies would sketch the likenesses of criminals using a witness' description of the individual. In the 1800s, India started using fingerprints as official seals on documents, and policing agencies in modern countries around the world developed a "top most wanted list" that posted police sketches, and later, photographs of wanted criminals and missing persons.

The first semi-automated system for face recognition was developed in the 1960s. This system required an operator to locate the facial features on a captured image of an individual, such as the eyes, ears, nose, and mouth. After putting this data into a computer system, distances and ratios were calculated between the facial features,

and the findings were matched to a database of recorded facial ratio data. The uniqueness of the individual was evident in the distances between facial features; that is, no two persons had the same ratios. These automated systems allowed a facial image to be measured by 16 distinct features: the eyebrow and chin vertices, the tip of the nose and the eye, the lip corners, and the upper and lower middle points. These facial points and features, and the distances in relation to each other, could be translated into an algorithmic data set and then used to identify the individual.

In the 1970s, this earlier system was modified by adding extra distinct markers of the face, such as hair and eye color, and even lip thickness to more accurately identify an individual. In 1988, facial features were coded into broken down structures called “eigenfaces.” The eigenfaces were then stored in a one-dimensional format, where the image was compared against a gallery of database images, using the distance ratios between the facial features. The disadvantage of this system is that it requires a full frontal face image to be captured, without which scans are poor and matches with the database may be inconclusive. In 1991, this technology was employed in closed-circuit surveillance cameras, providing data from face images to be collected in real time. Later, these facial features data were broken down into nodal points on the face that the computer used to reconstruct a three-dimensional representation of the image. This meant that partial images of the face captured by cameras did not yield a full frontal image that could still be identified.

Modern Facial Recognition

State-of-the-art face recognition systems developed in the 21st century are currently able to capture real-time faces in streaming video, and then convert the facial images into data templates that are sent to workstations where a facial matching assessment is conducted. From workstations, alerts are made communicating the identification of an individual if a match exists, and nonmatching images are discarded from the system.

Although state-of-the-art face recognition systems have overcome the problems associated with attaining effective face scanning in earlier systems, a face match does not indicate a 100 percent correct identification because there are many factors

that affect face identification. For example, if the target person wears eyeglasses, this can reduce the accuracy of identification. Similarly, the accuracy of identification is affected by lighting conditions, the angle of the face pictured, the facial expression of the persons, the camera position, and the motion of a person’s face and head. The size of the database also affects the identification rate. A test conducted by the National Institute of Standards and Technology (NIST) in 2006, for example, found that while the test for the best face recognition system returned an 85 percent identification rate among the image gallery of 800 people, it returned a correct rate for 83 percent of 1,600 people images, and a rate of 73 percent for about 37,000 images.

Facial recognition has been an important tool to combat and deter crime by identifying humans at a distance. For example, facial recognition was a major component of the Human Identification at a Distance research program of the Pentagon’s Defense Advanced Research Projects Agency (DARPA), put into place in 2000 and tested at the 2001 Super Bowl in Tampa, Florida. Using the facial recognition system of Viisage Company, Tampa law enforcement officers scanned nearly 100,000 spectators’ faces at the Super Bowl to locate criminals. The facial recognition system compared the scanned face images with the photos of criminals uploaded to the system by law enforcement officers, and detected the presence of 19 criminals among the crowd.

Facial recognition systems can be useful for law enforcement agencies in their fight against crime; however, there are some ethical concerns about their use in public places. Philip E. Agre discusses ethical questions concerning the use of facial recognition systems in public places. Agre believes that the use of facial recognition systems in public places should be outlawed because they can be too intrusive into people’s private lives and can to violate basic rights of privacy. Opponents of this thought, on the other hand, claim that the use of surveillance cameras does not violate privacy because there is no expectation of privacy in public places. Another ethical concern is the accuracy of face recognition systems and their tendency to make false identifications.

A study conducted by the National Institute of Standards and Technology in 2000 found that

A U.S. soldier in Logar Province, Afghanistan, uses a biometric device called handheld interagency identity detection equipment, or HIIDE, to record information for a local man on May 9, 2011, to be added to a facial recognition system. Facial recognition systems are improving, but are still subject to significant error. A 2006 review found that while the best facial recognition system returned an 85 percent identification rate for an image gallery of 800 people, this fell to 73 percent in a larger pool of 37,000 images.

facial recognition systems tested a 43 percent false rejection rate for images of the same person taken one and a half years apart. In July 2001, in Tampa, Florida, a hidden government surveillance camera equipped with a face recognition system captured the facial image of construction worker Rob Milliron. Milliron's image was then misidentified for a criminal with child neglect charges from Oklahoma. Milliron was arrested, but was released soon after it was learned of the misidentification.

Face recognition systems are still an effective law-enforcement tool, despite their flaws in accuracy of identification. It is still a very new technology that is being developed, and researchers are constantly trying to optimize its efficiency in accurately identifying people. In the future, face recognition systems may be perfected and become more functional. They may help find missing persons, track down fugitives,

and secure national borders. Face recognition systems could provide a more convenient and safe world in the future.

FactCheck.org

FactCheck.org, a nonpartisan project of the Annenberg Public Policy Center of the University of Pennsylvania, describes itself as a nonprofit "consumer advocate" with the goal of monitoring factual accuracy in U.S. politics. The Web site, which combines journalistic and academic elements, points out confusing or deceptive messages in order to increase public understanding, and then presents evidence contradicting the misinformation. Philanthropist Walter Annenberg provided an endowment that established the Annenberg Public Policy Center (APPC) in 1993; his aim was to create space for a scholarly, academic community that would focus on public policy issues at federal, state, and local levels.

FactCheck.org does not employ an evaluative rating system, as do PolitiFact and other political fact-checking sites. Instead, an article presents a misleading or deceptive statement or story, and then rectifies it. This is done by pointing out the false information, partial evidence, or misrepresentation, and then providing the full original statement or accurate evidence. For instance, in the 2012 election, a political action committee (PAC) presented a radio ad featuring a statement from Republican Mitt Romney. However, the statement was taken out of context and did not include the entire statement, which cast a totally different perspective than the radio spot suggested. In another example, Wayne LaPierre,

National Rifle Association CEO, incorrectly claimed that President Obama had flip-flopped on his position toward guns. According to LaPierre, Obama's campaign promise was to not take away anyone's guns, but once elected, he changed to supporting an assault weapons ban. FactCheck pointed out that the president is not attempting to take away anyone's existing guns, and he has consistently supported a reinstatement of the assault weapons ban that President Bush allowed to expire.

The homepage features a rotating picture gallery and the organization's newest stories. In addition, videos are embedded in the articles, and content is available through an RSS feed. The "FactCheck" mailbag presents readers' comments, and a feature called "Ask FactCheck" allows audience queries for quick answers to recent rumors or misstatements. The "Viral Spiral" section features endless viral rumors that are the subject of extensive repetition; readers are given a summary of the facts and links to full articles. The Web site also offers readers the opportunity to browse archived stories by month, tag (topic), or section. The latter includes a variety of divisions that represent the organization's different elements, including party lines (misleading talking points offered by political parties) and spin detector spotlights.

Director Emeritus Brooks Jackson established FactCheck.org in December 2003 after joining the APPC. A journalist who had covered national politics for three decades for the Associated Press, *Wall Street Journal*, and CNN, Jackson has won several national awards. While at CNN, he created both the adwatch and factcheck genres, reports that deconstruct false or misleading political statements. The current director, Eugene Kiely, is a government and political journalist who has held posts at *USA Today*, the *Philadelphia Inquirer*, and the *Record* (Hackensack, New Jersey). Managing Editor Lori Robertson, a journalist, editor, and writer for media watchdog *American Journalism Review*, joined FactCheck.org in 2007. Dr. Kathleen Jamieson, Elizabeth Ware Packard professor at the Annenberg School for Communication at the University of Pennsylvania and director of the APPC, is a highly regarded scholar in the area of political communication, particularly on the press, politics, and campaigns. Her pioneering research into deceptive political

TV advertisements serves as the basis of adwatch segments. Writers, researchers, and Web designers are also identified on the Web site.

Until 2010, FactCheck.org was financially supported by APPC funds, money from the Annenberg Foundation, and grants from the Flora Family Foundation. A change in 2010 allowed donations from individuals and instituted its first public appeal. In order to dispel any public concerns over influence, FactCheck.org began to publish its finances in detail, including identifying those who give \$1,000 or more. They do not accept financial or other support from unions, partisan or advocacy groups, or corporations.

FactCheck.org is the recipient of a number of Webby Awards (known as the Internet Oscars), presented by the International Academy of Digital Arts and Sciences, which honor Internet excellence. From 2007 to 2010 and 2012 to 2013, it received the most public votes, garnering the Webby People's Voice Prize in the politics category. *Time* magazine named FactCheck one of its "25 Sites We Can't Live Without" in 2006, lauding it for its mission of picking apart speeches, press releases, TV ads, and other public statements by politicians to set the record straight. *PC Magazine* called it one of the "20 Best Political Web-sites" in 2008, noting that the media and the Web do not always provide the most accurate information. The article congratulated the extensive research team's efforts to squash political rumors and debunk myths. In particular, FactCheck was praised for answering reader questions on current policy and political issues.

In addition, FactCheck won a 2009 Clarion Award for its 2008 presidential election coverage. FactCheck.org also won a 2010 Sigma Delta Chi Award from the Society of Professional Journalists for its coverage of deceptive claims made about health care legislation.

Faith-Based Social Change

Charles Taylor has argued that the West lives in a "secular age." Yet, as Taylor also points out, this very claim—celebrated and lamented more than ever before—is ambiguous and often misleading. It leaves out much of the story. On the one hand, it is said that religion in the West has lost its power to counter the epistemic authority of modern science and the moral skepticism of the Enlightenment. From this angle, religion (seen as the relic of an undeveloped and naïve past) and new media technology (seen as the material and political counterpart of late, liberal capitalism) come to seem antithetical. Whereas religion finds itself tied to the past, new media find themselves synonymous with change, progression, and the brink of modern and advanced thought—especially when viewed through the lens of the digital revolution. Following this perception, religion and technology become ideologically and even morally opposed to one another, binaries that dwell at polar ends of the societal spectrum.

On the other hand, this easy bifurcation proves both historically dubious (religion and media technologies have been working hand-in-glove for centuries) and intellectually limiting when it comes to grasping with complexity the current state of affairs. Heidi Campbell has shown how this simple binary emerges in practice, and how misleading it can be upon closer inspection. For example, when Pope Benedict XVI delivered his 2006 Message to the World, it was reported that he "[condemned] contemporary technology

and [promoted] religion in its place.” Campbell argues not only that was this an incorrect portrayal of the Pope’s message, but—more importantly—she points out that the Catholic Church, among countless other religious organizations, has long encouraged and supported the advancement of communication technologies to spread its message and mission. In other words, contra assumptions that negatively correlate religious belief with technological and societal modernization, religion, and new media have always intersected (and continue to intersect) in varying ways that maintain and change communicative practices embraced by millions. This holds true, especially for the shape, character, and future of the diversification of individual religious practices and forms of expression.

Thus, in light of the extent to which religious followers have come to influence and be influenced by new media, religion has grown into an important and expanding field in the broader study of digital culture. Within this research, *faith-based social change* is a term that seeks to both describe and make visible how changes in religious communicative practices come to interact with trends and changes in the relation of new media and society. Studying the traditional practices of religion in new technologies and media, scholars have started to explore the (re)shaping of religion and spirituality as they emerge in digital culture.

Religion 2.0

Pauline Cheong and Charles Ess characterize faith-based social change as “Religion 2.0,” or “the manifold interactions between, on the one hand, diverse expressions and institutions affiliated with religious traditions and practices around the globe, and, on the other, the equally diverse and rapidly changing affordances and possibilities of Web 2.0.” Religion 2.0 is not merely confined to the notion of religion online, which provides information on Web sites regarding religious histories, theologies, and entities. Rather, it describes the features of something more profound and interesting: online religion, which encompasses how religious practices and rituals function in virtual sanctuaries. Cheong and Ess show how the assimilation of new media into religious spheres of storytelling, faith sharing, and symbolism

facilitates the “spreadability of values,” and ultimately contributes to social change.

Again, this is not a new story. Religion, like any social formation, circulates meaning through forms of intrapersonal, interpersonal, and communal interactivity. The many facets of religion (e.g., lay expression, prayer, ritual, faith, and proselytization) are thus discursive acts that draw upon the available means of communication. Throughout the ages, technological advancement has brought new affordances to the accessibility, production, and consumption of information. Religion has always dealt in the nature and use of information, both adopting and adapting to media technologies that provide increasingly powerful and precise means of communication. As technology progresses, religions adjust to the newest media, discovering new ways for praying, expressing faith, and identifying within a religious community. Not only does religion adopt new technologies, but history also illustrates how intertwined religion is to the journey of communicative innovation. The invention of the printing press, for example, made possible the circulation and greater translation of ancient texts, marking the move from a Church-governed education to secular-based institutions. It also enabled readers the chance to study the Bible individually and sidestep religious authority. The trend toward more independent thinking led to the Reformation. During the Reformation, religion thrived, adjusting to the new technologies, providing new means for people to participate in spirituality. With each new technology, religion maintained its presence in society, adapting and influenced by new forms of communication. Radio, television, the Internet, and digital media have each provided means for useful and powerful modes of spiritual expression and experience.

For example, Cheong has examined blogging, microblogging, and associated channels of user-generated content and social networking sites (SNS) to understand the perceptions and practices of modern modes of worship. She shows how some view the Internet as a sacred space, suitable for “information seeking, worship, and interaction with other believers.” Blogging and microblogging allow individuals to express their interpretations of the Bible, and provide ministers a means to present doctrinal critiques of other

credos to the public, patterns that are consistent in the Protestant Reformation. Some bloggers revealed that they write as a form of documenting personal spiritual journeys and religious experiences. Others wish to share their faith, and feel a sense of duty to inspire others and give dialogue to current political and religious issues.

Thus, while social media supports a trend toward religious individuality, this movement, as with the Reformation, is not uniform. For example, social media enable the formation of communities of what might otherwise be disparate, if like-minded individuals. Cheong found, in one instance, that among those who have taken to the Web to practice direct scriptural interpretation are conservative Catholics. Because of the continued instantiations in the public sphere of scandals connected to the Catholic Church, Cheong found adherents entering into online conversations and producing an alternative site for advocacy in seeking change in the Church.

Social Media and the Religious Experience

Community and lay expression are an integral part of religion, and social media have also served to extend and modify these facets of religious practice. Twitter, for example, is an apt form of social media in which religious microbloggers are able to share faith-related content in a concise and quick manner. While the act of blogging becomes a religious practice of finding spiritual and sacred meaning in life experiences, tweeting is a real-time form of ritual that can be understood and lived as a religious experience. As users link to religious and nonreligious blogs, official online church sites, secular resources, and other sites of faith-based conversations and information, networks among bloggers and microbloggers establish identity, authority, community, and meaning, consequently fashioning a religious digital culture.

The (re)circulation of faith-based mini-narratives and messages has thus added to the development of an online religious “participatory culture,” where believers prompt others to express their faith and assess such expressions by way of responding to, recirculating, or reconstructing the message. For example, the Twitter of Faith Challenge was created in 2008 by Minister Adam

Walker Cleaveland after he virtually expressed his faith in a condensed statement of 140 characters on Twitter. He then encouraged his Twitter followers to do the same, asking them to write their own “Twitter of Faith” in 140 characters with the accompanying hashtag “#TOF.” This meme quickly spread as Twitter users or “tweeps” responded to the call, providing condensations of theological truths or biblical passages. Tweeps were further encouraged to share the experiment on blogs or Facebook to continue the pattern of expressing faith.

Various Christian organizations now use digital media to imitate traditional patterns of worship and follow scriptural admonitions in new and innovative ways. Prayer chains—the Pentecostal practice of unified congregational praying focused toward particular persons or topics—have made their way into Twitter feeds. Church clergy and members submit prayer requests and recommendations that appear on prayer feeds, and written prayers can be seen on a tweetgrid, enabling users to “pray without ceasing” and “reinvent the century-old practice of praying set prayers from the Bible, hymns, and devotionals.” Some churches have sanctuary screens that display congregants’ live tweets, allowing members to virtually participate during sermons.

As technologies continue to advance, the ways in which individuals and groups express their faith, form communities, and engage in religious rituals will expand. Given the continual movement of individualization that most noticeably began in the Reformation, it would be expedient for scholars to continue exploring the tension and relationship between religious authority and autonomy in light of new technologies. Simultaneously, the inclination to form communities online is an important area that requires further investigation, particularly as religious and nonreligious persons make sense of spirituality across political and cultural dimensions of society. Furthermore, the perception and trends of secularism and religiosity continue to raise questions regarding debates about the separation of church and state.

Fan Page

Fan pages are Internet pages that are meant to represent a person or a group of persons, a company, a political party, a nongovernmental organization (NGO), or any other form of intellectual entity, and are aimed at uniting fans or followers of that entity. Such pages are mostly utilized on well-known and widely used social media platforms, such as Facebook and Twitter, where they have become popular for both fans and marketers. The use of fan pages in relation to politics, both in official and unofficial manners, has grown exponentially within the past few years.

There are two different types of fan pages: those made on behalf of the physical or intellectual entity represented, and those made by the person or entity's fans.

Fan pages offer a variety of exclusive material on their subjects, such as photographs, accounts of recent events, notices of upcoming events, opportunities to get discounts for related products, and specifically for political or charitable use, instructions on how to become involved and help. Furthermore, unofficial fan pages can often offer a wide range of creations made by fans,

such as drawings or music videos. Other activities such as fan fiction, cosplays, or video games can also occur but very rarely in relation to a political figure.

Antifan pages also exist to unite people through their hatred of a particular entity, often through the use of derision and criticism. Many comparable pages were, for instance, created by fans during the French and American presidential campaigns of 2012 in the hope of discrediting the adversary and convincing followers of these pages—as well as random viewers—to vote for the other candidate.

Here, the decision to create or follow a page either for or against a particular political figure can be seen as the strong and visible expression of a political belief and an identity choice made by the fans. The act of creating a fan page, however, goes beyond passively following an idea, and is an illustration of the level of conviction and commitment among individuals sharing the same set of values.

Besides offering the possibility to easily communicate with a vast number of people interested in the subject—and content—of the page, such profiles have a second function. The mere presence of numerous followers on a Twitter fan page or of many likes on Facebook vouches for the generated interest in—and, in case of a political use, the agreement with the values of—the person, entity, or symbolic attribute represented by the fan page. This public and instantaneous grading scale is therefore used to measure the collective infatuation for a given person: The higher it is, the more observers (whether they be, in this case, political commentators, political activists, or just members of the population) will believe that the views and persona of the individual portrayed in the fan page are supported by the people.

Furthermore, information such as fan page metrics (available on Facebook, but not on Twitter, for instance), including the location of the followers or their demographic splits, may also allow political parties or campaign managers to have an idea of who and where their followers are. Fan pages organized and maintained by fans, however, will not provide access to this specific information to official institutions, but still demonstrate a certain level of interest in the subject.

Finally, one must be aware of the limits of fan pages. More and more marketers are realizing the discrepancy between liking or following a page and the actual level of interest or involvement that fans may have, who may well be fans of the page without actually intending to become active supporters or even to vote for the person.

Fax Machines and Tiananmen Square Crisis

The 1989 demonstrations for democracy in China took place in all 29 Chinese provinces and in 84 cities. In excess of 2 million students participated in these events and they represented more than 600 educational institutions across the country. Students from more than 80 distinct higher learning centers gathered in Beijing's Tiananmen Square to demonstrate. Not only college students demonstrated in Beijing: Citizens representing in excess of 700 separate organizations participated. Among the protestors were people from nontraditional adult learning centers and more than 100

trade schools and universities. Even high schools, middle schools, and grammar schools were represented in the demonstrations as their faculty chose to support the demonstrations. Employees of more than 100 government agencies participated, as did workers from hospitals, factories, and retail businesses. In fact, approximately 15 percent of all Ministry of Culture personnel demonstrated.

By May 4, 1989, estimates of the numbers of student demonstrators were as high as 100,000. Approximately 80,000 students converged on Tiananmen Square for Mikhail Gorbachev's May 15 visit. By the following day, the mass of demonstrators in the heart of Beijing grew to 300,000; and in the two days that followed, the square teemed with more than 1 million students.

Communications

By summer 1989, China's telecommunications system had advanced just enough to include the fax machine as a new technology. During and after the Tiananmen Square crisis, the Chinese government blacked out most means of communications and forbade all foreign news coverage. The government halted satellite transmissions and arrested noncompliant journalists. However, throughout these events, the fax as a new mode of communication was overlooked. Journalists evaded the ban as they transmitted their accounts using early mobile telephones, but these were not common.

Students and others in the prodemocracy camp maintained open lines of communication for news with fax machines and e-mail. In a strange reversal of information flow, Chinese citizens were dependent on daily reports from Western news sources. Photographs and reports of events unfolding in China were faxed from outside China back to businesses, government offices, hospitals, and schools in Chinese cities as part of an opposing viewpoint countering the local reports disseminated by the Chinese government.

As the crisis deepened, blind faxes to strangers were sent around the clock, particularly directed at hotels and businesses inside China. Private businesses like copy shops ran their faxes incessantly, sending news to anyone who could receive faxes. The hope was that information would leak out to the rest of the world through whatever channels

Passersby read a wall of protest posters outside of Tiananmen Square in Beijing, China, on June 2, 1989. News information transmitted by fax machines often appeared on posters like these.

proved to be available and willing. University of Michigan students faxed American and other Western news accounts to Chinese schools, hospitals, universities, and even government offices. It was in large part through the use of fax machines that protestors in Beijing knew that the world was watching and supporting them.

After the massacre, the Chinese government opened 15 controlled telephone lines specifically for members of the public to inform on student protestors and other leaders of the demonstrations who had survived the violence and had gone into hiding. Chinese citizens studying in America sought to foil this plan by flooding the informant lines with calls; the numbers of the lines were passed all over the world via computer and fax machines.

Fax machines also became one of the only remaining conduits for news between China and the rest of the world. Press stories from American sources, Chinese-language sources in particular, were transmitted via fax machine to citizens in China, while handwritten accounts of the events were faxed out globally. Faxed photographs played an especially important role within China given the problem of illiteracy, and multitudes of copies of these faxed photographs were made and distributed in the country. Posters papered walls throughout Chinese urban areas, and most of these were originally faxed.

Impact

The impact of this development was felt all over the world. At a 1991 conference in Prague sponsored by the American Foreign Policy Council, attendees from then Soviet republics received a “democracy kit” with great enthusiasm. This kit was a package comprising, among other things, a reproduction of the U.S. Constitution and a fax machine, which at that time was only recently affordable. Activists in the rest of the world had watched Chinese activists use fax machines during the Tiananmen Square events in 1989 to fight control by the Chinese government and distribute their accounts of the events to journalists abroad. This new technology was filled with potential for social movements and played a role in other movements in the years immediately after the Tiananmen crises because in large part of the example set in Beijing.

Feb 17 voices

Considered one of the few windows into what was happening in many places in Libya during the Internet shutdown, Feb 17 voices is a social network experience to face information censorship via Twitter and an innovative experience in social media. The initiative followed a precedent called January 25 Voices, created by UCLA post-graduate student John Scott-Railton. As a result of the shutdown of the Internet accomplished by the Egyptian government on January 27, 2011, Scott-Railton built this project to tweet the information that he and his team received through a number of telephone calls. The uprising of the Egyptian revolution, two days before the start of January 25 Voices, was covered thanks to the witnesses who shared their experiences by telephone and published them on Twitter and in real time. The action kept up a steady flow of tweeted updates from the ground, as well as updates on what was appearing in Arabic-language print and TV news.

The same principle was applied by Scott-Railton to create the feed Feb 17 voices. This time, the account on Twitter was aimed to give voice to Libyans and Libyan diaspora after the events occurred. On this date, called the Day of Rage, the uprising and civil war in Libya started. Inspired by the Arab Spring, impelled by social movements of the Egyptian and Tunisian revolutions, the National Conference for the Libyan Opposition made an appeal to all the opponents of the Muammar Gaddafi regime to take part in a demonstration. February 17 was the date of the commemoration of marches for democracy in Benghazi five years earlier. Protesters took the streets throughout the country in cities like Ajdabiya, Benghazi, Bayda, Derna, and Zintan.

Previously, in 2008, the Gaddafi government shut down the Internet in Libya through Eagle, a software program created by an affiliate company of Groupe Bull that allowed control of access to the Internet in the entire country. In 2010, this technology was improved, and access to media by telephone was forbidden under threat of arrest. John Scott-Railton decided to launch Feb 17 voices, adapted to Libyan circumstances, with the help of two Libyan American collaborators: Sarah Adurrahman, producer in the National Public Radio *On the Media*; and her husband Abdulla

Darrat, a project manager and activist. The feed quickly received support from the HOPE Libyan Relief Fund, an American nonprofit humanitarian organization devoted to easing the hardships of the disadvantaged, displaced, and unfortunate people of different parts of the world.

After considering that tweets did not give a full explanation of context and lost the truthfulness and strength of the voices, John Scott-Railton began posting audio of calls to the application, sharing audio files via TwiTurm. Within a week, the audio had been listened to more than four million times, which crashed the servers several times. Moreover, the project tweeted messages and posted audio files through the application AudioBoo, making it possible to listen to the telephone calls and other witnesses' documents. Posts were in English and Arabic, or in Arabic

A protestor in a crowd of Libyan Americans takes a shoe to a poster of Gaddafi in Washington, D.C., on February 19, 2011, two days after protests began in Libya to mark the five-year anniversary of suppressed democracy marches in Benghazi.

with English voiceovers provided by Darrat and Abdurrahman. Other contributors helped to contact Libyan citizens by phone to obtain first-hand evidence of what they were living through, along with inspiring stories of desperation, commitment, and courage.

Even the zones of coverage of the media were reached, as the project progressed and the tweets and call files started to expand. A number of records were also translated and later tweeted by volunteers and observers that followed the coverage of Libya events offered by Al Jazeera Arabic and Al Arabiya. All of this information was translated and tweeted to help provide context to non-Arabic speakers. As soon as the media concentrated their information on the actions that took place in Benghazi, Feb 17 voices paid attention to Western zones that were still affected by serious conflicts. This nonstop coverage provided daily updates and audio calls from Jebel Nafusa, the Western Mountains, with some witnesses in Amazigh, the Siege of Misrata, the Battle for Tripoli and the final Siege of Sirte.

As the media explained how protesters torched a number of civil and government buildings, police stations, and security buildings and sacked public radio and television channels in Tripoli, Feb 17 voices gave voice to particular stories to complete information that did not receive coverage in the news. Some witnesses referred to how Libyan security forces fired live ammunition into the protests, while the media focused on more massive events such as the attack and burning of the Interior Ministry, the People's Hall, and the Revolutionary Committee offices.

The first tweet related to the uprising began on February 18, with the recording of a live phone call. The document gave voice to a woman in Tripoli, before joining the protests in Green Square. On the same day, police and army personnel withdrew from Benghazi after they were overwhelmed by protesters and joined them. Other tweets followed on the same date, explaining the actions of the security forces in Benghazi, who were completely overwhelmed by opposers, lured the protesters in and then fired on them; the violent measures of the regime, using foreign mercenaries to stifle protesters; the camping out of the demonstrators; and the filling up of hospitals with casualties. More audio files

reproduced protesters' chants or gunfights near Gaddafi's residence.

The comments echo other media like the *Guardian*, which published Al-Zahf al-Akdahr, a progovernment military officer, who asked for a violent response to protesters. It also quoted United Kingdom First Secretary of State William Hague's statement as "unacceptable and horrifying." The feed focused extensively on the aerial attack of the coalition forces and the missiles fired by the U.S. Army on March 19, while some witnesses explained how protesters were shot by helicopters and airplane bullets, and a number of doctors were executed by the government. The day after, some witnesses reported before and after that the dictator's son, Saif Gaddafi, spoke about an expected resignation that did not happen.

Feb 17 voices reached nearly 3,700 followers from the beginning of the project to Muammar Gaddafi's death on October 20, 2011, and attracted approximately 10,500 followers. Gaddafi's execution was extensively reported through videos, photos, and maps of his hideout. After the end of the conflict, a few more tweets were sent to the feed, especially to commemorate the events. The content of Feb 17 voices has been widely forwarded to other sources and Web sites and displayed on event-specific live blogs, such as Al Jazeera's Libya Live Blog. It has been uploaded and disseminated via YouTube, sent out of Libya, and provided to news organizations and televisions, some of them streaming the documents live as they were tweeted.

Federal Privacy Act

By the late 1960s and early 1970s, the U.S. government increasingly relied on computer databases to track citizens' activities and transactions. As a result, the Privacy Act of 1974 [Public Law 93-579] was enacted because of the impact of incursions into individuals' right to privacy and free speech. The purpose of the Privacy Act of 1974 is to balance an individual's right to privacy and access to information culled by the government with the government's need to collect, maintain, and use private information.

The principal aim of the act is to safeguard privacy by instituting certain "procedural and substantive rights" in the government's use of personal data. This includes requiring federal agencies to follow particular principles, called "fair information practices," which act as guidelines when gathering and handling individuals' data. The most important of these principles are: (1) requiring federal agencies to reveal to the affected individual any records kept on him or her; (2) restricting how agencies share individuals' data with other entities; and (3) allowing individuals to sue federal agencies for violating the provisions set forth by the act.

In 1965, hearings were held by the U.S. House of Representatives Special Subcommittee on Invasion of Privacy. Congress was concerned with the increasing use of computers to collect and retrieve citizens' personal information, especially the social security number, as an identifier. Also, after the Watergate Affair, Congress determined that there was an urgent need to address illegal surveillance and investigation of individuals by federal officials. Numerous hearings were conducted, and reports were generated on such disparate topics as commercial credit bureaus, national data banks, and the effects of computers on personal privacy. These concerns seeded the formation of the act.

Creation of the Act

A significant influence on wording of the act was a report commissioned by the U.S. Department of Health, Education and Welfare, Records, Computers, and the Rights of Citizens. At the heart of this report were five basic principles called a Code of Fair Information Practices (named after

the Code of Fair Labor Practices). These principles became the foundation of privacy legislation as conceived in the act and in federal, state, and local privacy legislation thereafter. These codes are: (1) there must be no secret personal-data recordkeeping systems; (2) there must be a way for an individual to find out what information about him or her is in a record and how it is used; (3) there must be a way for an individual to prevent information about him or her obtained for one purpose from being used or made available for other purposes without his or her consent; and (4) there must be a way for an individual to correct or amend a record of identifiable information about him or her. After the release of this report, the Secretary's Advisory Committee on Automated Data Systems recommended that Congress enact a Code of Fair Information practice for automated personal data systems.

The act was borne out of compromise between two bills: one from the House of Representatives [HR 16373], and one from the Senate [S 3418]. Differences were significant, and a compromise was devised. This compromise included: the creation of the Privacy Protection Study Commission; a stipulation that certain violations must be deemed willful, arbitrary, or capricious before damages could be assessed; a guarantee that affected individuals be entitled to recovery of at least \$1,000 in damages; the inclusion of the House's "routine use" exception regarding information sharing (where the use of a record for a purpose is compatible with the purpose for which it was collected); and finally, the inclusion of the Senate's provision that an individual can appeal in federal district court a refusal by a government agency to amend a record. The act was passed by the Senate on December 17, 1974, passed by the House on December 18, 1974, and signed and enacted into law on December 31, 1974.

Main Provisions

The act guards against misuse of individuals' records by the executive branch of the U.S. government. This includes cabinet and military departments, corporations controlled by the U.S. government, independent regulatory agencies, other branches or divisions of the executive branch, as well as agencies subject to the Freedom of Information Act. Excluded are records maintained by

state and local governments and those in the possession of privately held organizations. Exemptions from the act's protections are allowed for these agencies: (1) records maintained by the U.S. Census Bureau, the U.S. Bureau of Labor Statistics, and the U.S. Department of Homeland Security's Arrival and Departure Information System; and (2) records kept for routine uses (referring to external sharing of information outside the agency), archival purposes if the record has sufficient historical value, law enforcement purposes, congressional investigations, and other administrative purposes.

Only records that are maintained in a "system of records" fall under the purview of the act. Within the confines of the act, a record is defined as that which contains personally identifiable information about an individual, up to and including information regarding the individual's education, financial dealings, and medical, criminal, or employment histories. A "system of records" includes records where information may be retrieved by name, social security number, or other identifying symbols assigned to an individual. Information not kept in a system of records is not subject to the provisions of the act, and may be accessed under the Freedom of Information Act.

All citizens of the United States may seek to gain access to most personal information maintained on him or her and may seek redress in case of errors in or misuse of such documents. The act allows only aliens lawfully admitted for permanent residence in the United States to seek and receive information regarding the collection, maintenance, utilization, and dissemination of records kept by federal agencies of the U.S. government. Nonresident foreign nationals are not eligible to use the act's provisions, but may use the Freedom of Information Act to request records about themselves.

There are five requirements relevant to most citizens and aliens lawfully admitted for permanent residence in the United States. Each federal agency must establish a set of procedures for allowing individuals to examine their personal records for omissions, timeliness, relevance, and completeness. Individuals must be allowed to copy their personal records and correct any errors. This is the fundamental provision of

the act. In order to prevent the maintenance of "secret record systems" (dossiers) and to promote transparency and good faith among the citizenry, each federal agency must publish notices of all "systems of records" it maintains. These notices must include complete descriptions of personal data recordkeeping policies, practices, and systems. Each federal agency must, to the best of its ability, maintain individuals' records in good order insofar as such records are accurate, relevant, timely, and complete.

Under the act, federal agencies are not permitted to maintain information on citizens' exercise of those rights guaranteed under the First Amendment of the U.S. Constitution, unless that maintenance is specifically by statute, by consent of the individual, or relates to authorized law enforcement activity. Federal agencies must abide by rules set forth in the act for use and disclosure of personal information.

The act specifies that any information culled for one purpose may not be used for another without notice to or consent of the affected individual. Also, disclosure of individuals' personal information must be recorded and maintained by that federal agency. An affected individual may seek through legal remedy enforcements of the rights guaranteed by the act. Also, any employee of federal agencies may be subjected to criminal penalties should they fail to comply with the act's provisions.

Privacy Protection Study Commission

A final provision of the act created the Privacy Protection Study Commission (PPSC), which in 1977 issued the report *Personal Privacy in an Information Society*. This report noted that while the act represented a step forward in addressing the increasing privacy concerns of the U.S. government's use of citizens' data, the positive results intended by Congress did not materialize, in part because of the opaque language of the act, specifically regarding the act's definition of "systems of records." The act's definition of "systems of records" only encompassed databases that retrieved records by name, social security number, or other individually identifiable information. This omits from the provisions of the act any database that does not index by these attributes.

The PPSC also noted that although publication of federal agencies' personal data recordkeeping policies, practices, and systems in the Federal Register was helpful, it is of limited impact because of the citizenry's lack of awareness of such disclosures and the publication of the Federal Register. Also, the PPSC noted that the information disclosed in the Federal Registry lacked detail about how systems are used internally by federal agencies.

The report also noted that, at the time, few individuals had made use of the act's provisions (the only significant court case regarding a citizen claiming protections under any of the provisions of the act occurred in *Doe v. Chao* 540 U.S. 614, in 2004). The report attributed this to a lack of public awareness of the act and to the wideranging exceptions to the act's provisions of large-scale and prominent government agencies like the CIA and law enforcement. Finally, the report iterated that federal agencies were not applying consistent standards for compliance to the act's provisions, and attributed this lack of compliance to misunderstanding of the act's provisions by federal agency personnel.

Federal Shield Law, Bloggers and

The proliferation of online publishing by citizen journalists and bloggers has had a significant impact on the changing nature of journalism and news media, with mainstream media outlets not only encouraging such activities, but actively incorporating information from citizen journalists into their reports. The emergence of Wikileaks and other various legal challenges to journalistic privilege for bloggers has raised questions regarding the feasibility of federal (and in some cases state) shield laws that protect journalists from having to reveal their sources or confidential information in court. The question of whether bloggers and citizen journalists are among the protected groups remains at the forefront of this debate.

The Federal Shield Law (also known as the Free Flow of Information Act) was originally initiated in 1972 by Representatives Charles Whalen Jr. (R-Ohio) and William Moorhead (D-Pennsylvania), following the *Branzburg v. Hayes* case, when the Supreme Court refused to recognize the privilege for journalists not to be compelled to reveal their sources or confidential information in court proceedings. The original proposal sought to protect mass media outlets, their reporters, and freelancers, stating that in order to force a journalist to give up his or her sources or confidential information, the federal government must convince the judge that the information requested was of sufficient importance to outweigh the journalist's need to protect the privacy of his or her sources. Similar to lawyer/client privilege, reporter's privilege attempts to facilitate the free flow of information because compelling reporters to reveal sources or confidential information would make sources reluctant to provide information, thereby compromising the ability of journalists to effectively do their jobs.

Numerous versions of the law have been introduced and rejected over a 40-year period, with the most recent version reintroduced by Representative Mike Pence (R-Indiana) in September 2011 as H.R. 2932, the Free Flow of Information Act of 2011 (also called the Federal Media Shield Bill). The previous versions of the bill passed the

House of Representatives in both 2007 and 2008, only to be rejected by the Senate. The Free Flow of Information Act of 2011 (H.R. 2932) has stalled before the Senate Subcommittee on the Constitution. Although a federal law has yet to be passed, over half of the states have enacted shield laws, although state laws vary widely in their coverage and the definition of covered journalists.

Critics of the shield law maintain that enacting it will reduce the federal government's ability to uphold national security, although the 2011 bill includes special provisions for instances where the information is deemed necessary to maintain national security, to prevent death or injury, or where the information is deemed vital to a criminal or civil case. Other critics suggest that the existing law is too weak, pointing at the problematic definition of covered journalists, which generally only covers those for whom a majority of their income comes from regularly writing and reporting—a definition that excludes many bloggers and other citizen journalists who are not in a position to derive the majority of their livelihood from writing.

As new communication technologies have been incorporated into mass media, state courts have necessarily expanded the original scope of their shield laws; however, many still define privileged groups according to the medium for which they publish. As a result, electronic publishing is covered in some states, but not all. Some legal analysts suggest that when the original intent of the shield law is considered, citizen journalists such as bloggers should have the same right to invoke the reporter's privilege as reporters affiliated with established media outlets. These analysts argue that bloggers disseminate information to the public in much the same way as traditional journalists, and that they would benefit from the same level of protection, provided the information was obtained with the intent of disseminating the information for public benefit and/or knowledge.

Depending upon its focus, blog content may be used as a personal diary and opinion sounding-board, or a news platform. This blurring of intent, function, and purpose is problematic in regard to establishing shield law protection for bloggers because not all bloggers use their blogs solely as a news platform. Furthermore, opponents to shield law protection for bloggers and citizen journalists

suggest that since they do not have to adhere to the same standards of ethical conduct expected of professional journalists, they should not be afforded the same legal protections. However, it has also been argued that bloggers and citizen journalists are under the same threat of defamation and legal threats as professional journalists. Therefore, whether they formally recognize the standards of professional ethical conduct or not, conscientious bloggers will follow general ethical guidelines that require a focus on presenting accurate facts.

Currently, there is no consensus among the states regarding what constitutes a covered journalist, with states defining journalists in a variety of ways, including official affiliation with an established media organization, making a majority of their income from writing and or publishing, and intent (where the information is gathered with the sole purpose of disseminating it to the public).

In 2011, the Oregon District Court ruled that bloggers are not covered by the state's shield laws; yet in 2012, an Illinois court found that according to their state shield law, bloggers were a covered class of journalist. This lack of consensus is not just an issue for citizen journalists and bloggers, but also for established media outlets that encourage and incorporate such journalistic products into their reports. For example, CNN, Fox News, and other news stations regularly solicit video, audio, and other information on breaking news from viewers. Under the existing interpretation of the shield laws, these citizen journalists might not be covered, but the news outlet might be, depending upon the interpretation of state shield laws.

FightTheSmears.com

In response to widespread rumors about his personal and political life during the 2008 election, Barack Obama and his campaign launched FightTheSmears.com to describe and refute several accusations. The Web site was meant to give Obama supporters ways to respond to such criticism and help the news media reject lies about the candidate. Though the Web site was effective in offering a line-by-line refutation of major rumors—with supporting evidence—its overall influence has been questioned by critics. Nevertheless, while FightTheSmears.com was limited to the 2008 campaign, its power to track rumors driven by social media led to the development of similar sites used to manage the president’s image.

From the early days of the 2008 Democratic primary, Barack Obama faced several rumors. In a variation of an e-mail titled “Who Is Barack Obama?” he was accused of being a closeted Muslim who attended a *madrasa* in his youth, which although the literal translation is simply “school,” is now commonly misunderstood as a fundamentalist Muslim educational program that can serve as a training ground for future terrorists. Among other rumors were claims like these: Obama refused to recite the pledge of allegiance; he took his oath of office with a Koran after being elected to the U.S. Senate; he was not a U.S. citizen; and he was a black nationalist sympathetic to communism. Like other candidates, Obama initially ignored the rumors targeting his campaign. His strategy eventually changed after rumors began circulating that a video existed of his wife Michelle ranting about “whitey” during a talk at Trinity United Church of Christ in Chicago. Although the video never surfaced, the claim was widely discussed online and was eventually repeated on radio and television.

In another example of the Obama campaign fighting one of the smears against their candidate in novel ways, this mug featuring an image of President Barack Obama’s birth certificate could be ordered from the 2012 campaign Web site in fall 2011.

The Web site FightTheSmears.com was launched in June 2008 as an Internet-based rumor clearinghouse where the malicious stories about Obama and his family could be identified, traced to their origins, and refuted with evidence. Breaking from the traditional strategy of responding to preposterous lies with silence, the Obama campaign addressed the rumors head on. In so doing, the campaign recognized what political communication scholars like R. Kelly Garrett later confirmed: Rumors circulating through social media tend to have more power and need to be confronted. The novel approach asked users to e-mail the campaign’s responses to popular rumors to their friends and to report any new rumors circulating online. In response to the rumor about Obama’s wife, the site called the claim a lie and cited news articles quoting reputable conservatives who considered the story ludicrous. The

rumor that Obama attended a madrasa was also called a falsehood, and links were provided to a CNN story depicting his school in Indonesia as a regular elementary school. In response to rumors that Obama was not born in the United States, the site provided a PDF copy of his birth certificate.

While effective at providing Obama supporters and the news media appropriate responses to rumors, FightTheSmears.com was also the subject of significant criticism. According to some psychologists, listing rumors and then rebutting them can often lead readers to remember the rumors as true. Thus, naming false accusations can sometimes give such distortions credibility. Other critics complained that the Web site was often short on evidence, unlike the fact-checking portion of Obama's campaign Web site that preceded FightTheSmears.com. Additionally, the site's effectiveness was further questioned because there was little proof that users would actually forward links to those who believed the rumors. Finally, many conservatives complained that Republicans were too quickly blamed for spreading rumors that were actually started by Obama's opponents in the Democratic primary.

FightTheSmears.com ceased to exist after the 2008 campaign, but it evolved into other Web sites used by the Obama administration. In August 2009, the White House launched WhiteHouse.gov/realitycheck to counter rumors about health insurance reform. The site listed and refuted several rumors—ranging from claims that the Affordable Care Act would lead to rationing of health care services to lies about “death panels”—and asked users to forward suspicious e-mails to flag@whitehouse.gov. In September 2011, the president's campaign launched Attack Watch, along with a Twitter hashtag, to debunk misinformation about the administration. Obama supporters were encouraged to submit reports on smears against the president, mostly by fact-checking Republican presidential candidates. By February 2012, the Obama campaign launched a site for Truth Teams to fight misinformation about the president. Linked to Obama's campaign Web site, Truth Teams listed information by issue and allowed groups of fact-checkers to organize in several swing states.

Findability

Though it has existed for years, findability in its common usage today is a concept popularized by Peter Morville in 2005 to refer to how easily a Web user can find online content using a search engine or by navigating within a particular Web site. To be findable means that it is possible and easy to locate online information known to exist in a general place. In its simplest sense, findability concerns how easy it is for people to find what they are looking for online. Far from a simple concept, though, findability calls upon Web designers and information architects to conceptualize and organize Web content in a way that maximizes its ability to be located, reached, and identified by those looking for it either from within or outside the Web site where it is kept. These organizational choices may have political implications because depending upon one's perspective, it is not always desirable to make certain information easy to find.

On today's Web, search engines play a powerful role in directing Web users toward information thought to be most relevant to a user's search. But search engines offer only limited attentiveness to the nuance of what one may be seeking. Peter Morville, for instance, writes that he was partly inspired to think about findability after searching online for information about his daughter's peanut allergy, only to find that search engines

typically directed him toward overtly commercial Web sites or other marketing material selling nut-free products, which was not the information he wanted. Findability is not just a matter of making it easy to find one's way toward certain information; it is also a matter of assuring the relevance of the information toward which one is directed. While search engine optimization techniques offer Web designers a way to increase the likelihood that their Web sites will appear more prominently in a search engine's results, findability goes further still.

For Morville, findability as a tenet of Web design or information architecture is concerned with three primary questions: "(1) Can your users find your Web site? (2) Can your users find their way around your Web site? (3) Can your users find your products and content despite your Web site?" These three questions might respectively be characterized as problems of locating, reaching, and identifying. In other words, ensuring maximal findability means that a Web user can easily locate the Web site where desired information or content exists, that the user can then navigate easily through the Web site to reach the specific place where this information is kept, and that a Web user can easily and accurately identify the pertinent information as such once he or she has located and reached it.

This last entreaty is especially difficult in a Web with organizational signposts structured with semantic cues that usually amount to key words intended to guide search engines toward particular content. Key words, however, do not always capture the complexity of the content that one may wish to find. Moreover, a clumsy presentation of content on a Web site may unintentionally conceal the relevant information contained therein. That is, it sometimes happens that Web users have arrived at the information they are looking for without realizing it. The desired content may be poorly worded, it may be visually messy, or it may be hidden among long paragraphs full of other information not relevant to the user's concerns. Any variety of reasons—esthetic, grammatical, or contextual—might make desired content unidentifiable, even in plain sight. Maximizing findability in part means ensuring that information is identifiable for what it is, once a user has arrived at its door.

Findability is not just practical; it can also be political. The concept's political aspect becomes evident when considering that content providers do not always have a motivation to make their content easy to find. Sometimes, a content provider has a vested interest to deliberately hide information or otherwise make it not readily findable. For instance, disclaimers required by law, for example, about the side effects of medications or the dangers of cigarettes might deter consumers from buying those products, even though the law demands such disclaimers. Similarly, Web designers may find it necessary for a Web site to include some content that is unflattering, dry, uninteresting, or otherwise unappealing. In such instances, Web designers make decisions to privilege the visibility (and the findability) of certain classes of information over others in order to be more rhetorically effective. Though findability concerns the ease of finding content or information, its corollary concerns the opposite drive to make information more difficult to find. Nevertheless, findability is not a finite resource. The networked structure of the Web means that making some content findable does not necessarily make other content less findable. Strategic decisions, however, can operate to emphasize the findability of certain content more than others, and it is these decisions that bring findability into the realm of the political.

Far from limited to virtual environments, findability in its broader sense also refers to the intervention of technology as an apparatus to help any wayfinding experience. For instance, handheld or dashboard global position system (GPS) navigational systems, digital mapping of the real world on smartphones, or through applications like Google Earth all contribute to facilitating the ease of making one's way through the world. The concept of findability aspires to make easier what can sometimes be an exasperating process of sorting through an information-saturated world to find exactly what one wants at any given time.

FinFisher

The increasing pace of globalization and crime requires more effective methods of intervention. Advances in technology offer opportunities for law enforcement agencies to fight crime within national borders. For example, lawful interception is a crucial method used by law enforcement agencies to fight crime. Lawful intervention is the legally sanctioned access of law enforcement agencies of private communications. It provides crucial information regarding what criminal suspects are doing or are planning to do, and is one of the most important tools for law enforcement to fight crime. In some cases, after obtaining a judicial warrant to enter the offices of suspects, law enforcement agencies may have to insert an electronic transmitter called a "bug" into an object belonging to suspects, especially when they are otherwise unable to obtain valuable data about their operations from other sources. In addition, officers often use safe houses or observation cars to receive what is transmitted by these bugs. However, these traditional bugs began to be less functional because of the increased use of computers, smartphones, and tablets. Thus, bugs began to be directly inserted into the devices of suspects or criminals. Intelligence and police officers are currently able to obtain information from electronic devices using software or hardware-based information technology (IT) intrusion bugs to track suspects and criminals.

FinFisher is a UK-based company, a branch of the Gamma Group, which provides IT intrusion solutions for law enforcement agencies. In 2012

and 2013, slivers of information regarding FinFisher products and their unique covert surveillance abilities found their way into several newspaper stories on cyber security, bringing FinFisher technology into limited public view. For example, an analysis conducted by the University of Toronto Munk School of Global Affairs' Citizen Lab regarding five suspicious e-mail attachments obtained by Bloomberg News, which were sent to a Bahraini activist in 2012, exposed the name of FinFisher and its IT intrusion products.

The products that FinFisher provides can be summarized into two groups: those that provide tactical solutions, and those that provide remote intrusion solutions. The term *tactical* refers to the use of equipment by law enforcement officers in the area of operations. In a similar vein, tactical IT intrusion solutions produced by FinFisher are used by law enforcement officers when they are in the vicinity of their targets, or when they have the opportunity for physical access to the IT devices of the targets. *Remote* IT intrusion tools consist of executable codes acting as a Trojan that can covertly access private and personal data of targets and can send them to a remote location by taking remote control of their computers or smartphones. These executable codes are downloaded over the Internet without one's knowledge upon opening an e-mail attachment or text message, or by clicking a link on a Web site. Because they run in the background, they are not noticed by users, unless they are detected by an antivirus program; however, these types of professional codes can bypass many trusted antivirus programs.

These remote IT intrusion tools can secretly record all the text written by the users of a computer or a mobile device as they are striking the keys of the keyboard, and can later send the recorded keystroke history data to a remote location. Furthermore, these tools can access private data sections on the computers and mobile devices of the targets and transmit their private information, documents, and files to a remote location. In addition to taking remote control of the computers, these devices can also provide a means for turning on Web cams and microphones of the computers from a remote location to monitor what the user is doing. Moreover, the smartphone version of the IT intrusion tool can record voice calls and texts, and can track the geographical

location of the targets through built-in global positioning systems (GPS).

Citizen Lab has found a FinSpy malware communicating with a FinSpy command and control server in Ethiopia. According to Citizen Lab's findings, when the FinSpy malware is activated, it creates a JPG picture of members of the Ethiopian opposition group, Ginbot 7, with the same file name as the malware. Therefore, victims believe that the opened file is just a picture, not a malicious code. Furthermore, Citizen Lab has detected the presence of FinSpy Mobile for Android malware in Vietnam, which is capable of recording conversations and tracking the geographical location of targets through built-in GPS. It was also found by two Egyptian activists that a FinFisher quotation in Arabic letters was prepared for the Egyptian government regarding FinFisher products and their prices in 2010. As of March 2013, Citizen Lab identified FinSpy command and control servers operating in 25 countries. This global reach brings up ethical concerns about the use of such new technologies, which are aimed only for monitoring criminals and terrorists. These publicized examples of the use of FinFisher show that FinFisher was used against human rights activists and opposition groups, rather than criminals and terrorist. Therefore, there is the risk of abusing such technologies.

The use of new technologies is of utmost importance in the fight against crime. Information and communication technologies are always changing; therefore, keeping up with these new technologies is of high importance to law enforcement. Criminals, especially organized criminals, are adept at following and using new technologies to a greater degree than governments and law enforcement agencies. FinFisher IT intrusion tools can be useful for law enforcement agencies of governments in their fight against crime. However, the use of such new technologies by law enforcement officers in investigations and operations must not violate the privacy of individuals.

FinFisher IT intrusion tools have the potential of invading individuals' privacy. They can extract the private and personal data of individuals, break into their e-mails or social network accounts, intercept their conversations, and even take surveillance of them by turning on Web cams and microphones. Therefore, law enforcement

officers have to use such new technologies after obtaining a judicial warrant upon probable cause, especially when they are otherwise unable to obtain data. Furthermore, it must be guaranteed that these kinds of tools are only sold to the law enforcement agencies of democratic governments. Otherwise, these tools can be a very dangerous weapon in the hands of totalitarian or repressive regimes, cyber criminals, identity thieves, or privacy invaders.

Firewalling

Advances in information and communication technologies have vastly improved the connectivity of individuals and organizations and flow of information around the world. The arrival of the Internet specifically provided an unimaginable pace for advancing the process of globalization. It has linked people around the world who have never seen one another. People communicate with each other daily, for the most part without restrictions imposed by state sovereignty. However, these advances have also paved the way for criminals to commit crimes that are easier to carry out than traditional crimes. Every step of technological progress has increased the use of technology as a weapon of crime. For example, just as the

Internet has contributed to globalization by providing a cheap and reliable form of communication, it has opened the door to cyber crimes that can severely damage computer systems. In parallel with the extensive use of the Internet, cyber crime is increasing each year. Individuals, organizations, and governments should take several precautions to ensure that they are protected from the actions of cyber criminals. Firewalling is one of the precautionary measures that can prevent cyber attacks.

A firewall is a computer software device or piece of hardware that prevents cyber attacks derived from the Internet such as Trojans, viruses, and worms. They can prevent unwanted network packets from reaching their destination, and allow the desired packets to continue to their destination according to filtering rules. In this respect, firewalling can be regarded as a traffic control device that decides what will pass, and what will not. It ensures that computers are less vulnerable to cyberattacks and that the data on computers are more protected.

Configuration

Firewall filtering rules can be customized according to IP addresses, domain names, keywords, or phrases, ports, and protocols. In this respect, a firewall can block off certain IP addresses, it can restrict access to certain domain names or domain name extensions such as .gov or .org, and it can block the data flow on the network if it contains any keyword defined by the filtering rule. For instance, a person who is administering firewalling can prepare a list of Web sites that users are not allowed to access. Apart from limiting access to dangerous or malicious Web sites, a company can block its workers' access to social networking sites such as Facebook, Twitter, LinkedIn, or YouTube in order to prevent workers from wasting their time.

Similarly, a list of keywords or phrases can be prepared as part of a firewall filtering rule in order to block access to Web sites containing those keywords or phrases. Thus, users' access to harmful or unwanted Web sites can be prevented. Users can only see a message delivered by the firewall at their Web browser saying that the Web site that they are trying to access is blocked by a firewall. By this process, there is no available exposure

to harmful content from the blocked Web sites because the connection between a user's computer and a targeted Web server is prevented before it can be established.

A firewall can also allow or block Internet traffic according to communication protocols such as an Internet protocol (IP), which refers to a Web surfing process carried out by Web browsing, an file transfer protocol (FTP), which is based on file transferring between computers over the Internet, and simple mail transfer protocol (SMTP), which is for e-mail trafficking. By filtering a FTP's access, for example, users can be prevented from downloading programs or files to their computers that can be embedded with malicious codes or programs.

Port blocking is another firewall filtering rule that can be defined by users. The Wi-Fi or LAN network cards of computers have about 65,000 different ports, or "paths" to establish data links with other computer systems over the Internet. For example, when a user opens a Web page using a Web browser, the 80th port of the network device is used to reach this Web page. However, for secure Web browsing, the 443rd port is used to reach an SSL certificated web page. In this respect, a firewall rule can be defined, for example, to block unsecured Web browsing by blocking the 80th port communication while allowing the 443rd port communication to remain open for purposes of secure Web browsing.

Limits

Although firewalling is an essential protection method of cybersecurity, it does not guarantee full protection from cyberattacks. Firewalls cannot prevent the transfer of malicious codes or programs. For example, if the access to a certain Web site embedded with malware is allowed according to the filtering rule, users can load the malware to their computers by unintentionally accessing this Web site. Second, hackers can masquerade as trusted users of a network secured by a firewall, and can bypass firewalling using the login names and passwords belonging to trusted users. Third, firewalling controls data flow, but it does not encrypt the data flowing through the firewall. Therefore, there is always the risk of compromising the crucial and confidential information sent over the firewall to the outside or sent between

the computers of a local network secured by a firewall. Fourth, firewalls are configured according to the filtering rules defined by trained users. If there is a problem in configuration, then there is a problem with security. Last, the failure of a user in the network can threaten everybody in the network, even if the network is protected by a firewall.

In light of the escalating use of all forms of online and social media platforms in virtually every aspect of both candidate and issue-oriented politics, the limits of firewalls suggest an entirely new type of threat to citizen privacy. These little-known and often misunderstood limitations on the protections offered by firewalling combine with overt tagging and tracking behaviors to further erode citizen privacy, unwittingly increasing the risk of malicious and/or destructive consequences of participating in digital age engagements.

Fiscal Cliff Crisis

The fiscal cliff crisis refers to a series of policies in January 2013 that might have resulted in tax increases and government spending cuts. The fiscal cliff would have led the United States toward a mild economic recession and higher unemployment. It was named by Ben Bernanke, former Federal Reserve Board chairman. This crisis occurred

in part because of several Bush-era tax cuts and many other tax provisions. In order to prevent the fiscal cliff crisis from happening, President Barack Obama and the U.S. government came up with plans to help the United States survive the crisis. However, President Obama and Congress struggled to reach a compromise on this contentious issue.

At the end of 2012, intense debate and media coverage about the fiscal cliff crisis drew public attention throughout the country. The media paid close attention to this battle. President Obama utilized social media to propagate his fiscal cliff plan and drum up support from people. He called on Americans to use social media to pressure Congress and support his plan. On Obama's Facebook page, there was the quote: "When the American people speak loudly enough, lo and behold, Congress listens." This was what he had said earlier at the White House in front of television cameras and a select group of middle-class taxpayers.

In addition, Narwhal, an Internet marketing system, was used by Obama to help shape the public debate over fiscal cliff negotiation. It was used to coordinate e-mail lists, social media research, and old-fashioned campaigning. President Obama made full use of his campaign Web site, Obama for America, to send supporters e-mails that promoted his stance on the fiscal cliff and encourage recipients to spread the message. This e-mail listed Obama's fiscal cliff proposal: extending tax cuts for 98 percent of Americans and 97 percent of small businesses, ending the tax cuts for the top 2 percent of Americans, and enacting more than \$3 trillion in cuts. Obama emphasized that his plan concerned "what is the best for the middle class." The e-mail declared, "The president is fighting for you," and, "Your voice and action helped reelect President Obama."

Moreover, a series of infographics that illustrated Obama's argument were displayed on the Obama for America Web site with large "share" buttons, which people could click to "spread the word on Facebook and Twitter."

In a survey that the Obama for America campaign conducted among its volunteers after the election, nearly 80 percent indicated that they would keep volunteering, especially around the president's legislative agenda, so the administration attempted to follow up on this promise and

President Barack Obama writing a tweet beside Twitter cofounder Jack Dorsey during the first Twitter Town Hall at the White House on July 6, 2011. President Obama later held Twitter sessions in 2012 to build support during the fiscal cliff crisis.

keep supporters engaged through social media and other methods.

In a speech, Obama urged people to send a tweet to their congressmen to express their favor for his middle-class tax cuts plan. Later, in December 2012, Obama participated in a brief Twitter question-and-answer session. The keyword or hashtag for this session was My2K, which stood for “my \$2,000.” This was the average amount of money that most people would have to pay if Bush-era tax cuts policy expired. The My2K campaign personalized a complicated fiscal debate. More than a quarter of a million people used the hashtag and addressed their concern. Obama picked up eight tweets to answer, such as the question: “What is your opposition to taking away deductions for the 2 percent rather than up the rate? Seems like a reasonable compromise.” Most of the tweets and Obama’s answers reinforce his position on taxes and address concerns about losing tax deductions in fiscal cliff negotiations.

However, Obama’s use of social media as his public relations machine was called into question. From people’s comments and opinions in social media, the fiscal cliff deadlock jeopardized people’s faith toward the government. Some news reports pointed out the angry tone of many posts

on social media. The analysis about “what people were saying and how they were expressing their political opinions about the fiscal cliff and the negotiation on Twitter” revealed that 22 percent of the conversation mentioned the fiscal cliff through jokes and wordplay, and 24 percent of the social opinions were “based on strong negative emotions, including anger, disappointment, and fear.” In 18 percent of the conversation, social media users discussed their opinions about “who had the right ideas about the country’s fiscal and tax situation, and who is to blame for the failure to meet the midnight deadline.” Emotions took over during the fiscal cliff negotiation on social media. *Fiscal cliff* even topped the list of words that people wanted to ban in 2012 because it was overused by media outlets.

Ali Velshi, a CNN anchor, used the word *embarrassment* to describe the fiscal cliff negotiation. This battle was well publicized throughout the world. The coverage in foreign media not only critiqued this crisis, but also viewed this crisis as a sign of American decline. Although the fiscal cliff did not occur, and the U.S. Senate, U.S. House of Representatives, and President Barack Obama had achieved the consensus, the debt ceiling was not changed, and the budget sequestration was only delayed, which might bring more problems and debate in the future. President Obama received his class-warfare trophy in this battle because his social media weapons were powerful, but the fiscal cliff was just one battle in a long war.

Flaming

Internet flaming is a phenomenon that has evolved with the emergence of the Internet in society's communication. It is thought that the term *flaming* first appeared in 1983 in the *Hackers Dictionary*. It was defined as rapid and incessant tangential communication, or speaking ridiculously. As the Internet's presence grew, so did the scope of the behaviors considered as flaming. In general terms, flaming is deliberate, computer-mediated messages that have the intent of insulting an individual or group. Flaming is provocative communication that is not intended to be conversational. As the Internet has expanded over the years and the use of technology has increased, so has flaming. Flaming can be found on newsgroups, mailing lists, forums, text messages, Web sites, and other forms of mediated communication. There are said to be several characteristics and types of flaming.

Characteristics

When thinking of flaming, the dominant feature is the strong emotional basis of the messages, including their aggressive nature. Messages are repetitive and usually insulting to the target. The tone of the messages is hostile. Scholars M. Parks and K. Floyd, in 1996, described flaming as "verbal aggression, blunt disclosure and non-conforming behavior." Because flaming is non-conforming behavior, it breaks the normative rules of discourse including appropriate use of language, expression of emotion, self-control, turn-taking behaviors in regulating conversation, and civility.

Flamers, or authors of flaming messages, often feel uninhibited, and this allows them to use coarse and often profane language. Flamers exhibit hostile emotions that are often expressed in great intensity. Feelings are communicated unedited and unfiltered. Because of the emotionally charged exchanges, flamers appear to lack self-control. Communicative episodes are no longer conversational in tone.

The original definition of flaming in 1983 makes mention of the tangential nature that flaming can possess; this tangential nature marks the lack of self-control to regulate interactions. An important aspect of healthy and effective communication is

appropriate turn taking. In a nonflaming interaction, individuals almost naturally take turns talking or exchanging messages. When one person monopolizes the talk floor, the interaction loses its balance. When imbalance is present regarding talk-floor regulation, individuals tend to feel less satisfied with the interaction. Flamers appear to be less aware of the social cues or are uninterested in responding to them.

The last noteworthy characteristic of flaming messages is the lack of civility that the interaction creates. Communication creates and builds relationships, as well as reshapes and destroys them. Flaming does not seek to build community. Flaming thrives on negativity.

Motivation and Types

The motivation behind flaming is unclear. Individuals write flaming messages for various reasons; sometimes, flaming is the result of the degeneration of an emotionally charged topic. As in face-to-face interactions, new members to Internet communities can be hazed into the group via flaming. Sometimes, a person is trying to get attention or provoke angry responses from others, which is called trolling. Flame trolling occurs when one person posts a particularly offensive and aggressive message targeted at enraging a group. The initial message that a troll posts is referred to as flame bait. The purpose of this message is to cause an intense reaction among the targeted group members. It is thought that the intention of trolls is to disrupt the group's harmony and sense of civility.

Trolls can often, but not always, start what is referred to as a flame war. When trolls are successful in creating discord, often infighting among group members will emerge. Flaming is a particularly destructive element in social media and online political discourse because it tends to polarize participants and/or shut down meaningful conversation altogether by belittling opposing opinions and destroying the environment of respect required for mature political disagreement.

Flash Mobs as a Political Tactic

Flash mobs are a recent global, social phenomenon that involves the aggregation of people in a predetermined public space for a brief period of time in order to commit a performative act that can include dancing, singing, or even nonsensical activities.

Derived from smart mobs, wherein artists perform to publicize their work or a particular cause they support, flash mobs are similarly intended to capture public attention and are typically enacted in nontraditional venues. The dependence of flash mobs on social media and mobile technologies is apparent because these events are predominantly organized through various social media platforms and mobile devices, some in a very spontaneous manner. In many instances, flash mobs are video recorded and posted online for posterity.

While some believe these acts to be random, many of the choreographed spectacles suggest that they have been previously rehearsed. According to Georgiana Gore, the first flash mob took place on June 2003 inside of Macy's department store in New York City. Organized by the senior editor of *Harper's Bazaar* fashion magazine, the event consisted of more than 100 people gathering for 10 minutes around a carpet, which sold for approximately \$10,000, and before quickly dispersing, discussing among themselves and with the salespeople purchasing of the "love rug" for use at their free-love commune.

Flash mobs range from the politically charged to the commercial. Flash mobs that denounce

unfair labor practices are just as commonplace as those that sell a product. An example of a political flash mob involved the retailer Target. In 2010, Target came under attack when it was revealed that because of a Supreme Court decision known as *Citizens United* that allowed for unregulated political spending by corporations, the company donated \$150,000 to an antigay and anti-labor-rights candidate for the state of Minnesota. Funded by the political action group MoveOn.org, a flash mob converged on a Target store, singing and dancing to the Depeche Mode-inspired song "Target Ain't People."

Commercial advertisements that incorporate the use of flash mobs to promote their products are increasing. A notable example involves the T-Mobile dance, filmed at London's Liverpool Street subway station in the United Kingdom. A brainchild of the advertising firm Saatchi & Saatchi, the T-Mobile dance flash mob was performed by thousands of people at 11:00 A.M. on January 15, 2009, accompanied by a medley of songs. Initially, a single male began dancing to the song "Shout" in the middle of the subway station. He was quickly joined by a few more individuals, and the number of dancers grew exponentially as bystanders appeared to spontaneously join in the dance for the duration of the two-minute and 41-second advertisement. At its peak, thousands of people of all ages actively partook in the dance and significantly outnumbered the onlookers before quickly dispersing as the music ended. The advertisement for T-Mobile, a European-based mobile communication service provider, was subsequently shown on television and uploaded to YouTube.

As P. S. Grant, A. Bal, and M. Parent suggest, flash mobs enhance connectedness, positive emotions, consumer arousal, and consumer-to-consumer interaction. The popularity of T-Mobile's advertisement should come as no surprise; as evidenced by well over 36 million views on YouTube, the T-Mobile dance clearly exhibits both the cleverness of the advertisement and the appeal of flash mobs.

Law enforcement officials are fairly unanimous in their opposition to flash mobs, which is typical of the reaction other youth-inspired movements have elicited in the past. Appearing disinterested in differentiating between flash

An example of a flash mob organized for political purposes on October 12, 2012. This group came together to dance in Dupont Circle in Washington, D.C., as one of at least 19 simultaneous Dance for Obama flash mobs that gathered that day to support the 2012 Obama presidential election campaign. Photographers then posted photos of the event like this one on the photo-sharing site Flickr.

mobs and flash robs—organized criminal acts of shoplifting, stealing, and robbing both businesses and individuals that are perpetrated by groups of criminals—the language and descriptors used by law enforcement officials to describe spectacles of flash mobs include the newest crime wave, criminal flash mobs, the dangers of flash mobs, a concern for law enforcement agencies and local governments.

In fact, partly as a response to the recent increase in flash robs, law enforcement leaders are now using social media and communication technologies to respond to criminal activities and help assist in preventing crimes in their respective communities. Perhaps the response by law enforcement to flash mobs should not be surprising. As Tom Vanderbilt suggests, authorities and elites have had a longstanding distrust of crowds and often equate these gatherings with panics and other irrational behaviors.

However, most important is the understanding that flash mobs are meant to be nonviolent spectacles that create publicity and awareness for

political purposes. As such, the political use of flash mobs is equally well documented. In January 2012, more than 250 Israeli women participated in a flash mob to protest the segregation of women in public spaces, taking over the Old Beit Shemesh city square and dancing to “Don’t Stop Me Now” by the rock group Queen. Another widely publicized flash mob occurred during the 2012 U.S. presidential election. Dance for Obama flash mobs spread across 19 cities on October 12, 2012, when at exactly 3 p.m. Eastern Standard time, supporters participated in a choreographed dance with music that incorporated the president’s campaign logo, “Forward.”

As these many examples illustrate, flash mobs are creative and energetic, bringing people together to express political passions and protest or to enjoy a comedic or farcical moment in public spaces.

Fleming, John

Congressman John Fleming M.D. is a family physician from Minden, Louisiana. He is the representative to the U.S. House of Representatives from Louisiana's Fourth Congressional District. The Fourth District covers much of northwestern Louisiana from Shreveport to Kinder, with the Texas border at its western edge.

John Calvin Fleming, Jr., was born July 5, 1951, in Meridian, Mississippi. He grew up in a poor, working-class home in Lauderdale County. The family has deep American roots, which enabled him to join the Sons of the American Revolution and the Jamestown Society.

While he was still quite young, his mother became disabled and was unable to work. His father died of a heart attack shortly before he graduated from high school. Without family support, he had to work his way through college. He attended the University of Mississippi in Oxford,

graduating in 1973 with a B.S. degree. From early childhood, Fleming had an interest in medicine. His grandmother was a hospital nurse who told him stories from her nursing work. The stories were exciting and gave him a desire to learn medicine. His questions to her and others were scientific questions, such as why patients bled and how doctors stopped the bleeding.

Medical Career

Soon after graduating, Fleming entered the University of Mississippi School of Medicine in Jackson, Mississippi. In 1976, he was awarded an M.D. by the University of Mississippi. Between graduation in 1976 and 1982, he served in the Navy Medical Corps as a medical officer. It proved a good experience for extending his medical education.

Fleming's medical service in the U.S. Navy began at Camp Pendleton, California, where he was the chief resident in family medicine. He also trained in drug and alcohol treatment at the Navy Regional Medical Center at Long Beach, California. He then practiced military family medicine in Guam. Between 1979 and 1981, he served as the chairman of the Navy's Family Advocacy Committee. He also was the director of drug and alcohol treatment. Transferred to Charleston, South Carolina, he performed similar duties in drug and alcohol abuse treatment.

In 1978, John married Cynthia Bishop "Cindy" Fleming, with whom he had four children. All are now adults, and the couple has two grandchildren. Cindy is associated with several family businesses, including Bishop Properties, Fleming Subway Restaurants, Fleming Postal Services, Fleming Franchise Development, Fleming Salons Development, Fleming Dating Development, and Fleming Leasing.

After completing his service in the Navy, Fleming moved to Minden, Louisiana, in 1982, where he established his medical practice. The American Board of Family Practice awarded him certification. He joined the staff of Minden Medical Center and the Louisiana Academy of Family Physicians. In the Minden Medical Center, Fleming worked with chemically dependent people in the New Beginnings program.

In 2006, Fleming published his book, *Preventing Addiction: What Parents Must Know to*

Immunize Their Kids Against Drug and Alcohol Addiction. It discusses the progressive and incurable nature of addiction. He offers hope that addiction can be treated, but recovery rates are very low, he concludes. So, prevention is the best insurance against a life of drug addiction and its associated family misery. Much of the focus of the book is on children and how to help them avoid drug abuse. In 2007, he was named Louisiana Family Practice Physician of the Year by the Louisiana Academy of Family Physicians.

In addition to his medical practice, he has been involved with several nonmedical businesses. These businesses employ more than 500 people. Among his businesses are 33 Subway sandwich shops, which are located in northern Louisiana. He also owns Fleming Expansions LLC, which is a regional developer focused on building for the UPS Store. An incident in one of Fleming's Subway shops brought the accusation that a Muslim couple was refused service because of their religion. A review of the surveillance tapes proved the accusation to be false.

Dr. Fleming is a member of the First Baptist Church of Minden. He has served there as a deacon, Sunday school teacher, and school department director.

The Webster Parish Coroner Office is located in Minden, Louisiana. Between 1996 and 2000, Fleming served as the Webster Parish coroner. It is an elective office. He had entered the race for the coroner's office in 1987 against incumbent Dr. Charles Hancock. However, Fleming withdrew when he found that it would require too much time away from his medical practice. In 1995, Dr. Carl A. Hines, the incumbent Webster Parish coroner and a local Minden Democrat, decided not to seek re-election. Fleming, running as a Republican, defeated Dr. Carlos A. Irizarry, who was running as a nonpartisan. Fleming garnered 7,842 votes (60.6 percent) to 5,143 votes (39.6 percent) for Irizarry.

House of Representatives

In 2008, Fleming learned that Jim McCreery, the Louisiana Fourth District Representative to the U.S. House of Representatives, announced his retirement. McCreery had held the seat for 21 years. Fleming entered the Republican primary, a closed primary. Both the primary and the runoff

election that followed were delayed because of Hurricane Gustav. When the primary was held on October 4, 2008, Fleming led with 14,500 votes (35.1 percent) over Jeff R. Thompson, a lawyer from Bossier City, who had 12,693 votes (30.8 percent); and Chris Gorman, who got 14,072 votes (34.1 percent). The runoff primary election was held at the same time as the national election on November 2, 2008, in which President Barack Obama was elected.

Fleming won the runoff election. His vote total was 43,012 votes (55.6 percent) to Gorman's 34,405 votes (44.4 percent). His victory was solid because he carried 12 of the 13 parishes in the Fourth District.

Managing Fleming's campaign for the House of Representatives seat was Dewey Lee Fletcher Jr. (1966–2009), a well-known political consultant. He used a talk show host and blogger in nearby Monroe, Louisiana. He had previously been the chief of staff for Congressman John Cooksey of the Louisiana Fifth Congressional District.

The disruption caused by Hurricane Gustav in late August and early September 2008 delayed the campaign for the general election for the House seat until December. This gave Fleming time to receive support from powerful sources. Medical lobbying groups supported his campaign. These included the Louisiana Academy of Family Physicians and the American Academy of Family Physicians' political action committee. In addition, Vice President Dick Cheney came to Shreveport to support Fleming's campaign by speaking at a fundraiser. On December 2, outgoing Congressman McCreery spoke in favor of Fleming when he appeared on the *Moon Griffon Show* radio program, syndicated across many Louisiana media markets.

Campaign arguments used included the claim that, if Fleming's opponent won, his first vote would be for Nancy Pelosi (D-CA) to be speaker of the House of Representatives. Fleming supported the fair tax idea as a replacement for income tax. The fair tax would raise revenue on consumption, with a top level of 23 percent. Overall, he sought a sound economic policy, sound energy policy, and reduced taxes while upholding the U.S. Constitution.

In the general election held on December 6, 2008, Fleming defeated Democratic candidate

Paul J. Carmouche. His concession statement was not delivered until December 10, 2008, because the race was close. Fleming received 44,141 votes (47.69 percent), and Carmouche polled 44,141 votes (47.69 percent), while two other candidates, Chester T. “Catfish” Kelly and Gerard J. Bowen of Bossier City, received 3,245 votes and 675 votes, respectively. The final tally gave Fleming a district-wide margin of 356 votes. The victory made Fleming the second Republican to be elected in the district since Reconstruction.

In 2010, Fleming ran unopposed in the Republican primary. In the general election, he was opposed by the Democrat Party candidate, David R. Melville, a United Methodist minister from Bossier City. Reverend Melville’s brother-in-law is former Louisiana Governor Buddy Roemer. The independent candidate in the race was a community organizer from Shreveport, Artis Cash. When the votes were counted, Fleming won re-election with 62.3 percent of the vote, while Melville won 32.4 percent, and Cash 5.3 percent. Fleming, as a physician, ran strongly opposed to Obamacare. He promised voters that he would work to repeal the Patient Protection and Affordable Care Act.

Fleming won the 2012 race on November 6, 2012. He had no opposition in the Republican Party primary, and in the general election was opposed by a Libertarian Party nominee, Randall Lord of Shreveport, a former chiropractor and a psychology student at Louisiana State University. Fleming carried the district with 187,790 votes (75.3 percent) to Lord’s 61,587 (24.7 percent).

Committees

The standing committees are the little legislatures of Congress. They deal with permanent issues that the nation faces, from agriculture to defense. Assignments are very important to members of Congress and to their constituents. Fleming has been assigned to the House Armed Services Committee and the House Committee on Natural Resources.

Fleming is assigned to two of the subcommittees of the Armed Services Committee. The Subcommittee on Tactical Air and Land Forces has jurisdiction over the majority of U.S. Army, Air Force, and Marine Corps acquisition programs. In addition, the subcommittee is responsible for

U.S. Navy and Marine Corps aviation programs and the U.S. National Guard, Army, Air Force, and Marine Corps Reserve modernization and ammunition programs. He is also a member of the Subcommittee on Strategic Forces with jurisdiction over strategic weapons, space programs, ballistic missile defense, national intelligence programs, and Department of Energy national security programs.

The House Committee on Natural Resources handles legislation about American energy, mineral lands, mining, fisheries, wildlife, public lands, and more. It is divided into five subcommittees. Fleming is chairman of the House Natural Resources Subcommittee on Fisheries, Wildlife, Oceans, and Insular Affairs. This subcommittee is responsible for all issues pertaining to wildlife resources, fisheries, oceanography, and insular areas. The insular areas of the United States are its island territories. Having served in Guam with the U.S. Navy, Dr. Fleming is well qualified to encourage legislation benefiting the people as well as insular matters of interest to the Navy as well as to the people of the islands. The Subcommittee on Fisheries, Wildlife, Oceans, and Insular Affairs uses social media, including Facebook, Twitter, YouTube, and e-mail.

Of importance to an oil and gas-producing state is Fleming’s assignment to the Subcommittee on Energy and Mineral Resources. This subcommittee has legislative jurisdiction over energy and mineral resources located on lands and waters owned or managed by the federal government, including oil and gas leasing on lands in northwest Louisiana and the outer continental shelf. In addition, the subcommittee is responsible for the supervision of the government’s collection of energy and mineral royalties. It also uses social media.

Social Media

Social media usage is a growing edge in Fleming’s political work. He uses his official congressional Web page (<http://fleming.house.gov>) as a base. It has links to Facebook, Pinterest, Twitter, LinkedIn, Digg, Tumblr, Reddit, and Stumbleupon. Individual icons allow a visitor to use Really Simple Syndication (RSS), YouTube, Flickr, and Facebook. All of these links enable people join with Fleming, inform him of their views, and support him in his legislative work. There is a search

function for the Web site as well as a search function for legislation and e-mail contact. Another link is to a news room. Beside it is a link to blogs, which is inactive. The news room link leads to both news items and to blogs. E-mail is also available. Photos and videos are also available via links on the page.

Fleming's official campaign Web page (<http://flemingforla.com>) is also filled with social media links. Besides e-mail and Twitter, Fleming's campaign Web page uses a survey link and invites visitors to sign up to take action by volunteering, donating, getting information on events, and e-mailing. There are videos available, and there are news and issues links.

Flickr

Flickr is a photo-sharing Web site that was developed and launched in 2004 by Caterina Fake and Stewart Butterfield. Users upload photographs that can then be privately or publicly shared. The site was one of the early and important social media and social networking sources. Users posted photographs of major environmental disasters and other public events to the site. In 2011, Flickr announced that 6 billion photographs had been uploaded since its founding. In recent years, other social networking platforms have also integrated photo sharing, providing competition to Flickr.

The site was originally included as part of a massively multiplayer online role-playing game (MMORG) that founders Fake and Butterfield created, called Game Neverending. It was developed by Ludicorp in Vancouver, British Columbia, Canada. They hoped that allowing game users to upload photographs would make the game more popular and raise money. The year of its development, 2002, was a difficult time for raising money in the technology industry. Fake states that they did no research on photo sharing, but benefitted from the simultaneous popularity of camera phones. The first photograph on Flickr was a photo of Caterina Fake's dog.

Flickr was launched in February 2004 and started taking off later that year. The developers intended the site to be a money-making venture. It was initially an instant message site, but various elements were added over the course of six months, including tagging, open APIs, Web 2.0, gadgets, and the ability to blog posted photos. In 2005, Flickr was purchased by Yahoo! Inc. The site is free and supported by advertising, but also has professional-level accounts for pay. Users create accounts and now must use their Yahoo!

login IDs to upload digital photographs to the Web site. They create tags for each of their photographs. Photos are collected in sets, rather than in albums.

Flickr was one of the first photo-sharing sites where people could upload photographs in near real time so that photographs of current events and political and social activism might be shared worldwide.

The new media scholar Clay Shirky devotes a portion of his book *Here Comes Everybody: The Power of Organizing Without Organizations* to discussing the power of Flickr as a photo-sharing Web site. He argues that it creates the possibility for people to connect horizontally, without a top-down organizational structure. Because users choose how to “tag the photographs they upload, thereby creating entire categories of topics that multiple users’ photographs will inhabit; the structure of the site is an important change in how organizing occurs. Older photo-sharing Web sites such as Snapfish do not offer tagging, and thus do not create aggregates of multiple users.

In its early years, Flickr served to make near real-time photographs of important events available to the public before traditional media outlets could publish accounts of the events. On December 26, 2004, dozens of photographs of the Indian Ocean tsunami were posted to Flickr. The tsunami was caused by the 9.0 Sumatra–Andaman earthquake off Sumatra, Indonesia, and more than 150,000 people were missing or killed within the first day. Shirky says that the way these photos were purposed illustrates that publicly sharing photographs through Flickr takes on multiple uses. They become a way to share information with those affected and the broader public—about missing people, available resources, damaged areas, as well as the overall impact of the disaster. Flickr is cross-embedded in other social media platforms such as blogging, which also shares information more quickly than mass media outlets.

Shirky notes that the July 7, 2005, London bombings of public transportation were captured by cell phone cameras and uploaded to Flickr. Three underground (subway) trains and one bus were hit by bombs placed by four British men who were members of fundamentalist Islamic groups. The photos related to this event are aggregated

This photo from Flickr shows a man surveying damage from the 2004 Indian Ocean tsunami among ruined houses and flooded land in Aceh, Indonesia, on January 5, 2005.

under the London Bomb Blasts Community pool with tens of tags such as london77 (referencing the July 7 date) or londonbombings.

The Library of Congress has maintained a Flickr site since 2007. It does so in order to broaden the audience for its collection of photographs. The library shares photographs that are high quality, that do not have restrictions placed on viewing, to gain additional identifying information on individual photographs from the public.

Although Flickr continues to be used as a photo-sharing site, its popularity has decreased as the social networking Web site Facebook has integrated photo sharing and as mobile phones have become more widely used. Facebook has a built-in option for taking and uploading photographs, and reports that its users upload more than 100 million photographs a day. Instagram is a mobile phone application that allows users to apply

different filters to photographs to change the hue, shading, and tone of photos, and was purchased by Facebook in 2012. In 2012, a writer for the technology blog Gizmodo questioned whether Flickr might be dead. However, it continues to serve as an archive for larger sets of photographs and as a site for professionals to pay to host photographs in large quantities.

Flog

A flog, or fake blog, may have the same interface as a credible blog, but this blog's purpose and its author(s) are usually dissimilar. The purposes of flogs range from promoting a product to discrediting a person or company. The authors of flogs might range from a company, marketing agency, public relations agency, or individuals who seek to discredit others. Flogs usually look like legitimate blogs, but they might be registered to a service (discoverable through Whois), which hides the domain owner. Sometimes, these flogs are discovered and made accountable by actual bloggers on the Web. When these flogs are found to be fraudulent, bloggers oust them on their social media platforms.

A Flog might promote a spoof or parody or serve as a marketing tool, or it might have a larger purpose to mislead others. Generally speaking, a flog is a blog pretending to be something that it is not. Some flogs focus on positive product reviews for companies. These flogs usually rave about new products that do not warrant positive reviews and cause consumers to waste time and money on products that do not work as intended. Some flogs choose to use actual people's names as pseudonyms to make the content more believable.

Some flogs are health related and focus on supplements, procedures, or other health enhancements that others could adopt to enhance their lives. These flogs adopt astroturfing messages, which are public relations tactics through which the real sponsor of the flog is not identified and the "blogger" appears generally disinterested in the content. Health-related flogs give testimonials to the powers of supplements or procedures. They may even have fake comments asking if the assertions are true, to which another "visitor" would be able to add his or her experience to the conversation. Assuming the identity of a competitor to create a flog is also a form of brandjacking. An example would be creating a flog for a political opponent and posting lewd pictures or posts to mar the candidate's brand.

Flogs may have many posts, but a sure sign of a flog is the one-post blog. Sites with no contact info should be looked at with a critical eye. The flogger may not spend much time customizing the page, using standard templates with no personalization. Fake blogs could also have viruses or other malware.

Legal and Ethical Implications

In the case of public relations, flogging violates the tenets of the professional code set by the Public Relations Society of America. As a professional standards advisory the group reminds its members that "open communication is essential for informed decision-making in a democratic society." Blogs promoting or endorsing a product are also subject to Federal Trade Commission mandates on disclosing whether or not they were paid for their endorsements. Violating the terms of service from the hosting agent (like Google for Blogger and Blogspot) could result in suspension of service. Google's terms of service (as of

November 2012) state that the company may review content to determine if it violates Google policies or is illegal.

Famous Flogs

In 2008, an ad agency created a flog for Walmart titled *Walmarting Across America*. This flog highlighted the pseudo adventures of a couple (Laura and Jim), capturing stories about Walmart as they traveled across America in their recreational vehicle. These “adventures” were actually created by the company, and the real Laura and Jim never actually left home. Laura was a freelance writer hired by a public relations firm to create the flog, and Jim was a photographer for the *Washington Post*. This flog was criticized for its lack of disclosure to the public.

Other well-known flogs include examples created by McDonald’s and Coca-Cola. McDonald’s attempted to garner buzz for a French fry that was discovered to have a surprisingly similar appearance to President Abraham Lincoln’s face. Another flog focused on Coca-Cola’s sugar-free brand, Zero. This blog focused on the zero moments of life and how life might be enhanced by consuming Zero.

In June 2011, a fake blog called *A Gay Girl in Damascus* made CNN headlines when an American man was found to be blogging as a Syrian-American lesbian. The man posted as “Amina,” and even posted that she had been abducted, starting an international incident. Traditional media outlets picked up the story about the abducted blogger, and the U.S. State Department uncovered the true identity of the blogger.

Flogs and Fake Political Web Sites

Flogs and fake political Web sites have a similar aim: deceit. Sites like *DemocraticNationalCommittee.org* or *RepublicanNationalCommittee.org* were set up by an individual with requests to support the “candidate” financially. The sites looked like an authentic site, complete with images of the presidential candidates. ABC reported that a fuel-truck deliveryman was operating the sites and keeping any “campaign” donations submitted. Fine print disclosed that the site was “not connected with any federal elections.” In this case, the sites appear to have been created for monetary gain. Smearing another candidate’s character

or campaign could be motivating factors for other kinds of fake political Web sites, or decoy sites, possibly even operated by an opponent’s camp. Free blog systems, which require no knowledge of coding, make it easier for someone with no Web skills to create a fake political Web site. For candidates, monitoring the digital landscape for such sites is necessary for reputation management.

Political flogs and fake Web sites of national, state, and local campaigns have long been popular on the Internet. The first famous fake Web site in a national campaign appeared in 1996 when Bob Dole ran for president. During his campaign, a Bob Dole Web site emerged during his presidential bid. This was one of the first times that a political campaign had to use public relations tactics to address a fake site focused on a political candidate.

After the Bob Dole incident, flog-based Web sites continue to emerge in various forms. These flogs have been used in the political arena to provide fake information to the public in both candidate and advocacy-based politics.

Microflogging

Flogs were generally created around 2005, but the concept is becoming more popular across new social media platforms like Twitter and Google+. Twitter, a microblogging platform, is attracting a wealth of floggers who create pseudo accounts for people such as President Barack Obama and Texas Governor Rick Perry. These flogs are creating a new movement known as microflogging.

Focus Groups

Focus groups are a qualitative research methodology in which a small group of participants are led through a focused group interview about their attitudes, opinions, and perceptions of a message, product, service, idea, or concept. Focus groups are used when group discussion might provide unique insights or data that would not emerge in an individual interview or survey. Focus groups are common in advertising and message testing, product design and development, political campaign research, problem identification research, and academic research. Robert K. Merton is credited with originating the method when testing group reactions to wartime propaganda and military recruiting materials at the Bureau of Applied Social Research at Columbia University.

In a typical focus group, seven to 12 individuals are led by a single moderator through a series of questions and answers about a product, advertisement, or idea. For example, as part of the product development cycle, a restaurant chain may conduct a focus group with new menu items where consumers can test and discuss a new product before it is made available to the public. Moderators usually work off a common set of questions, but are trained to keep the discussion open, natural, and moving.

Focus groups are dependent on a moderator creating a permissive, nonthreatening environment within the group where the participants feel comfortable discussing their opinions openly and without ridicule. Moderators may also use interview techniques such as free association, mind mapping, product sorts, and visualization. While not a requirement, focus groups are often held in special focus group facilities with double-sided

mirrors to allow concealed observation, kitchens to prepare new foods for taste-test discussions, and media exposure rooms to show films, ads, or other media. Participants are usually paid a nominal incentive stipend for their opinions, and the sessions typically last between 60 and 90 minutes.

Advantages

The primary advantage of focus groups over other research methods is the emphasis on group interaction. Because communication is a collaborative and social process, researchers can benefit from observing the interaction and communication occurring among the participants. The group discussion can spark thoughts, memories, or ideas in the participants, and researchers can detect the vernacular language that the interviewees use to jointly construct a conversation.

Focus groups are considered a more naturalistic approach than one-on-one interviews. Participants are able to see and test products and messages, and are able to express their opinions in a natural and in-depth manner. The method also allows researchers to probe for additional information and ask follow-up questions to clarify a point. Focus groups are flexible and can be conducted more quickly and inexpensively than other forms of market or public opinion research.

Focus groups are often used early in the research process to gather preliminary information or to explore gaps in knowledge at the onset of a study. They are well suited to identifying problems within organizations or campaigns and to generate new product or service ideas by studying the inadequacies of current offerings. Focus groups are often paired with quantitative surveys to further refine the conclusions derived from focus groups with large numbers of randomly sampled participants. In this way, focus groups often serve as a source of preliminary data to develop a questionnaire. Similarly, focus groups can work in tandem with participant observation and individual interviews, when appropriate. Furthermore, focus groups may also follow quantitative procedures to help interpret quantitative results and suggest avenues of future study.

In marketing research, where the technique is common, focus groups are used to investigate what people buy and why they buy; how consumers feel about brands, products, or product

categories; and how products and services are used. More abstractly, focus groups are used to study various lifestyle questions, such as how people spend their time, what makes people happy, what are people worried about, and what goals people have. Because the method is qualitative, focus groups are appropriate for exploring issues related to memory, emotion, experience, and imagery. In addition to examining what people think and how they think, focus groups can investigate why people think the way they do about the topic. Focus groups are often called group depth interviews because the method provides rich and detailed insights and understandings of feelings, thoughts, and perceptions.

Political and Legal Focus Groups

Focus groups have also become essential tools in political campaigns. Political consultants rely on focus groups to test lines of argument and attack; evaluate the effectiveness of speeches, ads, and debate responses; and ascertain what voters are looking for in a candidate. Republican pollster Frank Luntz is known for using focus groups to develop words and phrases that help Republican candidates frame issues and move public opinion to their advantage. Luntz advocates that Republicans use focus group–developed language, such as *climate change* instead of *global warming*, *death tax* over *estate tax*, and *energy exploration* in place of *oil drilling*. Luntz has received criticism for his efforts; for example, PolitiFact gave him the 2010 Lie of the Year award for his promotion of the phrase *government takeover* to describe the health care reforms advocated by President Obama.

Focus groups are also used in other contexts. Lawyers hold pretrial mock juries with focus group participants matched to the profiles of potential jurors to discover what issues might come up in the trial and which arguments and pieces of evidence would be most persuasive to eventual jurors. Focus groups can reveal deficiencies in a case and allow lawyers to assess witness testimony and other elements of the case. Packaging and product design is another common use of focus groups. Through usability testing and discussions of packaging characteristics, designers can better understand what product elements need revision. For instance, a car maker may conduct

focus groups after test drives of a new car model to see if the seats are comfortable, if the controls are easy to use, and if the dashboard is logical.

Disadvantages

There are several disadvantages of focus groups, and focus groups are susceptible to several external validity threats. The moderator may artificially influence the discussion, researchers may be biased in their analysis of the group, participants may be vulnerable to social desirability bias and say what they believe the moderator or other participants want to hear, discussions may produce conformity of opinion or group think, and the results from a limited number of groups may not be generalizable to other contexts. Like other forms of market and social science research, focus groups are dependent on self-reported data, and some topics are not feasible for group discussion. Among many designers and artists, focus groups are seen as antithetical to the artistic process. For example, Steve Jobs, the cofounder, chairman, and chief executive officer of Apple, famously said, “It’s really hard to design products by focus groups. A lot of times, people don’t know what they want until you show it to them.”

Virtual Focus Groups

Virtual focus groups are now commonplace. With this approach, prescreened participants log onto teleconferencing software at a predetermined time to participate in an online focus group. As with face-to-face groups, interviewees can see and hear each other and have a real-time discussion about the topic. Interviewees for online focus groups are usually recruited through online panels, and the method allows organizers to easily gather qualified participants from around the world to match the desired research criteria. This approach is normally less expensive than traditional focus groups because moderators and facilitators are not required to travel to the participants. Focus groups can also be held over social media platforms. Companies can create social media apps that allow them to survey and interact with their customers. Facebook and Twitter posts can be mined to identify emerging trends. This process, called social listening, is the next frontier of qualitative research, and is still under development.

Dial Focus Groups

Another type of focus group is a dial focus group. In a dial group, participants register their opinions confidentially on wireless, handheld dials. Participant opinions can be electronically gathered, aggregated, and instantly analyzed, after which the moderator can use follow-up questions to discuss why the group, or subsets of the group, responded the way they did. Dial focus groups are used for television, film, advertising, and other forms of media audience research. It is rare for a movie or television studio to release a film or television show without first evaluating the program with a dial group. Researchers can track the audiences' second-by-second evaluation of the message to see which elements receive a positive response and which sections are negatively evaluated.

Additionally, dial focus groups are prominent features of political news. During the 2008 and 2012 U.S. presidential debates, CNN used dial focus groups to provide viewers a real-time, on-screen reaction graphic showing undecided voters' reactions to the candidates.

Folksonomy

Folksonomy refers to the ability of individuals to annotate and categorize content, particularly Internet content. The term is a combination of "folks," an informal reference to people in general, and "taxonomy," the science of creating categories. Also known as "social tagging," the creation of folksonomies is one of the central characteristics of many Web 2.0 services. Folksonomy refers to the complete body of user-created tags, but the word is also used to describe the act of users creating tags. Information architect Thomas Vander Wal is generally credited with first coining the term in 2004.

Folksonomies have been characterized as bottom-up, self-organizing systems that are idiosyncratic, rather than systematic. Empirical analyses of folksonomies find that shared vocabularies emerge from popular categorization. However, social tagging has been criticized for its potential to introduce key words and Internet metadata of doubtful quality that may inadvertently spread popular misconceptions.

Supporters state that folksonomies may increase the capabilities of the Semantic Web, a project by the World Wide Web Consortium (W3C) to evolve the Web from a network of documents to a network of data by enabling systems of categorization based in social practice. To what extent the emergent thesaurus qualities of social tagging may replace or improve upon existing forms of classification remains to be seen.

The social bookmarking site Delicious and the photo site Flickr were the first Web sites to popularize social tagging, which has since become a standard feature on many sites with user-generated content, including Facebook and YouTube.

Uses of Social Tagging

A tagging system is comprised of the interaction of three elements: the users, the objects that are tagged, and the tagging key words. Social tagging systems are generally used in three ways: (1) as a tool for personal data organization, (2) as a platform for sharing information with friends and colleagues, and (3) as a method of crowd categorization.

Social tagging as a tool for personal data organization is most evident in sites like Flickr and

Delicious, where users tag photos and links with keywords that are saved to be reviewed later. The practice of tagging photographs with the names of friends on Facebook is a good example of using social tagging for sharing information with others in a social network. Professional or special-interest communities may use alternative spelling tags to differentiate their use of a keyword term from more casual uses.

Crowd categorization occurs on sites where individuals may apply keywords to resources, resulting in a collective system of organization. For example, on Flickr and Delicious, users assign tags, or keywords, to photos they upload or links to interesting Web sites they want to save. On Flickr, users may assign tags to photos taken by others, broadening the keywords associated with a particular image. On Delicious, many users may submit links to the same sites, assigning tags that are similar to or different from tags created by others. Delicious is a broad folksonomy because many people tag the same items. Flickr is a narrow folksonomy because although many people engage in tagging, individual photos are tagged by very few people.

Social tagging has the potential to improve a site's search engine optimization as more individuals who tag an Internet resource also help define it. Search engine algorithms are generally thought to give positive weight to social tagging when calculating page ranks, particularly to resources that are referenced in social bookmarking sites like Delicious.

Forbes, J. Randy

J. Randy Forbes is the Virginia Fourth Congressional District representative to the U.S. House of Representatives. He is a Republican and is actively connected to many Virginia political social media accounts.

James Randy Forbes was born February 17, 1952, in Chesapeake, Virginia. He graduated from Great Bridge High School in Chesapeake in 1970. He was valedictorian of his class at Randolph-Macon College in 1974, graduating with a bachelor in political science. In 1977, he took a J.D. degree from the University of Virginia School of Law. He then worked in private law practice, specializing in work with small and medium-size firms. He eventually became a partner in a ranking law firm in Tidewater, Virginia.

Forbes continues to make Chesapeake his home with his wife Shirley. Together, they have four children. He identifies himself as a Southern Baptist. He attends Great Bridge Baptist Church, where he has taught adult Sunday school for more than 20 years. He is a member of the American Bar Association, Cancer Working Group, Chesapeake Bar Association, Chesapeake Farm Bureau, Chesapeake Fraternal Order of Police Auxiliary, Chesapeake Parent Teacher Association (PTA), Parents' Council, James Madison University, Mothers Against Drunk Driving, National Leadership Council of the New Majority Council, Omicron Delta Kappa, Phi Beta Kappa, and the Virginia State Bar Association.

First elected to public office in 1990, Forbes won a seat in the Virginia House of Delegates, which is the lower house of the Virginia General Assembly. He became one of 100 delegates meeting in the capitol building in Richmond, Virginia. Members serve two-year terms and are elected in odd-numbered years with inauguration occurring in the following even-numbered year. While in the House, Forbes served seven years as the House Republican floor leader.

From 1997 until 2001, Forbes served in the Virginia State Senate, where he became the Republican floor leader in his second year of service. He also served as the chairman of the Republican Party of Virginia from 1996 to 2001.

In 2001, Forbes won election to the U.S. House of Representatives in the 107th Congress

to fill the vacancy in the Fourth District. The incumbent representative, Norman Sisisky, a Democrat, died while in office on March 29, 2001. Sisisky was a very blue-dog Democrat. He was possibly the most conservative Democrat in the House at the time of his death.

In the special election to fill the unexpected vacancy, Forbes faced Louise Lucas, a Democrat serving in the Virginia Senate. He won with 52 percent of the vote to Lucas's 48 percent. His election was aided by campaigning in the district election for him by Vice President Dick Cheney, Barbara Bush, former first lady and the mother of President George W. Bush. Bush and Cheney used automated phoning as a campaign tool in order to promote Forbes's election. Forbes attributed his victory to the aid provided by President Bush.

2002–2010 Elections

In 2002, he ran for a full term unopposed by a Democrat. In 2004, he was opposed by Jonathan R. Menefee, a young U.S. marine who had been honorably discharged because of a service-related injury. Menefee was a 26-year-old law student in California when he attempted to capture his home district's seat. He was an inexperienced candidate whose stand on many issues ranged from progressive to libertarian. A Democrat, he was financially supported by the Chesapeake Democratic Committee. Nottoway Democrats also contributed to his campaign. He received 35 percent of the vote to Forbes's 65 percent. After his defeat, he left the district and eventually moved to Chicago.

In 2006, Forbes was unopposed in his re-election. The Fourth District had been realigned following the 2000 census, so it was more difficult for a Democrat to win. In the run-up to the election of 2008, Forbes raised nearly \$1 million dollars for his campaign war chest. He defeated Andrea Miller in the election of 2008.

Andrea Miller, who some characterized as a very liberal political unknown, was a 54-year-old former college professor and a computer and homeland-security consultant to governments in Northern Virginia, Maryland, and the District of Columbia. She was a newcomer to the Fourth District who had moved into the Summerford subdivision off Winterpock Road in Chesterfield County just two years earlier. Her reason for

Representative J. Randy Forbes speaks with Chief of Naval Operations Admiral Gary Roughead prior to March 1, 2011, budget testimony before the House Armed Services Committee, on which Representative Forbes serves.

moving was to escape the corrupting influences in Columbia, Maryland.

Miller had some political experience as a member of the Virginia Anti-War Network. She had been a regional coordinator for Ohio Representative Dennis J. Kucinich's campaign for the presidential nomination. In 2004, she worked as a regional coordinator for MoveOn.org.

Campaigning on a liberal or progressive agenda by Virginia standards, she wanted American troops out of Iraq immediately, to block drilling for oil off the east coast and in Alaska. Universal health care and a living wage along with limits on carbon and other greenhouse gas emissions and an end to the USA PATRIOT Act were part of her policy positions to be enacted if elected. She would also promote developing and marketing alternative energy sources such as wind or solar to create jobs. She opined that southside Virginia agricultural wastes (tobacco, peanuts, corn, and other vegetation) could

be used as fuels that would be renewable. She rejected the belief of Forbes that the federal government needed to institute an alternative energy source Manhattan Project.

Miller had difficulty raising campaign funds. She was so short of campaign funds that her campaign manager and her financial director both quit because they could not be paid. This action attracted some media attention to her campaign. She had hopes that she would be able to ride the coattails of presidential candidate Barack Obama and Democrat senatorial candidate Mark R. Warner. Even though she claimed to be a computer specialist, she relied on traditional campaigning tools—personal appearances, direct mailing, and door-to-door canvassing. She opened campaign offices in several places in the district. All was to no avail as she was defeated handily by Randy Forbes.

In 2010, Wynne LeGrow challenged Forbes for the Fourth District seat as the Democrat Party's nominee. LeGrow was a naturalized immigrant from Quebec, Canada. He had retired as a physician specializing in nephrology who made his home in Emporia, Virginia. He supported letting the Bush tax cuts expire, declared global warming real and anthropogenically caused, and held other positions that would be opposed by conservatives. Forbes refused to engage in debates or in a public forum on the issues. LeGrow was able to raise \$100,000 in campaign funds, but was only able to get 38 percent of the vote to Forbes's 62 percent.

2012 Election

In the 2012 election, Forbes had his first Republican opposition from Bonnie Girard. She had been an exchange student in China and was concerned about the growing Chinese influence in Washington, D.C. She had developed a consulting company in China, the China Channel Consultants, to aid American firms seeking to do business in China. She unsuccessfully tried to make an issue of the defense contractors that had contributed to Forbes's campaign. In the open primary voting, in which anyone can vote by declaring themselves a Republican, she only received 10 percent of the vote to Randy Forbes's 90 percent.

Running for his sixth term, Forbes faced Democrat Party candidate Ella Ward in the general

election. She had previously decisively won the Democratic Party nomination in the primary election by defeating Joe Elliot, an art teacher from South Chesterfield who was a first-time candidate. She was a retired teacher and administrator. She had served as a Chesapeake City Council member and as a state Board of Education member for eight years. Her victory party celebrated capturing 85 percent of the primary votes.

In 2012, the Fourth District had been realigned following the census of 2010. It is a sprawling district that stretches from the North Carolina border north to the suburbs of Richmond and includes the Atlantic shore, the city of Chesapeake, and much of Suffolk, as well as part of 13 other cities and counties as far west as Notaway. Specifically, it includes Chesapeake City, Isle of Wright, Sussex, Emporia City, Dinwiddie, Amelia, Powhatan, Chesterfield, Petersburg, and Colonial Heights counties.

Many of the people in the district were not strongly devoted to either the Republican or Democratic Party. Participation in party races was often low. However, the issues of jobs and the economy were significantly important to many voters. Others were concerned about the growing national debt, not raising taxes, and the need for less government regulation. These issues were prominent in Forbes's campaigning. In contrast, Ward focused on bringing in new jobs, improving education, and not changing Social Security or Medicare, even if it required higher taxes or increasing the national debt.

Forbes had a good campaign chest of more than \$427,000 to start his campaign, compared with Ward's \$6,540. Ward had to deal with the fact that many Democrats did not want to contribute until after the primary election. She also had to run a low-tech campaign with door-to-door campaigning. Act Blue was used as an online form of social media to recruit supporters and donors to her campaign. Only two signed up to contribute \$1,000. She also gained support from WarIsACrime.org, an antiwar Web page. It castigated him for allegedly voting for the Bush agenda 98.8 percent of the time.

The progressive supporters of the page were bothered by the fact that Randy Forbes had been the founder and was chairing the Congressional Prayer Caucus, which encourages its members

to sponsor initiatives to “protect religious freedom in America and to preserve its rich spiritual heritage.”

Committees

Forbes has been an effective speaker on issues that come before the Subcommittee on Crime. He has engaged in debates on issues of gangs and illegal immigration. He serves on the House Committee on Armed Services. He is a member to two of its subcommittees: the House Subcommittee on Seapower and Projection Forces and the House Subcommittee on Readiness. He is also a member of the House Committee on Judiciary and serves on two of its subcommittees: the House Subcommittee on the Constitution and the House Subcommittee on Crime, Terrorism, and Homeland Security.

Besides founding the Congressional Prayer Caucus, Forbes also founded the Congressional China Caucus. He also belongs to the following caucuses: Army, Navy/Marine Corps, Coast Guard, Special Operations Force, Children’s, Congressional Modeling and Simulation, Congressional Pro-Life, Diabetes, Historic Preservation, House Republican Israel, Immigration Reform, International Conservation, Internet, Military Retiree–Veterans, and the Missing and Exploited Children’s. He is also a member of the Alzheimer’s Task Force, Cancer Working Group, Chesapeake Bay Watershed Task Force, and the Judicial Activism Working Group.

Social Media

Forbes has not had serious electoral competition since entering the House of Representatives; however, he understands the new media and is using it. His congressional Web page issues a weekly newsletter to 85,000 subscribers. The Web site has been recognized by the Congressional Management Foundation as one of the best Web sites in Congress. The *Richmond Times Dispatch* has recognized his Web site as commendable for its openness and clarity of purpose. It uses social media links to blogs, news sites, audio, video, and the China and Prayer Caucuses. In addition, there are links to Facebook, Twitter, YouTube, and Instapoll. Blogs are linked. There is a search function for the Web site as well as a search functions for legislation and for issues.

The House page Randy Forbes uses (<http://forbes.house.gov/>) is loaded with links to his life, to issues, to caucuses, and to news. It also provides a contact point for constituents to request constituent services. He has also used a campaign Web page, which give opportunities to join his campaign as a volunteer or as a contributor. Very prominent on his campaign Web page are videos, Facebook, and Twitter. A link to sign up for e-mail news is also available.

Forecasting Elections

To forecast an election means to declare the outcome before it happens. Scientific approaches to election forecasting include polls, political stock markets, and statistical models. Scientific forecasting offers estimates based on some scientific procedure, such as a simulation, market analysis, sample survey, or statistical model, providing information to leaders and followers about a likely outcome, allowing them to make adjustments they feel necessary.

There are three main components to a forecast: the raw information that is aggregated, the transformation of this information into probabilistic forecasts, and any bias that shifts the stated forecasts. The raw information used by the poll-based forecasts is public and hence should be in the information set of Intrade investors, and beyond this, prediction markets aggregate dispersed and unpublished information. As to transformations, the poll-based forecasts have sophisticated methods for transforming information into probabilities. In addition, it is now possible to correct for biases in reporting or look past the biases for the informational content of the forecast.

Currently, there is considerable interest in election forecasting, and a common goal for these studies is the development of a model inevitably based on aggregate time-series data, which predicts election returns. The resulting models, some of which are quite accurate, can differ a good deal in specification and estimation; also, they vary in complexity, making them more or less accessible to the engaged voter. Some forecasters suggest that such models should be relatively easy to understand and use so that citizens can utilize them.

Other things being equal, a model based on sound electoral theory will perform better than an empirically induced, atheoretical model. The steps for constructing a forecasting model are much the same as for any social scientific regression model: Consult theory, express the theory in an equation, gather good data on the variables, estimate the equation, evaluate the estimates, and judge the fit. Special attention must be given, then, to the question of model fit. Assuming that the model gives a good picture of the real world, the analyst can go on to forecast. Data on the

dependent variable comes from a rather neglected item in national election studies: "Who do you think will be elected president in November?" is the question that has been posed in presidential pre-election surveys since 1956, and the answers allow us to estimate how well the electorate forecasted the winner in each of these presidential contests. What should we expect the estimates to look like? In some ways, the null hypothesis is most plausible; that is, citizens do not possess crystal balls, and therefore their guesses will be essentially random, with some having good luck and others having bad luck.

In Western democracies, guessing who will win elections is a long-standing tradition, and statistical forecasting models started to appear around 1980. There are now many such models for U.S. elections, and a forecasting instrument should be evaluated by four criteria: accuracy, lead, parsimony, and reproducibility. In forecasting, a necessary evaluation standard is accuracy. If a model routinely produces inaccurate forecasts, it is not good. However, accuracy is not a sufficient condition. Besides accuracy, a model must have lead; that is, the forecast must be made before the event: The farther in advance a model produces accurate forecasts, the better; little is gained from a model that forecasts a few days before the election. Such models may be theoretically tautological, not to say empty, and lack the anticipatory feel expected from a true forecast.

A forecasting model should also be parsimonious, as in the principle of Ockham's razor: A few well-specified variables will work better than many questionable ones. The standard of parsimony bears on the last standard, that of reproducibility. In general, parsimonious models are easier to understand and are therefore easier to reproduce. The criterion of accuracy deserves special attention. A model that fits better, forecasts better. For instance, in classical regression analysis, the two measures of goodness of fit are the R-squared (or adjusted R-squared) and the standard error of estimate.

Forecasting is widely used in economics and marketing, for instance. Some models assume the time-series data follows a stationary, stochastic process, including the autoregressive (AR) model and autoregressive moving average processes (ARMA) model, state researchers X. Jin, A.

Gallagher, L. Cao, J. Luo, and J. Han. They conclude that models (e.g., AR_Flickr, SAR_Flickr, and Bass_Flickr) extended to consider the Flickr features can achieve overall lower prediction error compared with traditional models (AR, SAR, and Bass), which only consider sales history. In general, considering the Flickr features gives more robust results, with comparable standard deviation with the SAR models and much lower standard deviation than the AR and Bass models. Social multimedia hosting and sharing Web sites such as Flickr, Facebook, YouTube, Picasa, ImageShack, and Photobucket, are increasingly popular around the globe. A major trend in current studies on social multimedia is using social media sites as a source of a huge amount of labeled data for solving large-scale computer science problems in computer vision, data mining, and multimedia.

Twitter

For instance, the successful use of social media in the U.S. presidential campaign of Barack Obama has established Twitter, Facebook, Myspace, and other social media as integral parts of the political campaign toolbox, according to scholars A. Tumasjan, T. O. Sprenger, P. G. Sandner, and I. M. Welp. While some political analysts are already turning to the Twittersphere as an indicator of political opinion, others have suggested that the majority of the messages are pointless babble, and their study is intended to answer the question whether microblogging messages can actually inform about public opinion and the political landscape in the offline world by exploring whether: (1) Twitter is used as a vehicle for political deliberation by looking at how people use microblogging to exchange information about political issues, (2) Twitter messages reflect the political preferences and the political landscape offline in a meaningful way, (3) individual accounts show evidence of party bias, and (4) the content of Twitter messages can be used to forecast the election result.

User-generated content has experienced an explosive growth both in the diversity of applications and the volume of topics covered by users. Content published in microblogging systems like Twitter is thought to be feasibly data mined in order to take the pulse of society, according to scholar D. Gayo-Avello, and recently a number

of positive studies have been published praising the goodness of relatively simple approaches to sampling, opinion mining, and sentiment analysis. Gayo-Avello attempted to play devil's advocate by detailing a study in which such simple approaches largely overestimated Obama's victory in the 2008 U.S. presidential elections. Twitter is a microblogging service, that is, a system to publish short text messages, or tweets, which are shown to users who are following the author. Many Twitter users decide not to protect their tweets, and hence, they appear in the so-called public timeline. Such tweets are accessible by means of Twitter's application programming interface (API) and they are easy to collect. Twitter's original slogan "What are you doing?" encouraged users to simply share updates about their daily activities with their friends; nevertheless, Twitter has since evolved into a complex information dissemination platform, especially during mass-convergence situations. Twitter users not only provide information about themselves, but may also publish real-time updates on current events.

Social networking is about people with similar interests building a virtual community, and its lynchpin is building trust that leads one to share what is valuable, engaging others to move from taking value to adding value by participating, thereby completing the cycle and creating true collaboration. Social networking can be used by agencies in a variety of ways, ranging from creating cross-government coordination and knowledge management to recruitment activities and supporting event announcements to the public.

Some scholars have found that Twitter is indeed used as a platform for political deliberation. The mere number of tweets reflects voters' preferences and comes close to traditional election polls, while the sentiment of political Twitter messages closely corresponds to the electorate's sentiment and evidence from media coverage of the campaign trail. However, the demographics of Twitter users may raise concerns that samples may not be representative of the electorate. Political heterogeneity and political disagreement are wholly distinct phenomena and within discussion networks they served dialectically opposing roles: Disagreement leads to attitude change, while heterogeneity discourages it. At the neighborhood

level, however, the degree of heterogeneity serves as a heuristic for the electoral viability of candidates, with greater heterogeneity increasing the chances that citizens will change their minds. Moreover, casual conversations among neighbors are a crucial venue of informational exchange about politics. Although a more definitive answer surely awaits future research, informal communications among neighbors and discussants may also play important roles in driving voter volatility and determining voter preferences in other new democracies where partisan cues and party roots in the electorate are weak.

Informal discussion with close confidants, casual acquaintances, and even complete strangers is a wholly rational way for citizens to adapt to the lack of standing information in systems without long-established political institutions or, as in Brazil, where elites have created a highly complex party system. This is not to deny, of course, that citizens in established democracies do not learn or gain exposure to persuasive information through

discussion with peers. It is rather to reiterate that political discussion in new democracies is more meaningful and politically consequential because it can yield massive preference change during election campaigns that determines who governs. What does this suggest about the quality of citizenship in Brazil and other new democracies?

Political behavior scholars often portray political independents with volatile preferences, not as open-minded and inquisitive, but as unaware and manipulable. Comparativists favor stable institutions with deep societal roots. Social network theorists express concerns that deliberation can cause group think, voter cascades with the blind leading the blind, herd behavior, or stampedes. The alternative model, the media exposure thesis, paints an equally unimpressive picture of atomized citizens who are politically manipulable by the media, a scenario reminiscent of the pessimistic mass society model that was in academic vogue a few decades ago. Democratic theorists typically consider deliberation,

Members of the U.S. Navy watching the first 2012 presidential debate between President Barack Obama and former Massachusetts Governor Mitt Romney on October 4, 2012. Beginning with the 2008 U.S. presidential election, election forecasting has begun to more actively tap into the rich data provided by social media, especially such sites as Twitter and Flickr, with varying degrees of success.

especially in heterogeneous settings, as a public good, improving the quality of citizenship and democracy by promoting political tolerance, engagement, and knowledge. Summarizing, the use of Twitter users to predict the outcomes of elections is still a controversial topic.

As of December 2008, 11 percent of American adults online were using Twitter or analogous services. While that is an important amount, the vast majority of Internet users, not to mention people in general, are not using Twitter. Thus, Twitter users are just a sample and are probably a very biased one. In addition, another kind of bias permeates research: the tendency of researchers to report positive results while suppressing negative ones. These so-called conclusions from a few, selected positive experiments can be straightforwardly applied to any other conceivable scenario.

In short, the 2008 U.S. presidential elections could not have been accurately predicted from Twitter by applying the most common current methods, says Gayo-Avello so the problem with predicting the outcomes of these elections was not in the data collection. Instead, the problem occurred in minimizing the importance of bias in social media data and by ignoring how such data differs from the actual population. Until social media becomes regularly used by the vast majority of people, its users cannot be considered a representative sample, thus forecasts from such data will be of questionable value at best and incorrect in many cases.

Social media is not a representative and unbiased sample of the voting population: Some strata are underrepresented, whereas others are overrepresented in Twitter, and demographic bias should be acknowledged and predictions corrected on its basis, states Gayo-Avello. Simplistic sentiment analysis methods should be avoided, and political discourse is plagued with humor, double entendres, and sarcasm, and this makes determining political preference of users hard and inferring voting intention even harder; remember, one cannot consistently predict elections from Twitter.

Other scholars argue that information on Twitter can be aggregated in a meaningful way. Their results demonstrate that Twitter can be seen as a valid, real-time indicator of political

sentiment. Little research has yet been conducted in this area, leaving many questions unresolved. Further research should test whether text analysis procedures, which are more closely tailored to the political debate, reflecting both the specifics of microblogging and the political issues, can produce even more meaningful results. Researchers should also try to capture the context of a particular statement in a more comprehensive manner, including threads of conversation and links to information beyond the tweet.

Social Multimedia Patterns

Jin, Gallagher, Cao, Luo, and Han take a new path to explore the global trends and sentiments that can be drawn by analyzing the sharing patterns of uploaded and downloaded social multimedia. In a sense, each time an image or video is uploaded or viewed, it constitutes an implicit vote for (or against) the subject of the image. This vote carries along with it a rich set of associated data, including time and (often) location information. By aggregating such votes across millions of Internet users, social multimedia may demonstrate its usefulness in serving as an information platform for social science studies, such as politics, economics, and marketing.

They propose several Flickr features considering images, tags, and users for building prediction models and monitoring trends; they studied the 2008 U.S. presidential election and showed that Flickr provided hints that indicated the winners of the party presidential primaries and the presidential election. Based on Flickr features, they proposed the three new models (AR_Flickr, SAR_Flickr, and Bass_Flickr) to extend widely used traditional prediction models in economics and marketing. Experiments on popular products show that these models produce much better prediction performance, both in terms of lower error rate and higher robustness.

The forecaster, in formulating a model of election outcomes, should include variables that are well-measured proxies for individual voter decisions as they aggregate, and statistical modelers compete among themselves and with pollsters (and possibly other approaches) for the better forecasting instruments, scholar M. S. Lewis-Beck states. Questions to be answered are the same as elsewhere. Which forecasting instrument, from

which approach, has more accuracy, lead, parsimony, and reproducibility?

In the world of forecasting, close attention is needed. Forecast is news, and as such, the media may wish to manage it a bit. Says Lewis-Beck,

Once, in France, a leading conservative daily declined to publish the article they had commissioned from me, because they did not like its forecast of a Socialist win. It takes work to explain to them that the forecast comes out of the calculations in the model, not out of my own personal political calculations.

Foreign Policy

The rise of digital resources, particularly social media, has had a profound impact upon the practice of foreign policy, and has introduced a number of issues that influence the policies of nations in international affairs. New digital communication technologies have introduced a number of new foreign policy considerations, including issues that relate to state sovereignty, the rise of nonstate actors, and the possibilities of cyber warfare and increased surveillance. At the top of the list, however, are considerations as to the presumed democratization function of social media, global Internet governance, and issues related to state control of sensitive information, as embodied in the Julian Assange/WikiLeaks controversy.

Early analysis of the Internet focused attention on the supposed democratizing nature of the Internet, and particularly the advent of reciprocal, user-generated content. One of the first analysts to argue that electronic networks had a democratizing effect was Christopher Kedzie, who wrote as early as 1993 about the "dictator's dilemma," or the choice that repressive governments faced when creating information technology networks, which would spur economic growth, but also create space for public criticism of the regime. Kedzie argued that the reciprocity in e-mail, or the ability to respond to messages easily via the same medium and to the same audience created an inherent democratic virtue embedded within the technology, and that this ability to rapidly send out messages would play the same role in challenging nondemocratic states as other types of information had played in the former Soviet Union.

Later policymakers and analysts followed Kedzie's lead, although with a broader understanding of the development and potential of information technologies. U.S. Secretary of State Madeline Albright spoke of the difficulty in controlling information networks, using the metaphor of "nailing Jell-o to the wall" to illustrate the difficulties in controlling user-generated messages. This assumption carried through several U.S. administrations, including those of Bill Clinton, George W. Bush, and Barack Obama, although the technologies and capacities of social media continued to change. In fact, the U.S. government,

through a number of agencies, gave significant funding to spur technological innovation aimed at creating a safe space for Internet activists, particularly those from repressive regimes.

During Barack Obama's administration, the elevation of social media specifically continued as a focus of foreign policy. After she was named secretary of state, Hillary Clinton named Alec J. Ross as senior advisor for innovation. Ross spearheaded the 21st Century Statecraft initiative, which sought to adapt the practice and consequences of statecraft by deploying information technology in innovative applications. In addition to encouraging the adoption of social media in public outreach, Ross also advocated the development of new technological tools to meet a variety of political, developmental, and criminal problems. For example, Ross encouraged the leadership of Twitter to delay an upgrade scheduled immediately prior to the 2009 Iranian presidential election, which allowed Twitter users to use the service as a form of mass protest against the Iranian government.

Clinton's emphasis on social media took on two additional distinct dimensions that moved social media closer to the center of U.S. foreign policy. The first was further engaging social media for enhanced public outreach, particularly to foreign publics, or "digital diplomacy." The second, however, was Clinton's Internet Freedom initiative, which she articulated in a speech in early 2010. In her speech, Secretary Clinton argued that information technology networks were creating a "new nervous system" for the globe, in which information about global events is translated in real time around the world. As part of the policy, Clinton committed the United States to financing programs to further develop circumvention tools and training around the world for social media activists to skirt official governmental controls. Although freedom of information had long been a key plank of U.S. foreign policy, Clinton's extension of this to the specific technologies of social media committed the U.S. government, some argued, to a technological utopianism that was unrealistic.

Internet Governance

Because the Internet and social media rely on international electronic networks that are not

constrained by national borders, one critical foreign policy issue that arose around the development of the Internet was that of Internet governance, or the mechanisms and policies by which global technological networks are governed. This has created a significant foreign policy issue because governments and other organizations attempt to develop policies that give them a greater stake in the development and deployment of the Internet.

A number of nations argued that the United States' almost exclusive control over the technical structure of the network wasn't justified, given the global importance of the network. As a result, there were calls for alternative models for governance that would diminish the United States' role, expressed primarily through its control of the Internet Corporation for Assigned Names and Numbers (ICANN). Attempts to generate global consensus on Internet governance structures, however, led to little progress. In 2005, the United Nations sponsored the World Summit on Information Society (WSIS), and in a series of subsequent meetings, explored the possibility of developing alternative modes of governance, involving institutions such as the International Telecommunications Union. Ongoing disagreements over policy issues, such as whether Internet activists or nongovernmental organizations (NGOs) should be considered "stakeholders," for example, kept such a consensus from emerging.

Thus, there are a number of specific questions that emerge from concerns over global governance. For example, should NGOs be considered legitimate stakeholders, thus putting them at the level of nation-states issues of Internet governance? Should the UN assert some authority over the Internet, or should some global code of governance be developed, governing not just technical standards, but also allowable content? What sanctions should exist for states that undermine the laws of other states regarding the Internet? For example, U.S. attempts to create circumvention software that could be used by activists in nations such as Cuba, China, and Iran are viewed by those governments as illegitimate and encroaching upon espionage. Likewise, the United States encouraged the use of Twitter in the 2009 Iranian election and the 2011 Arab Spring movement to undermine existing governments.

Given this example, should other states also use social media to undermine other governments? Should commercial enterprises, such as ICANN, be able to maintain the technical control over networks, which in theory, would allow them to cause widespread disruption to networks in specific nations? Who should assume responsibility over international hacking, such as the alleged hacking of the U.S. Defense Department by Chinese military interests?

Control of Critical Information

A third critical foreign policy controversy that emerges from social media is that of crowdsourced social media formats that facilitate sensitive information, such as WikiLeaks. Although WikiLeaks is not the only such disruptive site, the issues raised by WikiLeaks illustrate the collision, at least in the United States and western Europe, between governmental commitment to an open Internet and social media networks, and the values of state secrecy. Although WikiLeaks had been releasing a variety of information, including corporate data, since its founding in 2006, it came to geopolitical importance with the release in 2010 of two sets of data: classified government and defense documents concerning the Afghan and Iraq wars, and later that year, U.S. State Department diplomatic cables.

These two releases led to immediate condemnation from the U.S. government, which argued that the release of the war documents might endanger operational security and ultimately aid the enemy, and that the release of the diplomatic cables might endanger innocent lives and embarrass numerous governments. One allegation is that the 2011 overthrow of the Tunisian government was attributable at least in part to the corruption documented by the cables. Later releases included information that was considered embarrassing to a variety of other governments, including Peru, Russia, Syria, as well as the private global intelligence consultant Stratfor.

U.S. Secretary of State Hillary Clinton promised to ensure that such a breach (as the U.S. diplomatic cables) would not happen again, and severely criticized the organization for endangering innocent people and sabotaging the peaceful relations between nations, vowing to punish those responsible. Although some argued that

Clinton's Internet Freedom agenda would support the rights of organizations such as WikiLeaks, she and the U.S. government saw no contradiction, and numerous commentators argued that her stand on Internet freedom was hypocritical. Arguments on the other side of the issue maintain that Clinton's reaction was consistent with the basic requirements of national security as it relates to the uncensored publication of sensitive and classified material characterizing the WikiLeaks incident. Perhaps more than anything else, the WikiLeaks episode illustrates the classic "double-edged sword" nature of the Internet in foreign affairs.

It was not just the U.S. government, however, that saw WikiLeaks as a threat and took action. Governments such as China, Australia, Iceland, and Thailand all reacted strongly to the organization, and Assange was charged with rape in Sweden, a charge that many considered to be politically motivated, and intended only to keep Assange in custody while the United States prepared prosecution on espionage charges. As of May 2013, the Assange case was unresolved. Controversies such as these highlight the policy issues associated with organizations such as WikiLeaks, which might be seen as a sort of crowdsourced intelligence agency. Another example occurred in early 2013, when North Korea was made aware of the visit of a U.S. aircraft carrier to South Korea by amateur photographers who posted the pictures of the carrier to online photo sites. Governments continue to seek solutions to maintaining state secrecy while encouraging technological diffusion. Social media's impact on foreign policy has also affected diplomatic practice.

Digital Diplomacy

Digital diplomacy is a term that has come to refer to the practice of governments to directly engage foreign publics using social media technologies. There are several key perceived advantages in developing digital diplomacy efforts. First, digital diplomacy provides a relatively cost-effective way to develop connections with foreign publics within tighter budget environments, and is certainly less expensive than traditional outreach mechanisms. Second, digital diplomacy also extends the reach of diplomatic staff, who can effectively engage larger publics than would traditionally be reached

through normal diplomatic channels. Digital diplomacy is typically considered a form of public diplomacy, which seeks to engage foreign publics, rather than just political elites within a nation. Finally, digital diplomacy allows diplomatic staff to better monitor public opinion toward a foreign government, political leaders, and policies, in ways similar to the manner in which corporations use social media to monitor public opinion.

Given how new digital diplomacy efforts are, there are few indicators of effectiveness beyond gross measurements of the activity of key officials and diplomats on social media platforms and the number of followers those officials garner. The practice of digital diplomacy typically involves two primary activities: policy communication and cultural connection with key foreign publics. One of the primary activities that embassies engaged in digital diplomacy undertake is the communication of governmental policy to communities of foreign publics beyond traditional audiences. This allows diplomats to effectively bypass the gatekeeping function of host governments, press outlets, or other elites. Depending upon the platform used, this can range from tweeting key quotes from administration officials to videos of policy statements posted on platforms such as YouTube. This can be a valuable way to help contextualize key moments, such as state visits or question-and-answer sessions via Web chats to ambassadors or other key actors. This might be particularly useful in situations where a host government would openly oppose a nation's policies and limit the ability of diplomatic staff to adequately explain them.

Fostering cultural understanding is a second focus of digital diplomacy practices, and it is ideally suited to social media. Following the line of traditional public diplomacy activities, digital diplomacy is also concerned with enhancing the appeal of one's culture to foreign publics. For example, Australian engagement with Indonesia on Facebook has highlighted collaboration between the two nations on key health initiatives. Cultural exchange works in the reverse as well, with descriptions of topics that are popular and relevant to local followers featured on social media platforms. Exchange takes place digitally, eliciting participation from members of the community. For example, the United Kingdom (UK)

targeted Somalis in the UK and the Somali diaspora to follow and comment on the London Conference on Somalia via Storify and other social media platforms. In following topical trends of social media, posts are also outside of the policy or cultural exchange realms, featuring unrelated, fun topics.

With the rise in prominence of digital diplomacy practices, one consistent struggle that states have encountered is that of guaranteeing consistency of message. A tenet of diplomacy is the consistency of messaging released from the top of the organization, senior level leadership (e.g., ambassadors), and lower-level staff. Doing so in a coordinated fashion has been a fundamental part of the discussion of how social media is incorporated into public diplomacy because the technologies introduce greater potential for "rogue messaging," or inconsistent messages to foreign publics via social media. States have begun to create policies on control of information for both official governmental accounts and personal accounts. These policies typically involve parameters for what types of information can be posted without approval, and the types of information that should be posted in consultation with embassy leadership. Still, discretion is often left to the embassy in the posting of content. Policies will likely continue to evolve because there have been instances in which embassies have posted content that violate unwritten rules concerning digital diplomatic engagement. For example, before, during, and after the September 11, 2012, attacks on U.S. facilities in Benghazi and Cairo, diplomatic officers in Cairo tweeted and posted to the embassy Facebook page a series of messages out of step with broader organizational narrative about the attack, leading to significant criticism of the individual staffers and the Department of State.

National Exemplars

The United States has spearheaded digital diplomacy efforts, both through the creation of unique Web 2.0 platforms such as Exchanges Connect, and through traditional platforms such as Twitter and Facebook. Similar to Facebook's interface, Exchanges Connect was designed to connect potential participants in U.S.-coordinated cultural exchange programs around the world. Initially, the State Department encouraged each embassy

to devote equal attention to creating virtual communities across all of the dominant social media platforms. Increasingly, each embassy tailors its digital diplomacy strategy to the particularities of Internet access in the region in which it seeks to create engagement. For example, the Internet is accessed in Southeast Asia primarily through mobile phones, thus embassies in the region focus digital diplomacy efforts more on Twitter than on Facebook, which is more difficult to access on mobile phones in the area.

One interesting example of digital diplomacy was the development of Virtual Presence Posts (VPPs) by the U.S. State Department to provide a low, but formal level of diplomatic engagement with regions that could not be served by a physical location, such as an embassy or consulate. For example, the Beijing Embassy staff developed VPPs for important Chinese cities where it was impractical to establish consulates, but still wanted to be able to engage the public of those cities on issues regarding U.S. policy. Other VPPs were developed to provide an outreach to countries where there was no U.S. embassy, or to provide information for other U.S. government agencies working in a region. Many of these VPPs were originally developed on Facebook, but were moved to servers maintained by the State Department, probably because these efforts have been reclassified as e-diplomacy.

Other nations have followed suit in initiatives toward online diplomacy, using similar formats. The United Kingdom has engaged in digital diplomacy efforts designed to connect with specific publics of interest, focusing for example on Chinese publics in the UK and in China through extensive use of the Chinese messaging service Weibo because Facebook and Twitter are currently blocked within China. Russia has also begun to invest time into the creation of a robust digital diplomacy campaign, reclaiming the term and calling it “innovative diplomacy.” Though engaged extensively with soft power efforts on other media platforms, China has not adopted online diplomacy to the same extent that other nations have.

A number of smaller states have developed significant digital diplomacy initiatives in an attempt to gain more geopolitical influence, such as Kuwait, Israel, and Singapore. One particular

initiative is that of the Israeli government, which has engaged in social media efforts to make government-to-people connections to improve Israel's image within the international community and bypass institutions such as the United Nations.

In order to capture the real-time dynamics and change inherent in digital diplomacy efforts, the AFP created an e-diplomacy hub, including rankings of relative influence and current issues under discussion via social media. As of May 2013, the United States' influence far exceeded that of other nations, with approximately 68 million followers of an index of officials and experts. Other nations demonstrating significant influence were Turkey, Egypt, and Saudi Arabia, each with between 15 and 17 million followers.

Although the term is often used in place of digital diplomacy, “e-diplomacy” has been conceptualized differently by the United States and other diplomatic communities. Whereas digital diplomacy initiatives are targeted toward foreign publics, e-diplomacy efforts are focused on using digital communication technologies to improve the daily workflow of diplomatic officers. Although e-diplomacy initiatives rely more on in-house platforms and servers designed to improve knowledge management within foreign ministries, there are also significant social media dimensions to these efforts. These initiatives facilitate knowledge sharing (e.g., Diplopedia, the U.S. State Department's internal wiki), aggregate complex consular information in easy-to-access interfaces, and encourage diplomats to create blogs to share ideas and spark discussion with diplomats stationed around the world.

Foursquare

Foursquare is a location-based social media service that allows registered users to check into venues by selecting from a list of global positioning system (GPS)-generated locations within close proximity of a mobile device. In November 2012, Foursquare reported that more than 25 million people worldwide were part of its user community. Founded in 2007, it now has had more than 2.5 billion check-ins. The primary use of Foursquare is to check in and share location and opinion information about specific venues. It is also used for collection of points, prize badges, and coupons or discounts at businesses. Users can create to-do lists for their private use and add tips for other users regarding specific venues or locations. Users can also browse their check-in histories, which categorize visits by month, year, and other users they were with at the time.

Incentives for Using Foursquare

Foursquare has two strategies for encouraging users to check in. The first strategy is directly related to financial revenue (that is, the company partners with businesses to offer users coupons and specials for checking in and sharing information with their friends). For example, using the Foursquare app, a user might see that, if she or he selects Chili's for lunch and uses Foursquare to check in, free chips and salsa will be provided. Likewise, companies like JC Penney's offer their Foursquare customers discounts on merchandise for a certain number of check-ins. In addition, some check-ins are fund-raiser related and result in funds raised for local charities. Foursquare has effectively leveraged the power of local advertising with regard to the intersection of customer interests and their readiness to purchase based on physical location.

Foursquare also offers incentives related to the collection of points, prize badges, and "mayorships." Points are accumulated each time a user checks in to a new place; they earn from one to five points. All points expire every Sunday at 11:59 P.M., so users can challenge each other to get more points within a week's timeframe.

Badges are also earned by checking into various venues and serve as milestones for multiple check-ins using Foursquare. For example, you can earn your Gym Rat badge for checking into the gym at least 10 times in a 30-day period. The BFF (best friends forever) badge is earned when a user checks in 10 times to any location with the same person. The Swarm badge is earned when a user checks in with at least 50 other people at a location. This badge is one of the most challenging badges to obtain because the user has to have at least 50 people checking in at the same location at the same time. Swarm badges can be obtained by organizing a Swarm badge party focused on a common cause, issue, or politics. A SuperSwarm badge party incorporates 250 or more people. These badges are displayed on the user's profile to enable others to know how many places the user visited.

A mayorship is awarded to a user who has checked into a venue on more days than anyone else in the previous 60 days. The mayor receives a badge to commemorate his or her achievement, and this badge is displayed on the user's page. In addition to the badge, if the users have their Twitter profiles linked to Foursquare, then both users will receive a message stating that one person has been ousted as mayor. Another user can take away a mayorship by checking in more times than the previous mayor. This mechanism has been used as a way to promote businesses and events by giving people an incentive to check in as often as possible. Some businesses like Pei Wei restaurant offer free meals for their mayors.

Foursquare and Politics

Political candidates at the local, state, regional, and national level use Foursquare to check in during their campaigns. On a local level, some politicians leave tips for others on discussion boards at various places in their jurisdictions. Some tips from local politicians usually include compliments for local merchants or items in their shops, along with the politicians' positions (for

Foursquare pins, some modeled on the online badges users earn, being given away along with temporary tattoos at the SXSW 2010 gathering in Austin, Texas.

example, candidate for state senate in District 1). In addition to posting tips, some local political candidates use social media to tell others about the neighborhood where they personally canvass. Some politicians choose to post the names of the neighborhoods instead of the actual street names. Other politicians choose to post follow-that-candidate maps to let others know about their physical positions and how they are traveling to their future positions. This might be important to the candidates' constituents, supporters, and the press. When politicians are elected to office, some choose to maintain connections with their constituents through Foursquare by letting them know about town-hall meetings, conferences, or fund-raising events.

Foursquare Voting App

In addition, through Foursquare, the public is provided with opportunities to participate with one another in real time through a voting app. On Election Day, users can use <http://election.foursquare.com/> to gain an "I Voted" badge and join the other

Foursquare users in a real-time voting display. Through this app, users discover the locations of their local polling places and learn about the candidates and their political positions on the ballot, potential forms of identification needed for voting, and new or revised requirements for voting. This Foursquare-based app was formed in a partnership between the Pew Center for the State, Voting Information Project, and Google.com.

2012 Presidential Election

During the 2012 presidential election, NBC Politics added three new badges to the Foursquare collection: Political Wonk (one check-in), Campaign Advisor (two check-ins), and Chief of Staff (three check-ins). To earn one of these badges, users had to follow NBC Politics on Foursquare and check into political landmarks, debate halls, and campaign hot spots. During time spent at the hot spots, users had to complete tasks, like saying the word *vote* out loud, to gain a badge. The locations ranged from the Tampa Bay Times Forum and Hofstra University to Palm Beach County Convention Center and University of North Carolina at Chapel Hill. At each location, NBC Politics left tips for the visiting users. Most locations featured photos about the significance of the location to either the Republican or Democratic parties.

Another prominent Foursquare partnership exists between the organization and *Time* magazine. During each political convention, *Time* provided the attendees an opportunity to gain access to unique *Time*-based Foursquare badges after checking in at the convention venue and surrounding venues. Convention attendees and followers of *Time* gained access to a list of must-attend events and a list of event-related tips from the team members from the *Time* political reporting team. In addition to check-in tips, convention attendees also gained access to timely updates from reporters and others as they checked in on Foursquare. This method helped to contribute to social presence among in-person convention attendees and virtual attendees.

Framing Theory, Social Media and

Framing is the process of selecting, organizing, and editing information for distribution through a medium. Framing theory is based on the idea that how information is presented can influence the way an audience perceives, interprets, and reacts to it. Traditionally, framing theory refers to the way the news media organizes a news story, but starting in the 2000s, the idea was expanded to include the way that information and opinions are presented by users in social networks. Framing theory is important in the realm of social media and politics because the way information is presented influences public opinion and knowledge.

Framing theory is based on the idea of issue salience and priming, concepts described by Maxwell E. McCombs and Donald Shaws’s work on the mass media and agenda setting. Issue salience and priming suggests that the public’s knowledge and perception of a topic’s importance is influenced by the media’s treatment of that topic. For example, a news story that appears on the front page of a newspaper or a story that receives the most space or time in a news broadcast is generally of greater importance than the rest of news content in that publication. Framing is the

process of the news outlet deciding what stories should receive the most attention, and what stories should be minimized or left out.

Framing is often called a theory of media effects because of the constructed information’s influence on a reader. Dietram A. Sheufele argues that media frames influence public opinion through telling the viewer what topics are important and what they should know about each topic. Frames serve as independent variables, meaning that they exert influence on the opinions and knowledge of the audience. Further, because the news media is often one of the only sources the public has on many topics, the way information is presented in the media is a primary contributor to the public’s awareness. This gives the news media a powerful role in influencing public opinion.

William Gamson and Andre Modigliani investigate the institutional approach to framing theory, advocating that the presentation of information requires the source to engage in frame building. Rather than focus on issue salience, frame building requires the consideration of how a message is constructed. When analyzing the way information is framed, a researcher can consider the way frames are built, such as the types of language, tone, and evidence used to convey information. Robert Entman argues that framing analysis should have four goals. First, researchers should identify the frames throughout a publication. Second, researchers should study the institutional conditions that produce frames. Third, researchers should look at how the audience or reader interacts with the frames. Finally, researchers should look at how frames affect public opinion or policy.

David Russell Brake studies the way that social media users frame online postings in Web 2.0 technology such as blogs, Facebook, and Twitter. He has found that bloggers frame topics very similarly to news organizations, designing messages by tailoring them to appeal to specific audiences. Topics written about most frequently or given the most space are deemed by readers of more importance. Additionally, bloggers design messages to convey a specific tone by using language, examples (including images and video), or metaphors. Readers who see information presented similarly across many blogs are most likely to adopt a similar orientation to a topic.

Jackie M. Street and colleagues emphasize that frames are most powerful and exert the most influence on the audience when they are repeated across many sources. In social media or Web 2.0 commercial media outputs, topics are deemed the most important when they are discussed by many participants. Further, when a topic is similarly framed by many participants, onlookers are most likely to adopt similar frames. The scholars suggest this is because of the illusion of congruency and consensus generated when a topic is addressed by many people in a similar way. Onlookers will adopt prevalent attitudes surrounding the topic because of the perceived popularity of the frame.

Shannon L. Bishard's study of John Kerry and President George W. Bush campaigns' framing of issues on official blogs found that consistency is vital in social media and Web 2.0 strategy. Over time, candidates strive to consistently frame issues with their platforms, recent speeches, and debate performances. The study also concludes that the majority of content framed on candidates' Web sites and official blogs focus on current issues, rather than on the past or future. Similarly, the study's conclusions also demonstrate the use of framing to create the illusion of closeness between the candidate and the reader. Postings are framed as personal communication, using words such as a "you." Because of the frequency of this tactic, Bishard concludes that this is an important element to both candidates' social media strategy.

Sharon Meraz and Zizi Papacharissi examined tweet frames during the Egyptian uprisings in 2011. The study found evidence of networked framing, or the negotiation of frames between cultural gatekeepers (those who produce an original tweet) and the public (those who retweet content produced by gatekeepers). While gatekeepers framed the events of the Egyptian protests using many frames, the public tended to only retweet content that was consistent with framing the protests as a citizen uprising of righteous protesters. The study reveals that frame negotiation exists in social media between gatekeepers and the public. While gatekeepers create the frames, the public decides which frames become popular and well known.

Franken, Al

In 2008, former *Saturday Night Live* writer and performer Al Franken narrowly defeated incumbent Norm Coleman for Minnesota's second seat in the U.S. Senate. Coleman triumphed in 2002 when his opponent, popular two-term Minnesota progressive Paul Wellstone, unexpectedly died in a plane crash right before the election. Concerned about being taken as an erstwhile politician, Franken, like Wellstone before him, campaigned on worker and consumer rights. Franken's brief tenure in the U.S. Senate is notable for his involvement with social media and privacy issues while serving as chair on the Privacy, Technology, and the Law Subcommittee of the Senate Judiciary Committee. What is perhaps most noteworthy about Franken's involvement with social media is not how he uses them to promote his celebrity backstory. In fact, Franken does not cultivate a following by force of personality, much like fellow Minnesotan politician Michele Bachmann. Franken does not even personally post to or update his Twitter and Facebook accounts. Among social

media scholars, Franken is best regarded for the innovative way he used social media platforms to target and mobilize voters during his Senate election campaign.

Democratic strategist and social media advisor Natch Greyes observes that too often political campaigns fail to effectively target niche audiences through social media. Instead, campaigns overlook social media's ability to target and interact with micro-audiences, and instead try to import one-way messaging strategies typical of telephones, e-mail, and snail mail communication onto social media platforms. Social media users are not a mass, undifferentiated audience. Greyes points out that social media users who follow political campaigns and elected officials are accustomed to receiving personalized communications, not impersonal messages addressed to a wide audience. Such broad messages—common to expensive radio and television spots—are expensive and offer diminishing returns. In part because he lacked the resources available to an incumbent, and because he was not a fixture of the Minnesota Democratic Farmer Labor Party, a state affiliate of the Democratic Party, Franken needed to employ a highly efficient means of targeting voters. Franken's team calculated that the best way to target voters was by issue, not by demographic. The key for the Franken campaign was not to form new networks, or coalitions of likely voters, but instead to tap into existing online networks formed around particular issues that overlapped—or could be made to appear to overlap—with Franken's overall message and campaign theme.

Long-Tail Nano-Targeting

New media advertising expert and Franken campaign consultant Josh Koster termed Franken's strategy "long-tail nano-targeting." The Franken campaign strategically advertised using Google AdSense in order to target many online groups—or niches—instead of broadcasting a large campaign ad targeting a general, unknown, unidimensional audience. These advertisements targeted users based on keywords in their Google searches. The Franken campaign bought certain keywords—words and names—and when users searched for those words or names, their searches triggered an associated Franken ad. Greyes explains that

Minnesotans who searched for information on gas prices or hybrid cars encountered ads detailing Franken's plan for lowering gas prices. Franken's campaign identified several keywords that might be used by Minnesotans in order to strategically place advertisements outlining Franken's specific plan regarding that issue. In this way, the Franken campaign tapped into existing niche audiences that shared an identity around a particular social or political concern. Greyes notes how an online niche audience tends to circulate a candidate's message to friends and allies on other new media sites. In a nutshell, nano-targeting relies upon a successfully targeted, small-niche audience to do the work of reaching increasingly larger targets through recirculation of a strategic campaign message.

Not only is nano-targeting highly effective at using social media platforms to help circulate a message, but it is significantly cheaper than advertising through direct-mail campaigns, television, or radio. Though digital advertising that relies upon social media will not replace effective television ads, it will likely continue to serve as a powerful tool for campaigns that need to strategically manage resources to compete with traditional media advertising. Josh Koster notes that Franken's Google search strategy (which was only a part of his campaign's larger social media nano-targeting strategy) cost the campaign less than \$20,000 for 20,000 individuals to read campaign literature, more than 5,000 to join a campaign e-mail list, and more than 2,000 individuals to donate directly to the campaign. The return on investment, reports Koster, was "staggering."

Franken's long-tail strategy worked because an Internet audience is highly fragmented. Nano-targeting works to collect small niches into a larger coalition. Koster observes that "universally persuasive" messages do not resonate like they used to with audiences familiar with digital and social media. In this way, it is difficult and inefficient to target a wide audience. The long-tail strategy focuses on isolating issues and nano-targeting them to the right online niche that already has formed a small coalition around the issue. Franken's strategy linked those values, positions, and commitments that already inhabited a niche and invited those nano-targets to identify their commitments with his campaign. Franken did not

build a coalition so much as he sutured very small coalitions together through digital and social media targeting practices.

Koster explains that Franken's strategy involved identifying and targeting two different kinds of niches: persuasion and acquisition. When targeting a persuasion niche, a campaign team identifies the most persuasive content they have available, such as video of a key endorsement, a carefully choreographed image or tableau, or a supportive news article, and then try to determine who might be persuaded by that content. Koster notes that potential voters who searched for a particular union or a particular newspaper would trigger an ad reflecting content directly related to the search. Franken's campaign generated keywords that people might enter and that could be easily linked to targeted content. The campaign carefully monitored which keywords were the most popular and accordingly updated and bolstered their content.

In addition to targeting persuasion niches, Franken's campaign also appealed to acquisition niches. Campaigns target acquisition niches by identifying the types of voters they want to recruit and trying to locate them in the virtual world of digital and social media. If campaigns target persuasion niches to bring content to particular voters, they reverse course when targeting acquisition niches. According to Koster, Franken wanted to target skeptical Democratic donors, activists, and college students. By "advertising to the long tail," Franken's campaign extended their possible donor and voter base. Anyone on Twitter who used topical liberal hashtags—a word, acronym, or abbreviation included at the end of a tweet to signal its topic—is a relatively easy target for a Democratic candidate. Twitter users use hashtags to indicate niche affiliation. This allows campaigns to target donors from outside the contested district to contribute campaign funds. Franken's campaign piggybacked off the Obama campaign inasmuch as they parsed key staff members associated with Obama and linked their ads to those names in Google and Gmail, its affiliated e-mail service. With long-tail nano-targeting, it is easy to measure where audiences are accessing content and which keywords are triggering those exposures. It is more difficult to measure how many and to what extent nano-targeted voters then recirculate campaign content. What

is known, however, is that the long-tail strategy relies as much on targeting as it does on targets subsequently targeting other potentially allied voters within their already-formed networks. With this strategy, Franken assembled a large-enough coalition to win a tightly contested Senate seat, initially by less than 400 votes.

Online Privacy

Franken's focus in his first term in the Senate has been on consumer advocacy, especially on the issue of consumer privacy and control over user-submitted online content on social media sites. Facial recognition technology is an issue that has caught the attention of Franken in his role as chair of the Privacy, Technology, and Law Subcommittee. In a committee hearing named "What Facial Recognition Technology Means for Privacy and Civil Liberties," Franken, well established as a critic of Facebook privacy policies, led the Senate committee members in questioning Facebook privacy manager Rob Sherman about the potential issues of facial recognition software. Franken brought to light the issue of Facebook's privacy settings document, which he claimed, makes it difficult to opt out of facial recognition. Facebook's facial recognition technology recommends the identities of people who a user has classified as a friend in a photo. Facebook's competitor, Google Plus, has their facial recognition turned off by default. Users have to voluntarily elect to have a faceprint made of themselves, whereas Facebook automatically generates faceprints.

Jeffrey Rosen has noted that Franken's public concern with Facebook and user privacy is timely because it draws attention to how difficult facial recognition technology makes reputation management in a digital age. Rosen notes how Facebook permits applications that employ facial recognition software to allow a user to locate any photo of him- or herself or a friend, regardless of whether that photo was tagged by the user. Rosen points out that people will be able to record video or photos of anyone, run them through Google, and in so doing, access all the photos that exist of the person on the Web. In part because of the negative attention gained during Franken's committee hearing, Facebook soon after amended its privacy policy, making it simpler and easier to navigate.

Franken's questioning of Sherman, in addition to his interrogation of law enforcement leaders and an FBI director, brought attention to the issue of how facial recognition software might lead to unwanted violations of privacy and civil liberties by making it easy for political organizations, law enforcement agencies, and even stalkers to use facial recognition to access personal information like a user's address, friends, and affiliated groups on social media sites. Kashmir Hill notes that Franken's questioning brought up key free speech questions regarding whether police could use facial recognition technology to identify people involved in protests or rallies, despite pledges to only maintain databases of mug shots of known criminals.

Franken has also established himself as a consumer advocate concerned with protecting online consumers from businesses that want to market their personal data. To this effect, Franken helped stop a partnership between popular video streaming Web site Netflix and Facebook in early 2012. The two media companies wanted to be able to share user data, but are legally unable to do so because of the Video Privacy Protection Act that requires a video company to gain a customer's written consent in order to share that client's personal information. Franken noted that the proposed bill to permit consumers to give a one-time blanket permission for a video company to share their information (presently a user needs to give written approval) weakens consumers' ability to control information collected about them, even as it enables companies' increased access to consumer information, viewing habits, and so on. Though music-streaming services can partner with Facebook, video services cannot. At issue are a user's viewing habits, which some privacy advocates argue reveal more about a person's personality, sexuality, and values than music or any other media form. As a result of Franken's and other committee members' privacy stance, the United States remains the only country in which Netflix cannot share user data with Facebook.

Franken is noteworthy for his defense of net neutrality, the notion that service providers should not be able to privilege the accessing of certain content over others. Somewhat controversially, Franken supported the Protecting Real Online Threats to Economic Creativity and Theft

A screenshot of Al Franken's 2008 Senate campaign Web site. Franken used innovative methods to build a base of supporters, including long-tail nano-targeting. In the Senate he has acted as both a consumer advocate and online privacy advocate.

of Intellectual Property Act (PIPA) as a way to protect creative copyright and curtail infringed content like bootlegged movies and software. It is not surprising that Franken, a former comedian and author, supported legislation to protect creative copyright. Franken addressed his progressive skeptics by noting that much union labor goes into the production of creative properties, and that data that infringes on the copyrights of those creative properties must be prevented from circulating freely and openly on the Web. Franken insisted that protections for intellectual property offered by PIPA protect millions of jobs. The point of PIPA, he contended, was not to protect corporate influence, but to preserve American creative labor from piracy. PIPA, and its House version, the Stop Online Piracy Act (SOPA), were relatively obscure until the blogosphere and the social media world caught wind of them. Franken noted that most of his Minnesota constituents who contacted him did so through social media sites like Twitter and Facebook. Consideration for both PIPA and SOPA was suspended due to outcry from Web advocates concerned about how each might threaten net neutrality.

Franken's cutting-edge election strategy minimized costs while successfully nano-targeting niches through digital and social media in ways never before attempted. It is noteworthy that

Franken, after relying so heavily on social media strategies to get elected, would be one of its greatest critics—at least of Facebook and its privacy policies—as subcommittee chair in the Senate. The implied Franken ideal—empowering media users while limiting social media’s ability to undetectably exploit user data—suggests a grassroots, user-centric model of using social media for social and political expression.

Freedom of the Press and National Security

The First Amendment to the U.S. Constitution guarantees that the press has the right to operate without government interference. However, in wartime, there are often calls by both elected officials and the public to suppress the publication of information that may damage national security endeavors. Generally, U.S. courts have broadly interpreted the First Amendment, rejecting the ability of the government to restrict the press in wartime. At times, national security and press freedom come into conflict. The First Amendment guarantees that the U.S. government

may not limit political speech. It holds that “Congress shall make no law . . . abridging the freedom of speech, or of the press.” In the view of the founders, the press would serve as an additional check on elected officials, promoting transparency and accountability.

The First Amendment has resulted in two types of legal protections for the press. First, courts have generally granted journalists broad freedom to publish information on foreign and security policy, even if the government deems that information a threat to national security. With the exception of different levels of legal action against journalists occurring during times of war, or relative to espionage, sedition, terrorism, or treasonous acts or affiliations, since the post-Reconstruction era, no American journalist or news organization has been criminally prosecuted for publishing government information on national security policy. Moreover, courts have rejected government demands for permanent injunctions to prevent the publication of news stories that may damage national security; this is termed “prior restraint.” In such cases, courts have put the burden of proof on the U.S. government, requiring officials to identify a “compelling interest” in stopping publication, and further demonstrate that the restriction is “narrowly tailored” to advance that interest, without unduly compromising freedom of the press.

In addition to protections for members of the press, sources for news stories have generally enjoyed protection from criminal prosecution. As legal scholar Jonathan Peters notes, there is no one law that makes it a criminal act to disclose or disseminate classified information, although there have been sporadic government attempts to implement criminal punishments for leaking information. The 1917 Espionage Act represents the clearest legislative attempt at this; passed in the run-up to U.S. participation in World War I, the broadly worded act made it a crime to disseminate information that could harm U.S. security or aid U.S. enemies.

Despite the ostensibly broad scope of the Espionage Act, the government has only successfully prosecuted a handful of leakers; in addition, the government has declined to prosecute any journalists, even though the act makes it a criminal offense to receive classified information. Although it remains theoretically possible for the

government to pass and enforce additional laws punishing both journalists and their sources, there has been little sustained effort by elected officials in this area.

Pentagon Papers Case

The dispute over the *New York Times* publication of classified information about the Vietnam War led to one of the most famous Supreme Court cases on press freedom. The conflict began when Daniel Ellsberg, a researcher at the RAND Corporation, gained access to a top-secret report commissioned by former Defense Secretary Robert McNamara in 1967; the 47-volume report was titled *History of U.S. Decisionmaking on Vietnam Policy*. Although Ellsberg had been a supporter of the war, he became disillusioned with the conflict, and decided to publically release the papers in an attempt to expose the misperceptions characterizing past Vietnam policy. After photocopying and smuggling the report out of his office, he turned the report over to the *Times*; in June 1971, the paper used the nearly 4,000 pages of documents as source material for a series of front-page stories about past Vietnam policy.

Although the news stories did not contain any classified information about the Nixon administration's policy, and did not disclose any ongoing military actions, after the first story appeared on June 13, Nixon's Justice Department requested that the paper terminate publication of the article series. When the *Times* refused, the attorney general obtained an injunction from a district court to prevent the publication of any additional articles that were sourced from the Pentagon papers. The *Times*, along with the *Washington Post*, challenged the district court's decision, appealing to the Supreme Court. The core issue in the case was prior restraint, with the administration asserting that the publication of additional stories would cause damage to U.S. security interests. The *Times* countered by arguing that the Pentagon papers provided a valuable contribution to the ongoing public debate about the Vietnam War.

On June 30, 1971, the Supreme Court handed down the decision in *New York Times v. United States*. By a vote of 6 to 3, the justices held that the *Times* had the right to publish the information, and that the government had failed to make the

case for prior restraint. The justices noted that the government had not established any evidence of concrete harm to U.S. security interests. Ellsberg and another individual who assisted him, however, were charged under the Espionage Act; the charges were eventually dismissed. Nixon's subsequent attempts to discredit Ellsberg, including breaking into his psychiatrist's office, were a component of the Watergate scandal, which resulted in Nixon's resignation in 1974.

***Progressive* and the H-Bomb**

In the wake of the Pentagon papers case, the decision by a Wisconsin-based magazine to publish a controversial story on thermonuclear weapons led to a second case of a court injunction against the publication of national security information. In April 1979, the *Progressive*, a small left-wing publication, gathered enough publically available information to provide a detailed overview of the construction of a hydrogen bomb; at the time, only five countries possessed the weapon. All of the information had been obtained legally, and was supplemented by expert interviews. The magazine took an antinuclear stance; in publishing the story, the *Progressive's* editors hoped to spur public debate about the necessity of thermonuclear weapons.

In a bid to generate interest in the story, prior to publication, the editors of the *Progressive* sent a copy to the Department of Energy; subsequently, the U.S. government requested that the magazine halt publication until any classified information could be excised from the story. The government relied on the 1954 Atomic Energy Act; this act contained a clause making it a crime to receive and publish any information about the construction of a nuclear weapon. The *Progressive*, however, refused to stop publication; at the request of the Carter administration, a Wisconsin judge granted an injunction against publication, citing the dire consequences of nuclear proliferation. In this instance, although the government asserted that publication of the story would aid U.S. enemies in gaining a thermonuclear weapon, the magazine countered that all of the source material was already publically available, and thus the injunction was invalid. The government dropped the case after another news outlet published the information.

***Washington Post* and Ivy Bells**

Although the relationship between the government and the press is often seen as adversarial, there are instances when journalists have voluntarily refrained from publishing stories in the name of the national security. One such instance occurred in the early 1980s, when Bob Woodward, one of the *Washington Post* reporters responsible for breaking the Watergate scandal, gained information on a secret government intelligence-gathering program dating from the 1970s. The program was code named Ivy Bells, and was designed to tap undersea Soviet communication cables.

Initially, Woodward and his editor, Ben Bradlee, decided not to publish the story, fearing that publication would jeopardize an important intelligence-gathering operation. In 1986, however, Woodward learned that the Soviets had discovered and disabled the program in 1981. At this point, the *Post* informed the Reagan administration that it would proceed with publication.

The paper encountered strong resistance from top Reagan officials, who offered an array of arguments against disclosing the now-defunct program. In an effort to assuage the government, Woodward and his editors had more than 20 conversations with Reagan officials; moreover, multiple officials, including the National Security Agency (NSA) director, the secretary of state, and secretary of defense, reviewed a draft of the article. Prior to publication, Reagan contacted Katherine Graham, the CEO of the *Post*, and implored her to stop publication. Ultimately, in the midst of these deliberations, on 21 May 1986, NBC aired a report on the Ivy Bells operation, and the *Post* published its story soon after.

***New York Times* and the War on Terror**

Tensions between the press and the government continued during the U.S. War on Terror. Most notably, the *New York Times* and the George W. Bush administration came into conflict on two separate occasions, with the paper rejecting the administration's requests to withhold stories about clandestine antiterror programs. The first conflict occurred in 2005, when two reporters at the paper, James Risen and Eric Lichtblau, gained information about a NSA program that allowed the government to wiretap U.S. citizens without

judicial oversight. The program was implemented by executive order and was designed to circumvent existing federal laws prohibiting the government from monitoring phone conversations inside the United States. Risen and Lichtblau also discovered that the implementation of the program had provoked intense debate inside the Bush administration, with several top legal advisors questioning the constitutionality of domestic wiretapping.

Prior to publication, Lichtblau and his editor, Bill Keller, met with White House officials, who attempted to dissuade them from publishing the story. Members of the administration cautioned that if the *Times* exposed the program, the administration would have to terminate a valuable intelligence-gathering operation. Although the paper held back the story for more than a year, eventually Keller decided to publish the piece; it appeared on the front page on December 16, 2005. In 2006, Risen and Lichtblau received a Pulitzer Prize for the story. The second dispute occurred in 2006. At this point, Risen and Lichtblau discovered the existence of the SWIFT Banking Program, developed jointly by the CIA and the Department of Treasury. The program monitored international banking transactions through a Brussels-based clearinghouse in an effort to detect and terminate funding sources for Al Qaeda.

For several months prior to publication, the Bush administration lobbied the *Times* to withhold the story. In conversations with the *Times*, the administration argued that the program had resulted in the successful detection of funding for terrorism, and if disclosed, would become ineffective. Keller did not believe the program was illegal because it enjoyed congressional oversight; he asserted, however, that the public's right to know about this expansion of executive power justified the *Times*' decision to publish. On April 22, 2006, the story appeared on the front page of the paper. The reaction from elected officials was overwhelmingly negative; the president and vice president publicly castigated the paper for disclosing the program, and the House of Representatives passed a condemnatory resolution.

WikiLeaks

In 2010, the Web site WikiLeaks released more than 400,000 classified U.S. national security

documents. The ensuing debate over the release raised many questions about freedom of the press in an age when the Internet has changed the nature and boundaries of journalism.

Julian Assange, an Australian national with a background in computer programming, founded WikiLeaks in 2006. Assange's stated goal was to use the site to publish classified material in order to promote transparency in government. During its first years, WikiLeaks released a variety of documents, even garnering an award from Amnesty International for disclosing extrajudicial killings by the Kenyan government. Beginning in 2010, WikiLeaks engaged in the dissemination of controversial material on U.S. national security; this included a classified video and the release of several caches of documents. This information was obtained from Private Bradley Manning, a U.S. Army intelligence analyst who held top secret security clearance.

In April, WikiLeaks posted a video titled *Collateral Murder*; it showed several individuals, including Reuters journalists, being killed in 2007 airstrikes in Baghdad. In July, Assange released 77,000 documents on the war in Afghanistan, granting exclusive access to the *New York Times*, *Der Spiegel*, and the *Guardian*. Subsequently, WikiLeaks released more than 400,000 documents on the Iraq war. Finally, in November 2010, WikiLeaks released more than 250,000 cables transmitted from U.S. embassies. The U.S. government's reaction to the final release was overwhelmingly negative. Vice President Biden and Secretary of State Clinton claimed that the release of the cables undermined U.S. alliances. Members of Congress initiated hearings, and several Senators proposed the Securing Human Intelligence and Enforcing Lawful Dissemination (Shield) Act; this act would amend the Espionage Act, criminalizing not just the leaking of information gained from human intelligence, but also the publication of it.

Although the Justice Department initiated an investigation, Assange has not been charged with any criminal offense. He is, however, facing extradition to Sweden on sexual assault charges. Assange claims that the charges are politically motivated, and in 2012, the Ecuadorian government granted him political asylum; he currently resides inside the Ecuadorian embassy in London.

Julian Assange preparing to deliver a statement on August 19, 2012, from a balcony in the Ecuadorian embassy in London where he has been allowed to stay to avoid extradition.

For his part in releasing the documents, Manning was charged with multiple offenses under the Espionage Act and the Uniform Code of Military Justice. In February 2013, he pled guilty to 10 of the 22 charges against him; he is awaiting trial.

Although the relationship between the press and the government is inherently conflictual, when national security interests are involved, both sides face a complex set of calculations. Despite the fact that many members of the media take an absolutist view of the First Amendment, the historical record demonstrates that journalists are acutely aware of the potential consequences of publishing classified national security information. As such, decisions to publish stories sourced from classified material are often preceded by months of deliberation, with members of the press actively consulting with government

officials. For its part, the government has also evidenced discretion. While elected officials have often vociferously objected to the publication of stories on national security, this has rarely been accompanied by legal proceedings against news outlets or their sources. In addition, in the rare cases where the government has sought a legal injunction, courts have placed the onus on the government, setting a high bar for restricting press freedom in the name of national security.

Stone, Geoffrey R. "Government Secrecy vs. Freedom of the Press." *Harvard Law and Policy Review*, v.185/1 (2007).

newspapers against the site was an early battle in the Internet copyright wars. Free Republic has all the hallmarks of "thick" community as described by Bruce Bimber and others, employing inside jokes, longstanding traditions, and celebrating a shared history. In the early days of the discussion forum, the site attracted participants who were influential actors in the Bill Clinton/Monica Lewinsky scandal, including Lucianne Goldberg, who is credited with coining the term *Freepers* to refer to members of the community. Free Republic was also linked from the front page of the Drudge report during that site's rise in influence among conservatives.

As the community gained a measure of publicity, it also attracted the attention of two major newspapers, the *Los Angeles Times* and the *Washington Post*. The practice of copying and pasting articles from major media Web sites into Free Republic prompted a lawsuit by the newspapers, which ultimately established a precedent in copyright law and the Internet (*L.A. Times v. Free Republic*, 1999). After the lawsuit, Free Republic agreed to impose rules for excerpting and linking articles. More recently, members of Free Republic were involved in challenging Dan Rather's credibility during the George W. Bush National Guard controversy. The charge of "forged documents" ultimately led to Rather's exit from the anchor position at CBS in 2004.

The Web site was founded and is still owned by Jim Robinson of Fresno, California, a private citizen who operates the site as a sole proprietorship with assistance from his brother and a small number of paid moderators. He accepts no advertising, but conducts quarterly fundraising campaigns. In 2013, the "Freepathon" goal was approximately \$85,000. In 2008, the quarterly goal was \$70,000. In appearance and in technical affordances, the site has remained virtually unchanged for more than a decade. Personalizing homepages and posting images on Free Republic requires a rudimentary grasp of HTML. There is a sidebar featuring "breaking news" with other categories that can be customized by the user. Behind the public channels of communication, participants are also provided with an e-mail feature, and use this feature to create "ping lists." The ping lists notify a group of subscribers when a thread is posted in a particular category.

FreeRepublic.com

Free Republic is one of the best known and earliest manifestations of political community online, as well as one of the most influential conservative voices on the Web. A discussion forum that originally emerged in 1996, the site has played a role in political scandals, including the Clinton impeachment scandal and the controversy involving CBS and Dan Rather during the 2004 presidential campaign. A lawsuit by major

For example, longtime participant “wagglebee” maintains a “moral absolutes” ping list. Topics include homosexuality, abortion, and euthanasia.

On all posts, hovering over the screen name of the poster generates a pop-up that reveals the account sign-up date. This information is used as a kind of hierarchy, especially to challenge “newbies” who post messages that are not in line with the ideology of the site. Failure to meet conservative standards results in “zotting,” the Freepier term for suspension of a user’s account. Moderation at Free Republic is quite strict. New members go through a probationary period, during which moderators must approve their posts before they appear on the site. If a particular story generates a raucous, relatively risqué, and/or contentious conversation, or has a provocative title, it is often moved to the “Smoky Backroom.” Some examples from this category include “Study finds woman (sic) have thicker skulls,” and “Paraplegic man dumped in gutter sues L.A. hospital.” Regularly posted threads such as the “Freepier Canteen” and the “Sunday Morning Talk Show Thread” provide a sense of continuity and are faithfully maintained by long-term members of the community.

Posting conventions are strictly enforced. Threads that contain links must be titled exactly as they are in the original source, although posters will sometimes add comments as parenthetical statements. These statements are expected when a story features a positive angle on the opposing ideology. In these cases, participants include a parenthetical warning in the form of a “barf alert” or “mega barf alert” or some other variation. The parenthetical “Dinosaur Media Death Watch™” accompanies stories about declines in newspaper readership or low ratings for broadcast media. Posts that do not contain a link to an external source, but are instead entirely the work of a member of the site, are labeled “Vanity,” and are rarely posted in “News/Activism.”

In recent years, the number of participants at Free Republic has decreased, as during each election cycle members of the community who support candidates who are not considered conservative enough are purged. During 2008, supporters of Rudolph Giuliani were purged. Early in the 2012 primary season, some supporters of Mitt Romney were purged. Jim Robinson addressed

this issue in a thread posted January 19, 2011. In his essay, he vowed to hold the line against “homosexualists, abortionists, big spenders, big taxers, big government solutions advocates, gun grabbers, pacifists, isolationists, environmentalists, open-borders lobbyists, etc.” The evolution of Free Republic over almost two decades online reflects a growing dissatisfaction among some conservative citizens with the elected officials who represent them. During the campaigns of John McCain and Mitt Romney, members of Free Republic were reluctant supporters of the Republican nominees, declaring them “RINOs” (Republican in Name Only). Still, despite purges and often contentious discussions, Free Republic is also evidence of the power of Web-based political communities to endure over time and influence both mainstream media and online political discourse.

Friendster

Friendster was one of the original social networking sites. It was a free site that allowed users to interact with friends and to use those friends to meet new people. The concept was based on a social networking technique used in networking virtual communities called Circle of Friends. This

allowed people to reach out and meet other people with whom their friends were linked. As users became acquainted with more people, they could add them to their circles and expand their networks. This allowed for social networking within relatively safe communities because of shared connections.

Friendster was founded in March 2002, in Mountain View, California, by Jonathan Abrams, Peter Chin, and Dave Lee. The name Friendster was based the popular peer-to-peer file-sharing site Napster. As one of the first social networking sites, Friendster is often credited with opening doors to other popular social networking sites such as MySpace, which launched in 2003; and Facebook, which launched in 2004. Friendster's contribution to social media and politics is that it broke ground for these later organizations, which continue to play an escalating role in the digital-age political arena.

The founders envisioned the site as a safe environment in which users could make new connections, both online and in the real world. A primary premise of the site was to establish dating connections by focusing on extended social circles. It was assumed that friends of friends offered better romantic partners than strangers.

The focus on Friendster was the individual profile. Within the individual profiles, users could install widgets and customize the layout of their pages. Profiles also featured photo albums and video sections and allowed for the use of avatars and the creation of blogs. Users were able to contact other users and share online content and media with their contacts.

Profiles included tags that provided hyperlinks to others with similar interests. Originally, users could connect with other members who were separated by no more than four degrees. Thus, users could connect with friends of friends of friends. Some users sought to expand beyond these four degrees of separation by creating Fakesters. Fakesters were made-up personas, usually centered on fictional characters or broad topics. In this way, a user could create a profile for Harry Potter, and then fans of the book could connect with other fans, even though they had no other association.

The site found quick success and achieved more than 3 million users in less than three months

after its launch. It was so successful that Google offered to buy the site for \$30 million in 2003. The site declined this offer, a move that many critics still believe was a major mistake. The site was so successful that it maintained its position as the number one social networking site until April 2004, when it was surpassed by Myspace in number of page views.

Competition and Acquisition

Myspace and Facebook were both able to take users away from Friendster. One reason for this was Friendster's status as a pioneer; the latecomers were able to improve on the weaknesses of Friendster. Whereas the focus of Friendster was one's individual profile, the competitors created sites that were more interactive. The competitors were also able to offer more functionality and cleaner pages.

While other sites surpassed Friendster in terms of popularity in the United States, Friendster was able to build a strong presence in Asia. Tapping into this market allowed Friendster to reach peak popularity in 2008, when it tallied 115 million members. By 2009, it was available in 11 languages and allowed users to enter content in any language. Friendster became the first global online social network to support Asian and other languages on a single domain, which made it possible for people from all over the world to communicate with each other.

Friendster also found success with the venture capital community. It launched with an initial round of \$12 million from Kleiner Perkins Caufield and Byers, Benchmark Capital, and private investors. These investors increased their support by providing an additional \$3 million in 2006. Friendster received another round of funding later in 2006, securing \$10 million in a round led by DAG Ventures. This was followed by another round of funding in 2008, in which the company sought to raise \$20 million in a round led by IDG Ventures. Finally, in 2009, Friendster was acquired by MOL Global, Asia's largest Internet company, for \$26.4 million.

An often-overlooked strength of Friendster was the wealth of patents the company held. Because it was a pioneer in social networking, it developed a vast array of patents related to this growing industry, including technology that

gauges similarities between users, compatibility scoring, storage of social data relationships, content management, and the web-of-friends programming that allows one to see connections between friends. Friendster sold many of these patents in 2010. At this time, it was rumored that Facebook bought 18 of these patents for an estimated \$39.5 million.

The acquisition by MOL Global solidified Friendster's focus on Asian markets. Now, the vast majority of Friendster users come from Asia, where its two biggest markets are the Philippines and Indonesia. In June 2011, Friendster transitioned to a social gaming platform with a new slogan of "Living the Game." While accounts remained active and retained contact lists, this transition resulting in the removal of user profiles. This included removing all photos, messages, blog posts, user forums, and groups. Although the company announced the move and provided tools to export content, the change was met with a great deal of controversy.

Now based in Kuala Lumpur, Malaysia, the new focus of the site is on entertainment and games as Friendster seeks to reposition itself from a competitor to a complementary service to sites such as Facebook. The site is now working with game developers and publishers to create content. By combining this content with MOL's payment channels, the company hopes to monetize Friendster's user base.

Friend-to-Friend Strategies

Friend-to-friend and peer-to-peer networks form distinct topologies of exchange on the Internet based on the distribution of activities, tasks, and resources among the members of a relational community. Usually, all members are assigned the same role, and they have the same power and privileges. On the other hand, each participant shares part of his or her resources, and they contribute at the same time as suppliers and consumers.

Both friend-to-friend and peer-to-peer topologies are examples of network decentralization dynamics, a type of social media communication paradigm that is of growing interest in both candidate and advocacy politics. From social network theory, centralization refers to the degree to which a network adjusts to a star graph topology. A star graph is the most centralized model of a network, in which all members of the network exchange information or resources through a central node. Taking the example of the Internet, the central node could be a server or the administrator of a forum.

On the other hand, the maximum level of decentralization takes place in a network where all the nodes are connected to each other. In this case, information can flow between members, without the restriction of necessarily passing through a central node. All members are simultaneously sending and receiving information and resources, deploying equivalent roles and positions. Although the maximum level of centralization/decentralization is infrequent in real networks, friend-to-friend topologies are more akin to the second model.

Friend-to-friend networks are based on a collaborative exchange strategy within a relatively bounded network. This topology has been the base for file sharing, information exchange, document editing, and Wiki collaborative work, among

other activities through the Internet. Friend-to-friend strategies are frequently based on peer-to-peer computing networks, and have been applied to research, marketing campaigns, crowdfunding, and fundraising activities.

In 2000, Dan Bricklin differentiated between friend-to-friend and peer-to-peer networks. Large peer-to-peer networks frequently suffer from spam, invasion of privacy, and other trust problems that are common in environments without a central authority or administrator. Bricklin contributed to the creation of smaller networks, where a higher portion of the members knew each other, which were called “friend to friend networks” because they were based on strong relationships between participants. The resulting structures are usually more flexible, and more easily allow for the introduction of changes in access and operating models. However, Bricklin observed that some problems of trust and invasion of privacy could still arise when connecting with friends of a friend, anticipating some of the difficulties currently observed in social networking Web sites.

Applications for Marketing

Recently, friend-to-friend structures of social networking Web sites have been used to spread marketing messages by brands. For instance, brand “likes” on Facebook may be useful to reach a high number of potential consumers, with the expectation that recommendations coming from a friend can have more impact than direct messages from the brand to the consumer. People who like some brands and publicly share their opinion are potential recommenders of those brands to their friends and could become staunch brand advocates.

Viral marketing is also an example of friend-to-friend strategies. Companies and organizations use this approach to increase brand visibility or to introduce a product in the market. For this purpose, marketing campaigns are based on word-of-mouth dynamics. Network topologies are used to understand the passing of information from person to person and to design an effective diffusion process. The spread will be faster if the key players in the network are reached; these are the most or better connected individuals. For instance, centrality has been

successfully used for optimizing information spread in the network. Additionally, effective campaigns are able to reach a critical mass, or “tipping point,” in the terminology popularized by Malcolm Gladwell.

Keller and Berry proposed six rules for developing an influential strategy and achieving a multiplier effect: (1) to target media that is information oriented; (2) to listen and to be reactive to consumers that complain, as far as influential individuals tend to criticize; (3) to support local causes, addressing community needs; (4) to focus on practical services; (5) to take into account special products; and (6) to take advantage of loyalty to the brand. The main approach for marketing campaigns consists of identifying local opinion leaders and promoting network diffusion dynamics in the community.

Some electronic applications, such as Wrapp, are inspired by friend-to-friend strategies. Wrapp offers free or paid gift cards that are sponsored by brands, which people can use in their everyday communications with friends by adding those gift cards to their messages, mainly on social networking Web sites. This way, companies gain a presence in thousands of communications and information exchanges that occur daily on Facebook. Consequently, brands are part of the contents of the interactions among users of social networking Web sites. Although these strategies are based on traditional word-of-mouth processes, they take advantage of social media for augmenting and accelerating the diffusion process.

Fundraising

Crowdfunding is an application of a friend-to-friend strategy for fundraising. Traditionally, organizations engaged supporters to raise funds through their personal networks of friends, family, and colleagues. At present, certain organizations use social media tools to raise funds. For instance, organizations may create donation Web sites or widgets located in personal blogs to directly reach family, friends, and acquaintances of engaged members and volunteers.

Through friend-to-friend dynamics, nongovernmental organizations access the networks of their partners, supporters, or sympathizers to more easily raise funds and resources. Some

online tools used for this purpose include: Razoo, Firstgiving, Amicus, and CauseVox.

Finally, grid computing consists of a distributed system of computer resources from different locations with a common goal. This has been widely used in research projects that require a large storage and processing capacity, as in the case of cryptography, physics, astronomy, mathematics, and artificial intelligence. Individuals and institutions share their computing capacity in peer-to-peer networks to participate in ambitious research projects.

One of the earliest and more famous examples of grid computing is the SETI project, which seeks evidence of extraterrestrial life analyzing radio frequencies coming from space. SETI uses more than 200,000 interconnected computer units around the world.

Friend-to-friend strategies are interventions that are based in exchange dynamics that take place in decentralized networks. Trust, reciprocity, and personal relationships facilitate fundraising, brand dissemination, scientific research, and the change of social norms. The identification of key players, application of friend-based recommendation systems, and promotion of network diffusion processes are effective strategies to achieve a multiplier effect, to reach the tipping point for change at the community level.

Functionality

In general terms, "functionality" refers to what hardware and software can do for a prototypical user. Functionality in the context of social media, can be said to refer to a set of functions or capabilities associated with a particular social networking service. Thus, when elaborating on functionality, it becomes important to recognize that it has a substructure consisting of self-contained units of computational code, or functions. In computer science, a function is an independent part of a program's entire code that instructs the computer to perform a specific assignment.

Functions can be standardized to a certain degree because many functions will be reusable throughout an entire program or service. The idea behind this reusability is, apart from reducing the intellectual effort of programmers, also a reduction of redundancy, that is, to make the program as small and effective as possible. As Derek Robinson explains, functions are usually designed to perform a delimited task as efficiently as possible. As such, a small function is logical and deterministic—it always produces a predictable result. However, a complex program will consist of many functions. As mentioned, this larger aggregated set of functions is what can be referred to as functionality.

Additionally, in order to provide overview and control of functionality, a graphical user interface is usually necessary. So, while functions are mechanic in the sense that they must generate a consistent result when invoked, a complex program or service can be used and experienced rather differently depending on the user, task, and context. Thus, when discussing functionality, it is necessary to also widen the perspective to include concepts from interaction design and user-experience research.

An abstract model of functionality can consist of a code layer, feature layer, and user experience layer. The code layer entails a source code in some form. The source code has been ordered into processes, operations, and functions that instruct a machine to perform in a certain way. Inbetween the code layer (which is an underlying structure usually hidden from the user) and the user-experience layer (stories, feelings, and values connected to the use of a certain product, system,

or service), there is the feature level. A feature is made up of a general function and its interface instantiation. The reason these two concepts need to be connected is that a function can be instantiated in many different ways in an actual interface (and the interface is an important part of the user experience). The feature is often the level referenced by users when communicating about or referring to specific aspects of a certain software package or online service.

On a pragmatic level, users may refer to both the material aspects of information technologies as well as the more humanistic or experiential aspects (what it does and how it looks). As such, the feature level is a material and discursive composite that shows how code can come to form meaningful abstractions that are then used, interpreted, and referred to by everyday users. The user-experience layer entails the full range of aggregated features and how these work (or do not work) together in a product, system, or service. It also includes the way users feel, make meaning of, and value aspects of the human-machine interaction, including user perceptions of the general utility, ease of use, and efficiency of the product, system, or service.

Conclusion

In summary, functionality in social media refers to the interaction between the user and the social networking service, particularly with reference to the performance of this interaction. An analysis of functionality can be performed on several levels, including the code level, feature level, and user-experience level or ideally, as an intersection of all these levels.

Fundly

The recent increased popularity of crowdfunding—a way for organizations or individuals to share their ideas with communities to garner support in the form of donations and investments—is generating distinct modifications in the way that individuals and organizations relate to donors.

Fundly is leading this fundraising renaissance with its unique SaaS based platform, which renders potential donors 10 times more likely to donate than with other fundraising platforms. With many different crowdfunding platforms available, Fundly sought a unique edge—the use of social media and highly integrated software. Unlike many other crowdfunding Web sites, Fundly supports a simple java-based platform that allows donors to give directly from the organization's or individual's Web site, instead of being redirected to an entirely different Web page to donate.

This simplifies the donation process. Fundly also offers members the option of creating a new page if they do not already have a Web site. Once donors have given to the organization or individual through Fundly, they are then prompted to tell their friends via Facebook, Twitter, e-mail, or other form of social media. The concept of friends asking friends for support gives Fundly its edge among other online fundraising platforms. Fundly has become an important fundraising tool, employed by political figures during the most recent elections, and likely will continue to provide greater fundraising potential for candidates who decide to utilize Fundly's potential in future elections.

Fundly has been dubbed the world's number one crowdfunding platform for social good. The fundraising platform allows individuals and organizations to leverage the power of their social networks and the social networks of their supporters to broaden their donation base. Combining peer-to-peer interaction with online fundraising creates a sense of community support around giving. This system of connections leads to the success that clients experience when using Fundly. Fundly keeps the connection going by automatically notifying others in the donor's network when they make a donation, and by keeping them up-to-date on the latest news or milestones surrounding the cause. This process of friends asking friends to donate is believed to be more effective, generating up to 52 percent higher funds than traditional cold calling.

The "social multiplier effect" that Fundly creates combats the "one and done" mentality that accompanies online giving by making contributors feel that they are connected to the cause. Instead of just a name and donation amount that an organization would typically receive from an offline donation, they receive far more information from Fundly. Receiving this additional information, such as an e-mail address and social media connections, allows causes to keep connections going with their funders. A supporter gives to a cause because they believe in it, so they will want to share this cause with others in a simple, quick way. People are becoming increasingly attached to social media, so they can connect with donors through the sites they use most.

Online fundraising is still relatively new, with only 13 percent of donations provided over the Web in 2009. This lack of utilization was one of the driving forces behind the development of Fundly. For people to give online, the process must be simple, quick, and secure—three of the key characteristics of Fundly. Fundly entered the world of online giving in 2009, under the name BlueSwarm, but began to see increased popularity in 2010 when it relocated its headquarters to California after receiving new investment capital and changed its name to Fundly. David Boyce, CEO of Fundly, knew that he was onto something when online charitable giving grew by 55 percent in 2010. Since their launch, Fundly has helped over 30,000 individuals and organizations collect over

\$305 million in donations. While the organization has already made great strides toward its mission of "helping more people give more," it continues to develop partnerships that will further increase the fundraising potential of its clients.

Two of these recent partnerships have been with Charity Dynamics and Bloomerang. Charity Dynamics, a leading online marketing agency, will assist Fundly clients in creating and launching customized crowdfunding campaigns. Bloomerang, a customer relationship management software company, will provide Fundly's clients with advice and tools for increasing donor retention and loyalty. This partnership will also help resolve any hassle currently associated with data transfers and information sharing between Fundly and donor-related software. These unique partnerships will now combat common fundraising problems of both donor acquisition and retention through social media. Fundly allows organizations and individuals to collect all donated funds, whether or not the fundraising goal has been met.

This places responsibility on the individual or organization to ensure that a project is completed. This makes it easier for organizations and individuals to receive their funds, but could potentially create problems for funders who want reassurance that the cause they are funding will be completed. Fundly takes 4.9 percent of each transaction, generally less than other crowdfunding platforms. This is ideal for individuals or small organization because it allows them to begin fundraising online with no start-up costs. Fundly also offers fundraising packages, including online support and additional resources that may appeal to larger organizations willing to pay a monthly fee. Fundly appeals to organizations of all sizes as well as individual campaigns with its diverse fundraising options that fit the needs of heterogeneous groups.

Fundly has helped a variety of individuals and organizations fundraise since its launch, including the Red Cross, Teach for America, the University of Massachusetts Amherst, and political figures such as Meg Whitman. During her 2010 campaign for governor of California, Meg Whitman raised over \$20 million using Fundly's online donation system. The ability of her supporters to share her cause with friends via social media expanded her donation base, allowing her

to reach a higher fundraising potential. Fundly and crowdfunding will never replace traditional fundraising plans, but it offers an innovative tool in expanding online donations for both organizations and individuals.

Fund-Raising

Social media have changed the political landscape in the United States and globally with their power to organize new types of civic and political participation. Social media fund-raising can be defined as funds donated in response to a solicitation sent via at least one social media outlet. Fund-raising by political campaigns and advocacy organizations through social media applications is an increasingly important component of these groups' overall strategies for mobilizing new pockets of donors and supporters online. Social media fund-raising differs from earlier Web site-based fund-raising because of the ways that social media messages can be used

to drive traffic to specific donation Web sites, repost e-mail messages, or quickly communicate to users the importance of fund-raising as an expression of commitment to a candidate or issue. The use of social media for this purpose has led to the development of fund-raising mechanisms that have empowered previously disadvantaged candidates and organizations.

Two important themes provide a foundation for understanding this topic: What are the techniques with which social media have been harnessed for fund-raising purposes? What groups are the most effective at using this fund-raising technique?

There is mixed evidence on the adoption of social media fund-raising techniques, depending on the type of organization in question. Three important types of political groups use social media and related fund-raising techniques: candidate-supporting organizations, nonprofit advocacy organizations, and political campaigns. These three types of organizations together represent the large number of ways that social media have allowed citizens to participate in the political process.

Candidate-Supporting Organizations

Among independent, candidate-supporting organizations, left-leaning and progressive causes in the United States have benefited from the use of social media for fund-raising purposes. DailyKos.com, a major political blog, has demonstrated considerable influence in raising funds for liberal Democratic candidates endorsed by the site. In the 2006 midterm election, the blog raised funds for 17 candidates. This effort resulted in more funds raised for five candidates than the official Democratic Party. These funds helped nearly half of the Kos slate gain election.

By far, one of the most influential advocacy organizations in terms of social media fund-raising is MoveOn.org. This organization has successfully mobilized fund-raising and grassroots action in the United States for both political candidates and political issues. MoveOn's online communications blend Web site and social media formats and seamlessly combine the mobilization of local groups (or councils) with coordinated fund-raising appeals. Most importantly, MoveOn has demonstrated a sustained ability to financially

support the election of candidates friendly to its policy positions.

However, the social media fund-raising sphere is not without some important conservative examples. More recently, the Tea Party movement also reflected an ability to use social media to harness decentralized social networks in order to mobilize support (volunteer and financial) for endorsed candidates. Additionally, J. McNutt and others have found that there is no meaningful, consistent partisan difference in the use of social media by Republican and Democratic legislators and their constituent relations networks.

Nonprofit Advocacy Organizations

Social media fund-raising is not limited to organizations that support candidates. Issue advocacy organizations, such as environmental groups and organizations that engage in both charitable work and advocacy activities, such as organizations that serve the disabled or other target populations, also use social media for fund-raising in conjunction with community-building messages and content.

Only recently have scholars begun to understand exactly how political advocacy groups use social media to advance their agendas. In one study, Chao Guo and Gregory Saxton analyzed the Twitter messages of 188 501(c) 3 nonprofit advocacy groups in the United States. They found that messages requesting donations were among the least common types of messages, which they interpret as a natural result of the fact because certain relationships must be in place before action can reasonably be requested.

Despite the difficulty of specifying an exact number of organizations that use social media for fund-raising purposes, some research suggests that the use of social media may differ across type of issue advocacy organization. D. S. Bortree and T. Seltzer find that environmental organizations do not make great use of social media other than to share information. H. R. Edwards and R. Hoefer argue that social work advocacy groups are still struggling to adequately get beyond the information stage with their Web sites, and have not begun to systematically adopt social media technologies. In general researchers have found that most nonprofit use of social media focuses on conveying information, rather than on mobilizing

funds and volunteers for advocacy. This finding seems to apply across different types of nonprofit advocacy organizations.

Political Campaigns

With the well-known role of the Triple O online fund-raising team of Barack Obama, the study of social media fund-raising in political campaigns has become a topic of serious practical importance. In reality, however, the use of social media in political campaigns began at the end of the 20th century. The fund-raising aspect of these uses has become more sophisticated than among most advocacy organizations, but the pattern of use closely coincides with that of advocacy organizations. Social media fund-raising plays a role in political campaigns at all levels, but for the sake of simplicity, examples in this section will be limited to American presidential campaigns.

George W. Bush and John McCain both received attention for accepting donations online during the 2000 presidential campaign. President Bush became most widely known for encouraging online donations after the September 11 attacks. In terms of fund-raising for election, however, the Republican strategy remained connected to its traditional grassroots networks.

The first point at which the use of social media fund-raising became a topic of mainstream discussion was the success of the Howard Dean presidential campaign online in the 2004 presidential election cycle. More than half of Dean's fund-raising was from small donations (under \$200) online. This phenomenon led to a dramatic change in the role of small donors in the political fund-raising process. Conventional wisdom had held that only large donors could have a sustained influence on elections. Dean's use of social media helped his campaign, but in the longer run, it demonstrated the influence that ordinary citizens could have on a national election.

The 2008 campaigns were a milestone and perhaps a permanent turning point in the use of social media for political fund-raising. It has been well documented that Barack Obama and his team raised around \$500 million online. It is estimated that around one-third to one-half of these donations were from small donors.

During the same election cycle, in stark organizational contrast, U.S. Representative Ron Paul's

2008 presidential campaign produced a netroots fund-raising effort surpassed in grassroots influence only by President Barack Obama's. One distinct difference, however, was the relative lack of influence exerted by Representative Paul's official campaign on this social media-based movement. Unofficial campaign logos and unsanctioned social media-based fund-raising events became the norm for activists. The term *moneybomb* was first used to describe agreed-upon dates when these activists would coordinate their donations. Despite the vast difference in the total amounts raised (only tens of millions for Paul, versus hundreds of millions for Obama), both cases demonstrate the relationship between community-building activities and fund-raising in the social media arena.

The sustained influence of Obama's online organization was evident in the 2012 re-election campaign. The Triple O operation undertook sophisticated message-targeting efforts. This culminated in the claim that, with amounts unspecified by the campaign, October 17, 2012, was the most lucrative single day of fund-raising in Obama campaign history. This result was fueled entirely by online donations. This result came on the heels of September 2012, when Obama and the Democratic Party raised \$181 million, the largest month of fund-raising in presidential history.

Social Media to Raise Funds

The Pew Internet and American Life Project has documented, through years of polling, that the number of people who donate online has consistently grown over the last two decades, as has the number of political campaigns and advocacy groups that have developed online fund-raising mechanisms. While earlier research focused on how much these organizations used social media, more recent research has turned to the important question of how and for what purpose these media are used. In the same vein, the emphasis of this research is on the dynamics of organizational communication, rather than on the specifics of current social media because these technologies are constantly evolving.

K. Lovejoy and R. D. Saxton identify three key communicative functions that are reflected in social media messages sent by nonprofit

Supporters of Ron Paul's presidential campaign on November 25, 2007. Some of Paul's donors created grassroots fund-raising campaigns in which many small donors would contribute simultaneously in a so-called moneybomb.

organizations. These authors suggest that the content of social media and other online communications be categorized as information, community, and action. As the names imply, information messages share information about the organization, its activities, or matters of potential interest to stakeholders; community entails messages that aim at fostering relationships with stakeholders, creating networks, and building communities; and action messages give stakeholders the chance to participate in the cause, either through some type of action or through donations.

Guo and Saxton further argue that these three types of social media communication should be viewed as dependent upon each other. Extending the information-community-action typology,

they propose a three-step pyramid model of social media-based advocacy. The first step is to reach out to stakeholders and communicate the message of the organization. The second step is to deepen the knowledge of stakeholders and sustain their interest in the organization. The third step is to mobilize engagement in the organization's cause. This pyramid model follows the general framework of traditional political and nonprofit fund-raising. The unique aspect of social media is the way that short messages on Twitter, online petitions, and hyperlinking can be used to create engagement opportunities unique to cyberspace. These engagement activities can then be linked directly to donation requests.

While the three-step framework has not been explicitly applied to political campaigns in scholarly research, studies of the behavior of candidate campaigns and online campaign activities clearly demonstrate that the same phenomenon is at work. As a result, the information, community, and action categories can be used to study social media messages across different types of organizations. It is also useful because it can help one interpret the relative importance of social media fund-raising (action) messages within an organization.

In practice, this framework is consistent with the finding that organizations and movements that adequately build online communities are the most effective at social media fund-raising. Specifically, the lasting influence of social media fund-raising has been to allow small donors to be counted in the political process. A small donation to a political campaign or issue advocacy group allows an ordinary citizen to join with other like-minded persons in a way that has a tangible influence on the political process. In particular, the 2008 presidential campaign demonstrated that small donors were no longer negligible. Additionally, as Guo and Saxton suggest, one lasting influence of social media is the ability of advocacy groups and campaigns to cultivate an active network of supporters who feel connected to the mission of the organization to a degree out of proportion to the amount of funds donated.

Conclusion

Social media fund-raising follows a common pattern of requiring that constituents be adequately

invested in the social network of the organization before contributing funds to a cause.

In order to raise support from followers and friends on social media, organizational communication needs to do more than simply provide information. The general relationship between community-building and action-motivated communications on social media applies to both advocacy organizations and political campaigns. It is likely that the role of social media fund-raising will only increase as more organizations begin to understand and harness the financial power of these media.

G

Gate Keeping Theory and Social Media

Gate keeping theory is often related to mass media and organizations, explaining why certain stories are selected and become news, and others are not. The concept of “gate keeping” was, however, not primarily conceptualized to explain a phenomenon pertaining to communication and media studies. It was created in 1947 by Kurt Lewin, a psychologist and pioneer in social psychology, who was interested in studying leadership and group dynamics. Lewin observed that certain individuals retain positions that allow them to decide what to pass to a group of people through each gate section, of which, in any process, there are several. These powerful individuals are known as gate keepers, or the “guards of the gate.” Based on personal or social influences, the gate keepers select and pass only certain commodities—materials, goods, and information—that they believe can help individuals to make sound decisions and secure social order.

Today, the concept of *gate keeper* has an extended meaning. Individuals, bloggers, media, political institutions, professional codes of conduct, company policies, and even computer algorithms can be considered gate keepers when they have control over diffusing information. In

politics, gate keepers are individuals who can control the access to powerful positions and regulate information flow, and thus control political influence. Many companies have precise policies for disclosing information that set specific guidelines on what should be communicated to external publics, and those policies function as gate keepers. Google uses algorithms to select the news items that readers can view in the dedicated news section of Google’s Web site, and this process is considered gate keeping.

Since the 1950s, gate keeping theory became one of the milestones of subsequent studies in communication and media fields. The theory provides a framework for analyzing, assessing, and knowing how news selection occurs, and why certain elements are selected or rejected. Most people rely on journalists to transform information into a manageable set of sound bites. Journalists’ selection of information contributes to the construction of social reality. Because gaining information often means gaining knowledge, and knowledge is power, gate keepers are considered very influential and powerful. It is therefore important to understand journalists’ processes of news selection to understand what people consume and how this may eventually affect their opinion on social reality. The first pioneer in using this concept in mass communication was David Manning White, who applied Lewin’s gate keeping idea to newspapers’

processes of news selection. White observed that journalists often filter unwanted, sensible, and/or controversial information, and publish only information that conforms to the journal's editorial standards and agenda, and/or information that is not against the news organization's policy. Because of this, White considered journalists the gate keepers of information.

The process of gate keeping in a news organization can occur at different stages of news production. At the initial stage, gate keeping takes place when news gatherers, such as reporters, writers, and local editors block certain messages coming from the external news environment and allow others to enter the news room; the role of news gatherers is to select certain stories and discharge others, not letting them pass the "gate." Journalists receive a large amount of stories and information on events by numerous organizations, institutions, companies, and politicians. They need to select what it is relevant from what is not, before transforming the selected stories into news copy. Gate keeping does not only occur within the newspaper environment, in the news room, but it can also happen at an early stage when reporters collect stories on the street. At the final stage, news processors, such as editors, copyreaders, and translators modify and integrate news copies and decide how it should be transmitted to the audience. This process is also gate keeping because news processors are in the position to filter, shape, and change the priority and format of the stories that they want to transmit to their audience.

Studies concerning the gate keeping role of news media have initially focused on the decision process for selecting the news events to publish—what to include or exclude. Later, scholars became more interested in understanding other variables related to the selection procedures, for instance, the processes of decisions related to the time/space allotted to a news event, the number of graphics and stories about the event, where the news event was placed within a publication or program, and to which extent the event was covered by subsequent news stories, also called "news circularity." Gate keeping theory contributed to the development of successive theories, such as agenda setting and framing theories. Several scholars believe that the concept of gate keeping is vital in any type of communication planning.

The event of Internet and digital media has, however, substantially changed the identity and role of gate keepers, as well as the process of gate keeping. The Internet has made information more easily and readily available, which means that time has become a great restraint for checking truth and accuracy of the information reported. Additionally, in democratic societies, the controlling and/or blocking of information is limited to specific online contents, for instance, pertaining child pornography, hate speech, defamation, or theft of intellectual property. The new digital era has also introduced a new stage in the gate keeping process, whereby digital audiences participate as secondary gate keepers on the Internet.

Today, bloggers and digital citizens are increasingly the gate keepers of world news. Multiple news stories about events are available online, and the credibility of the source posting that content has become a major issue in online news reporting. Critics of citizen journalism point out that such journalism undermines the essential role of journalists as organizers and makers of sense of what is happening around the world. While newer communication technologies have facilitated the creation and diffusion of online content, the content offered may be biased and/or unrestricted from judgments, and thus can deteriorate the quality of news. On the other hand, the presence of information gate keepers outside news rooms has put pressure on journalists to be more transparent in their news selection processes, and indirectly this is positive because it reduces the power of media organizations in setting public agendas.

Gender

When speaking about gender as a socially constructed phenomenon, one usually refers to the duality of two major social categories: women and men. Sociologists differentiate between more than two gender identities, though it is still a rather common stage of analysis in the social sciences to discover whether any significant differences exist between the behavioral patterns, opinions, value orientations, and intentions between female and male respondents. A similar approach might be applied to the sphere of social media: gender particularities in the use of Facebook, Twitter, YouTube and other platforms. People of any gender identity use social media for different reasons: for making and keeping social contacts, supporting informal learning practices, reflecting on daily life events, and sharing and discussing the continuously increasing body of information available over the Internet. However, recent studies discover that women and men demonstrate slightly different patterns of using social media.

When studying male–female performance in social media, it is necessary to consider that gender identity is not predetermined from birth, but is (re)constructed in representing oneself and interpreting others according to time, place, and audience, in ways that are influenced by community. Within this approach, construction of gender is an interactive process in which individuals are both objects and subjects of gender definition through their physical and textual performances. The character and influence of an individual's contribution within this interaction process are affected both by available cultural representations that compose the sources of meaning-making, and by existing power structures. Therefore, social media can be considered a potential agent of social change with respect to gender oppression and discrimination on different levels.

That leads to another aspect of interconnection between gender and social media, the actual representation of various individuals and groups using social media engines. This becomes essential when the profiles and activities of politicians are studied. Also, gender minorities such as lesbian, gay, bisexual, and transgender (LGBT) groups should be considered when analyzing the representation and activity of minorities in social media. For the latter, it becomes even more crucial when it is necessary to provide wide audiences with up-to-date information about LGBT politics to disseminate news and generate discussion.

Gender Differences in Using Social Media

When social networking sites spread in the Internet, women as well as men quickly adopted the new type of mediated communication. Results of a recent study by Kimbrough and colleagues in 2012 indicate that women, compared to men, are generally more frequent mediated communication users. Women prefer and more frequently use text messaging, social media, and online video calls. They also use Facebook more for maintaining existing relationships, whereas men follow an agentic pattern, using the sites more for making new relationships and finding job leads. The authors also refer to a study from 2008 that found equal shares of men and women among Facebook users, and to a 2009 study, which demonstrated that 57 percent of Facebook users were women and 43 percent were men. This change could be because of the rapid growth that occurred between 2007 and 2009, from 50 to 300 million Facebook users. During this period, women over 40 years old were the fastest growing demographic on social networking sites.

In a study conducted by the Center for the Digital Future, nearly half of young women reported having met offline with an online community contact, whereas barely a third of young men reported having done so. A global study conducted by ComScore Inc. in 2010 found that social networking sites are used by a higher percentage of online women (76 percent) than online men (70 percent). A study of college students in the United Kingdom conducted in 2010 revealed that the driving factors behind joining a social network differ substantially by gender, with female participants joining to be generally sociable and

A Haitian woman works with Twitter during a technology training session on September 10, 2011, with a local rape crisis center called KOFIVIV (Commission for Women Victims for Victims) and an independent U.S. nonprofit called Digital Democracy. The training was part of preparations for the launch of a free hotline to allow women in Port-au-Prince to report rapes and other violence.

keep in touch with friends, and male participants joining based on peer pressure from friends and to make new friends. Another survey conducted among U.S. university undergraduates in 2012 aimed to explore gender differences in social networking, particularly for Facebook use.

According to the findings of the survey, 80 percent of respondents reported that Facebook was a part of their everyday activities. Almost 9 of 10 undergraduate women “strongly agreed” or “agreed” with this survey item (females: 88 percent “strongly agree” and “agree”; males: 71 percent “strongly agree” and “agree”). The study findings also proved that both genders use social media, but women far exceed men in the time they spend on social media. In other results, females reported spending almost 62 percent of their Internet time on Facebook, compared to 44 percent for males. Furthermore, there were significant differences in the share of women

compared to men who were “heavy” Facebook users (more than one hour per day) and in the minutes spent daily examining others’ Facebook profiles (females: 24 minutes; males: 10 minutes). It is possible that males utilize social networking sites other than Facebook, and females are primarily drawn to Facebook.

Another nationwide survey of 600 adults (296 men and 304 women) in the United States about social media site use was conducted by United Sample Inc. (uSamp). Among the top findings, uSamp found that “striking differences” exist between men and women when it comes to sharing personal information on sites such as Facebook (used by 81 percent of respondents), YouTube (46 percent), Twitter (33 percent), and Myspace (32 percent). While almost three-quarters of men and women were willing to share their relationship status—and 62 percent were willing to share their religious affiliation—only 20 percent

of women would share their location, compared to 35 percent of men, reports uSamp. In addition, 55 percent of men say they wouldn't mind revealing their e-mail address, but just 41 percent of women would do so. In all, just 8 percent of respondents were willing to share their physical address. Among the segments by age, those aged between 18 and 24 are the most active, with 86 percent of men and 86 percent of women visiting social media sites daily.

Gender differences observed using social networking sites are also found in other online environments. In Second Life, a virtual online community, people behaved according to traditional gender role expectations. Specifically, the results of the study indicated that women were engaged in more communal activities, such as meeting people and shopping, while men reportedly engaged in more agentic activities, such as building things and owning property. Thus, even when men and women have the freedom to behave in any way they want, they still prefer to behave in a way that is consistent with social gender role expectations.

Constructing and Reproducing Gender Identities

There are also a number of studies of how social media can impact construction of gender identities and reproduction of gender stereotypes. First, it was hoped that a multiplicity of widely distributable first-person performances might enable the destruction or destabilization of constraining accounts of gendered identity and undermine the regime of shame used to enforce them. It was also supposed that social media would empower young women to counter mainstream media stereotypes and provide them with the discursive power to intentionally construct new and more vibrant definitions of what it means to be a "girl." Social media have been theorized as a space for female users to expand not only the scope of their engagement and influence, but also the strength of their influence on constraining understandings of gender.

Women are not only better enabled to exchange comments, build relationships, and exchange social capital via social media, but they are also empowered to engage in discussions telling their personal stories. As a result, women could

experience an enhanced sense of expressive autonomy. More broadly, widespread dissemination of diverse and multiple narratives about female lives written by girls might begin to trouble dominant, stereotypical definitions of "girl" and gender-based constraints that inhibit the achievement of social equality.

However, the narrow presentation of "woman" as sexually self-objectifying and focused on looks in order to "get a man" is widely spread in all forms of mass media and advertising, and a number of scholars argue that such media stereotypes powerfully influence the self-formative processes of youngsters. Since girls and young women tend to use the mainstream corporate sites that contain high levels of advertising on their pages, these same stereotypes are deeply embedded in social media platforms. Some studies reveal that girls spend a great deal of time selecting pictures of themselves that make them "look good" according to media standards of female beauty for further posting in social media.

The use of "glamour shots" is common because it facilitates the presentation of an idealized self as sexually attractive. Some studies of female avatars found seductively posed, partially undressed representations of girls are common on teen chat sites, and that sexualized images of girls are pervasive on Myspace. Other studies argue that the vast majority of female profiles feature pictures of them partially clad and seductively posed with their heads tilted, bodies angled sideways, and eyes looking up or at the camera, mirroring the shots common in printed magazines. Scholars conclude that such positioning of the self as always "up for it" and the "performance of confident sexual agency" has shifted to become a key regulative dimension of idealized femininity across mainstream media and advertising, and that there is now a visual rule for young women to display a sexy self on social networking sites.

The research conducted by Bailey and colleagues and published in 2013 indicates that stereotypical representations of girls as sexualized objects seeking male attention are commonly found in social networking sites. The authors present the results of a qualitative study that examined how young women "read" these stereotypes. Respondents understood social networking sites as a commoditized environment in which stereotypical kinds

of self-exposure by girls are markers of social success and popularity. As such, these images are “socially facilitative” for women.

However, the gendered risks of judgment according to familiar stereotypical norms are heightened by the intense surveillance enabled by social networking sites. While the respondents indicated that celebrity culture inculcates girls with messages that they must be attractive, have a boyfriend, and be part of the party scene, girls are much more likely than boys to be harshly judged for emphasizing these elements in their online profiles. Girls are also open to harsh criticism for their degree of publicness. The risk of being called a “slut” for having an open profile, too many friends, or posting too much information suggests that continuing discriminatory standards around public participation may effectively police girls’ capacity to fully participate online and complicate their ability to participate in defiant gender performances.

Finally, another form of reproducing stereotypes and dominating feminine identities is blogshops, online sites in which young women model and sell apparel via social media that have exploded in many countries. As an extremely popular form of e-commerce, blogshops have catapulted their owners and blogshop models to wealth and fame. The success of blogshops trades on commercial intimacies cultivated by blogshop models and the involvement of blogshop consumers in practices which some scholars also identify as “value (co-) creation.” Researchers who study this phenomenon of blogshops consider value (co-)creation as not focused on products.

Rather, it takes place around the online “micro-celebrity” of blogshop models and senses of homosocial intimacy between the persona of models and their audience of readers-cum-consumers. This focus on blogshop models’ persona implicates both models and consumers in a homosocial discourse around emphasized femininities, in which women’s bodies are subjected to a refracted male attention carried out by women in the absence of men. This discourse within the commercial sphere produces powerful and disciplining effects for both blogshop consumers and the models, thus highlighting deeply gendered intersections of femininity and commerce in online processes of value (co-)creation.

Representation of Female Politicians

Female candidates and politicians ought to attract more attention and become more visible within the social media so that affirmative measures such as quotas may positively affect women’s involvement in politics and change women’s role models. This concerns the role of elite communication in shaping and changing public opinion. In particular, in the modern media-dependent society, a great responsibility is entrusted to the media system because coverage of women politicians (or the absence of coverage) has the potential of challenging or reinforcing women’s marginalization in public life. One of the obstacles that women politicians perceive as the hardest to cope with is their restricted access to the media.

Recent studies of social media and electoral campaigns of male and female candidates discovered the relationship between using digital media in a candidate’s political campaign strategy and voter support factors such as a candidate’s use of the Web and social networking sites in conjunction with other traditional influences such as candidate gender. Having a robust Web presence and using social media, holding other factors constant, can be a significant contribution to the popularity of a candidate on the day of election. Tactics of active social media representation might be specifically beneficial to traditionally disadvantaged candidates in bridging the gap of their under-representation in national and regional political institutions.

The importance of studying female politicians’ representation in social media is especially striking, taking into consideration the recent research results on the successes of male candidates in presidential elections because of active campaigns in social media. Additionally, social media plays an important role in outlining a politician’s activity after the election. A good example is the active use of social media by 2008 presidential candidate and U.S. Secretary of State Hillary Clinton. However, there is a gap in available case studies that focus attention on female candidates, despite the numerous studies of male politicians’ representation in Facebook or Twitter.

Gender Minorities’ Representation

The expansion of technological access has led to substantial shifting in opportunities to connect

geographically dispersed members of marginalized groups. Social media engines offer less powerful individuals access to challenging the social order. They address the central problems impeding the effectiveness of organizing gender minority groups: isolation, repression, resource restriction, and lack of community cohesion. The relatively inexpensive social media offer a virtual public sphere open to a wide range of actors and expressions. This range is restricted by traditional sources of exclusion, such as race and ethnicity, gender, class, and geographical location. But the increasing accessibility of travel within cyberspace helps to mediate restrictions. As a result, the Internet and social media specifically can be especially important to marginal groups with limited finances or expectation of mainstream support for their views.

Studies from various countries demonstrate that the Internet and social media are used to overcome the social isolation of homosexuals because they can express the behavior patterns that can be socially labeled as deviant and fulfill personal and political needs online.

One comparison of LGBT Web sites in the United States, Germany, China, and Japan claimed that “there is no other forum in which so many people of so many different backgrounds have safely disclosed, and felt comfortable disclosing, their sexual identities.” Cyberspace is crucial for sexual minorities, according to legal scholar Edward Stein, because of social and legal discrimination that either compels them to be closeted, or punishes them should they emerge. In sharp contrast to mainstream society, cyberspace is an ideal environment and a “virtual lifeline.”

Scholars who have studied the lesbian community and its representation in Latin America emphasize that lesbians can find each other via the Internet, even if they are isolated in their daily lives; and if they can find a reasonably private place to go online, they can be “out” without fear of stigma or violence. Compared to the often-transient spaces of “women’s nights” at bars or cafés, or the expense of keeping up an office, Web sites offer a more stable and inexpensive platform for socializing and activism. E-mail, distribution lists, and social media are relatively accessible sources of alternative information, and are crucial for

communities ignored or criticized in traditional media channels. Finally, the Internet in general and social media in particular cannot end contentious regional debates over political practice, but they provide new possibilities for communication within and across national boundaries.

According to some scholars, the benefits of social media include the expansion of queer communities within and across national boundaries. Whereas homophobia and political subjugation have isolated LGBT individuals from others in their societies, and geography and politics have kept them separated from others, social media enable an emancipatory and community-building realm that transcends international borders. This potential globalization of communication and connection may allow a virtual escape from the repression and rejection of real-time interactions into a place of acceptance and solidarity.

Geo-Locational Enabling

Geo-location enabling has received growing attention by political campaign strategists, particularly in the past decade. Collaborative interactive online tools that track the geographical nature of information, most notably demographic data and voting trends, have numerous practical applications in political campaign strategy. Geo-location enabling has been used by political campaign strategists to identify and target potential voters in very specific geographic locations and encourage them to vote, to track candidates' campaign trails, and to analyze how national and international issues and concerns have local consequences for political campaigns.

History

While geo-locational enabling strategies have been used with increasing intensity in political campaigns, most notably since the 2008 U.S. presidential election, researchers and experts in the area of spatially aware mobile applications have recognized for decades that nearly all information relates to or can be traced back to specific places. Security and intelligence specialists have focused their information and communication technology development efforts on location-specific data gathering to enhance the national security efforts of government bureaus such as the U.S. Central Intelligence Agency and Federal Bureau of Investigation, the French Direction Centrale du Renseignement Intérieur, China's Ministry of State Security, and the security and intelligence services of the United Kingdom Home and Foreign and Commonwealth Offices, commonly known as MI5 and MI6, respectively.

Since the turn of the new millennium, software developments in geospatial data visualization have increased attention to location-specific information and communication for many other practical applications than national security and intelligence. A major breakthrough in geo-location enabling occurred in 2001, with the founding of the geospatial data visualization company Keyhole Inc. After Keyhole Inc. was acquired by Google in 2004, the company's most promising software development, the satellite mapping

application suite named Earth Viewer, re-emerged in 2005 as Google Earth. Other Keyhole Inc. software developments survive in Google services such as the Keyhole Markup Language, Google Maps, and Google Mobile. Since that time, given the widespread use of Web-delivered applications such as Google Earth and NASA World Wind, geospatial data and geo-locational enabling have been used extensively in a diverse array of applications and topical areas, ranging from entertainment to education.

Elections

One year after the launch of Google Earth, Google released the Google Earth Election Guide, a resource that was designed in preparation for the November 2006 elections. The Google Earth Election Guide was conceptualized and designed by Google Earth engineers who found it challenging to seek aggregated election information online. The guide provided geo-specific election information, including voter registration, voting locations, and campaign financing statistics from the Center for Responsive Politics and Federal Election Commission. An interactive element to the guide allowed users to click on each of the 435 U.S. Congressional districts that link to information and live feeds from Google Web, Image, and News Search for each district's candidates.

The years following the launch of the Google Earth Election Guide saw a vast increase in the use of Web-enabled mobile communications for political campaigning, issues awareness-raising and other political topics. A survey conducted by the Pew Internet and American Life Project reported that during the 2010 U.S. mid-term elections, 26 percent of U.S. citizens used their cell phones to find out where to vote, follow campaign developments, get polling results, and on election night, get election results as quickly as they were determined and announced.

The Pew survey also found that 12 percent of respondents reported using their cell phones to keep abreast of election news coverage, 10 percent sent texts related to the election to personal contacts, 6 percent used their cell phones to receive information about voting locations and "voting conditions," 1 percent relied on mobile delivered applications related to the election, and 1 percent made financial donations to various

Google Maps on a mobile phone in 2006, the year after the launch of Google Earth. By 2010, 88 percent of Americans who registered to vote owned cell phones, and 26 percent of U.S. citizens were using their phones to find information about voting.

political candidates and political causes through text messaging applications.

By 2012 geo-locational enabling was touted as the “game-changer” for the U.S. presidential election. Given that at the time of the 2010 Pew survey, 88 percent of registered voters in the United States had a cell phone and of those more than half were smart phones, mobile-delivered information generally and geo-locational enabling specifically offered immense prospects for political campaign strategy. Strategists used geo-location enabling to contact people within a one-to-two-mile radius of specific events like campaign rallies with targeted, mobile-delivered advertisements and candidate updates.

Privacy Concerns

With the increase of geo-locational enabled applications, privacy advocates, legislators, consumer

rights groups, the American Civil Liberties Union, and the Federal Trade Commission have called for guidelines about how online marketers, application developers, and even law enforcement authorities collect and share individuals’ geospatial data that they can retrieve from GPS-enabled mobile devices.

In August 2012, the ACLU filed a lawsuit under the Freedom of Information Act that would require the FBI to reveal its use of geo-locational enabling devices. One result was the U.S. Congress’ consideration of the Geolocation Privacy and Surveillance Act, which would require law enforcement to obtain a warrant in order to access citizen’s geospatial location data through cellphone and other geo-locational enabling device tracking.

Geotagging

Tagging is one of the defining characteristics of Web 2.0 services and platforms. Tagging techniques allow users to collectively annotate, classify, and categorize content. Social tagging systems are a mix of two standards: one based on user actions, and another based on the system architecture that defines the rules and relationships between users and resource tags. Geotagging is a feature that is presented individually to users. The users can share locations and add geolocated data to content. Adding geographical identification metadata to an information resource attaches value to the content by making it more searchable.

Geotagging is the process of adding metadata with geographical identification to content. It is also defined as a form of geospatial metadata. The geotagging process derived from global position systems (GPS), which are based on a latitude and longitude coordinates model. Thus, the positions assumed by geotagging-enabled information services stem from this pattern.

Geotagging enables the spatial indexing of content. Therefore, it is a process of recognized geographic locations that enhances the development of geographical databases, geo-referenced Web resources, and geo-referenced multimedia content. Consequently, geotagging is a practice that completely modifies how the user interacts with content and other users in digital space. Systems with geotagging features usually add to media content latitude and longitude coordinates, distance, and place names. The data added consists of textual and visual features.

Geotagging standards in electronic file formats are embedded in the information in metadata. However, for each type of media, there are different protocols to attach geospatial information because

geotag information can be read by several media systems. The main options of geotagging systems are the capture of GPS information at the time of publication or local position added by the user. Location-based services have different approaches to privacy, but most present default settings.

There are no industry standards. However, there are a variety of techniques implemented by diverse services with different purposes including to (1) propagate to friends a specific location; (2) suggest commercial and cultural information based on local position; (3) locate discount coupons for stores in the user's geographical area; (4) aggregate data for a location; and (5) provide real-time, location-based searches. There are also several other geotagging applications in different contexts and business, such as event or object recognition, geolocation, media visualization, services and products recommendations, social networking, and mapping.

The adoption of geospatial features allows tracking content or users by associating it with GPS. The presence of geographically relevant metadata can help users to find a variety of location-specific information, which generates geo-awareness across the Web repository and within computer-mediated communication. Geotagging-enabled information services can be used to find location-based resources on news Web sites, multimedia content, and other platforms. Social media platforms often present content relevant to a given location.

Geotagging systems have complex dynamics to present content-derived location information. Proximity and sibling features are the most common, and are used to present places based on geographic distance and similar places and points of interest that share a parent in a geographic hierarchy.

There are several social media platforms with tag-based systems, such as Flickr and Facebook, which enable content to be found through a location search. These platforms allow users to add metadata to an information resource in an automatic or manual procedure.

Content indexation through geographic components emphasizes the location argument. The variety of geo-enabled features allows location-based, personalized information services targeting regional publics. Mobile applications and

social platforms can benefit from the use of geographical information, which is based on a GPS and Wi-Fi triangulation. Several online services collect, provide, and analyze geo-information as a business. Geo-information is an important value for corporations, and it can be a market opportunity for business, for example, the social platform Foursquare. The business model of various mobile applications and Internet services is based on geotagging. Such features have also been the basis of the evolution of communication and interaction in the context of the social Web.

The practice of geotagging is a technique of managing information on the social Web and an example of collective intelligence that provides insight into human social structures. Technological innovation in recent years and the proliferation of the Internet, GPS devices, smartphones, and tablets suggest that the availability of geo-tagged content will continue to expand.

Get Out the Vote Drives

Political organizations often use get out the vote (GOTV) drives in an effort to increase voter

turnout in elections. These drives are carried out by a variety of political organizations, both partisan and nonpartisan. Some focus solely on voter identification and registration; others aim to mobilize these voters, getting them to cast early, absentee, or Election Day ballots. GOTV efforts have traditionally included activities like canvassing, phoning, and mailing campaign literature. In recent years, campaigns have incorporated a variety of new media strategies in their GOTV drives.

Political parties, specific campaign organizations, and other partisan groups are chiefly responsible for GOTV efforts during each campaign cycle. Especially in the thousands of local elections held each year, these organizations opt for a more personal, scaled-back approach to mobilizing voters. National elections are more likely to see increased involvement of nonpartisan organizations like Rock the Vote and the League of Women Voters. Although each organization varies in partisanship and intent, they hold some of the same goals: identify, register, and mobilize voters.

Regardless of the method chosen for mobilizing voters, the first step in a GOTV effort is always identifying potential voters. First-time voter programs and organizations like Rock the Vote identify and target young voters. Other organizations specifically target women, minorities, religious groups, and others according to a variety of demographic traits. Campaigns will typically identify several populations to target as potential voters. They may compile lists of potential voters from registered voter lists by reaching out to other organizations (e.g., churches and civic organizations), or through other means. Campaigns can then refine those lists by seeking further information on individuals. As technology has progressed, some companies have merged voter data with commercially obtained information to create comprehensive voter databases. When resources allow, campaign organizations may use these databases to reach very specific target audiences.

Donald P. Green and Alan S. Gerber found that more personal approaches to mobilizing voters are typically more successful than the impersonal. Personal interactions like door-to-door canvassing are more likely to turn out voters than impersonal strategies like prerecorded phone

calls and mass e-mails. However, each GOTV strategy has advantages and disadvantages for campaigns based on cost, time, efficiency, and available resources.

Strategies

Door-to-door campaigning is a traditional and popular form of getting out the vote. Local parties, limited in financial and other resources, still tend to favor this strategy. Canvassing may be done by volunteers, paid staff workers, allied group members, or candidates. During a visit, a canvasser talks to a potential voter and may also distribute campaign materials, such as a yard sign or pamphlet. Door-to-door canvassing is effective because it helps potential voters make personal, qualitative connections to a campaign.

However, this GOTV strategy also entails certain risks, and can quickly consume an organization's time and resources. In addition to potential weather and safety concerns facing the canvassers, a campaign risks losing control of its message through this form of voter mobilization. Untrained volunteers or representatives of supportive organizations may not be dependable messengers for a candidate's positions or a campaign's central theme. National campaigns, seeking standardization of their messages, often shy away from this campaign form because of its decentralized nature. Additionally, the time- and resource-consuming nature of door-to-door canvassing leads organizations to favor other methods that require fewer workers and less time.

Other GOTV strategies similarly engage potential voters in direct, face-to-face, personal interactions. Candidates meeting individuals at campaign events, at local stores and restaurants, and at other events and locations may be another simple way to influence voter turnout. Similarly, campaigns holding rallies, forums, debates, and seminars may also encourage voter turnout. People at campaign events are sometimes even encouraged to register or take part in early voting on the spot. Organizations may register voters, bus people to early voting locations, or direct them toward absentee ballots. Barack Obama's 2012 presidential campaign did much to encourage early voting in states like Ohio, with the candidate calling on supporters to leave his rallies and vote.

Organizations with the aim of turning out voters also frequently turn to phone banks. Less personal than door-to-door canvassing, phone calls can still be effective if the caller comes across as conversational and authentic. Meanwhile, callers who hurry through scripts are unable to make a personal connection with the potential voter and are less likely to influence that individual's decision to vote. Robocalls, or prerecorded messages from candidates or key supporters, also fail to make personal connections; however, Green and Gerber note that some voters may enjoy receiving a phone message from a favorite politician or celebrity. Robocalls can also easily be specifically tailored and sent to certain audiences. The overuse of phone calls from campaigns, telemarketers, and others make this GOTV method bothersome for many potential voters. The increased number of cell phones and decreased number of landlines, the prevalence of caller ID technology, new regulations on do-not-call lists, and other related issues make the future of phone campaigns complicated and uncertain. However, Lisa Garcia Bedolla and Melissa R. Michelson conducted an extensive experimental analysis, concluding that the use of phone banks, like the use of door-to-door and other interpersonal methods of voter mobilization, were likely to change people from low-propensity voters to regular voters.

Another traditional GOTV material is the circular, distributed either by mail or canvassing. Easier and less time consuming than having door-to-door conversations, circulars are also less likely to have great effect on potential voters because of their impersonal nature. Campaigns may choose to distribute door hangers, flyers, and pamphlets to different houses when they want to reach a wide audience in a short amount of time. Direct mail makes it easier for campaigns to target certain populations because they may send specific material to certain sets of voters.

GOTV drives also employ radio, television, and newspaper advertisements and appearances. The abundance of negative television advertisements are often designed to suppress voter turnout from those who might support a candidate's opponent. Other advertisements that highlight the importance of upcoming elections have a more positive effect in turning out the vote. A 2012 Obama campaign ad did this by recalling

the 2000 presidential race in Florida, where a 537-vote difference determined the outcome of the election. Representatives of campaigns and other GOTV organizations also appear or seek coverage from traditional media sources in order to influence potential voters. On Election Day, candidates and their families often gain media attention by voting and saying words of encouragement for the viewing audience to do the same. Obama became the first major candidate to cast his vote early in the 2012 elections, and gained media attention that day for encouraging viewers to do the same. Comprehensive GOTV campaigns also use interviews and a variety of other media appearances to communicate their messages.

Social Media

While GOTV campaigns are still reliant on long-established methods and traditional media, technological advancements are drastically altering the ways these campaigns operate. E-mail allows organizations to reach a large number of people at a very low cost. Organizations can be flexible with the content of their e-mails and can also choose how many to send out. As with direct mailings and robocalls, organizations may also send specific messages to certain target groups with e-mails. E-mail recipients can easily forward these messages to friends and families, making e-mail an even more attractive GOTV campaign form. Unfortunately for GOTV campaigns, e-mails may often be discarded as spam and junk mail by recipients or by some e-mail servers. People may not always read their e-mails, and may become annoyed by an organization's overuse of the channel.

The constantly evolving landscape of social media can also play a prominent role in GOTV efforts. First, many new media tools are used to supplement more traditional methods of turning out the vote. Phone apps have been used to help campaign volunteers register voters and participate in door-to-door canvassing. Interested viewers can watch television advertisements on YouTube and other video-sharing Web sites. Political campaigns can collect information about potential voters from Facebook and other social network sites in order to aid their micro-targeting efforts.

Campaign supporters' abilities to share statuses and updates on Facebook, to retweet messages on Twitter, and to similarly promote messages on blogs, Web sites, and other social networks is also an advantage for campaigns relying on new media. Supporters have an easy way of involving themselves in campaigns, and can easily pass along GOTV messages to those they are connected to online. It has never been easier for individuals to publicly express their support for a candidate or to encourage others to vote. Simply liking a status, sharing a video, or retweeting a comment can turn someone into an important GOTV campaign tool. Unfortunately, little research has been done concerning the effectiveness of social media GOTV efforts so far. Unfortunately also, many limitations exist on how GOTV messages might be received. A campaign is unable to control its message once out in social media—it has little control over which meme becomes popular or how people disseminate their messages. Also, while social networks continue to grow, there remains a portion of the population that is not reachable through this channel. Others on social networks may ignore or respond negatively to political messages. Finally, there are many who share privacy concerns over how campaigns may access and use their personal information. GOTV campaigns could risk alienating potential voters by using too much of their gathered data.

In summary, GOTV efforts will continue to grow and expand in numerous, unpredictable ways. Political campaigns and other GOTV organizations will continue to use social media in order to gather information and mobilize voters. Some of these ways will be entirely new, while others will supplement more traditional GOTV methods. Meanwhile, traditional methods like canvassing and telephoning will likely continue to thrive as campaigns attempt to reach potential voters with personal messages and through as many channels as possible.

GetUp.org.au

GetUp.org.au is a nonprofit Australian Web site that facilitates grassroots community advocacy. Fashioned after the U.S. site MoveOn.org, GetUp! Action Australia seeks to give average Australians the ability to have their voice heard within the Australian political scene while holding politicians accountable on issues that are important to Australians. The core functions of the organization are based on its Web site, which allows members to post petitions, virtually sign petitions, and send pro forma e-mail letters to members of parliament. In addition to its Internet-based activities, GetUp! also promotes causes important to members through participating in relevant events, releasing television advertisements and radio announcements.

As a nonprofit organization, GetUp! does not support any specific Australian political party. GetUp!-oriented campaigns are varied, and include social justice issues, economic fairness, and campaigning for sustainable environmental policies. Although GetUp! has had a significant impact on Australian politics, it has received widespread criticism for its motives and methods. Launched by Jeremy Heimans and David Madden on August 1, 2005, GetUp.org.au combined Internet advocacy with television advertisements in a bid to encourage voters to “keep the Howard Government accountable,” in reference to John Howard and the coalition government of Australia, when the Liberal-National coalition assumed control of both houses of parliament in August 2005, something that had not happened since 1981.

As their first campaign, GetUp! encouraged Australians to send e-mails to senators and representatives in the Howard coalition government to remind them that the public was watching and would hold them accountable for their campaign promises and the decisions they made while in office. Since then, the organization and its members have supported a variety of campaigns since 2005, including issues both within Australia and of international importance. It lobbied the Howard government to push the American government for the unconditional release of David Hicks (an Australian who had been detained in Guantanamo Bay after taking combat training at al Farouq, an Al Qaeda-affiliated training camp in Afghanistan); it opposed Rudd government efforts to implement Internet censorship; it took out advertisements in support of WikiLeaks founder Julian Assange; it stood against China’s treatment of Tibet; and it has spent many years campaigning for marriage equality legislation in Australia.

GetUp! does not support any particular Australian political party, taking as its goal to broadly hold politicians accountable for its decisions. While it accept donations from the general public, private organizations, unions, and community groups, it does not accept donations or funding from political parties or the Australian government. Although its campaigns have generated positive feedback from the Australian public for the impact that it has had upon governmental policy, GetUp! has garnered a significant amount of criticism leveled at its motives, questionable facts and figures, and its selective campaign processes.

In August 2005, GetUp! was criticized by Andrew Robb, an Australian Liberal Party politician, who claimed that the site was partisan because of its outspoken opposition to key Liberal Party policies and legislation. When speaking on *The 7:30 Report*, an Australian current affairs television program on the Australian Broadcasting Corporation, Robb accused GetUp! of being a front for the Labor Party, suggesting that it was not upfront and honest about its motives or political affiliation. The organization repeatedly rejected the idea, pointing to a number of its campaigns that criticized the Labor Party as well as the Liberal Party.

Following from this, Australian Special Minister of State Eric Abetz petitioned for the Australian Competition and Consumer Commission (ACCC) and the Australian Electoral Commission (AEC) to investigate GetUp! to determine whether there was a conflict of interest regarding donations and its affiliation with political parties. Abetz's petition was rejected by the AEC for a lack of sufficient evidence supporting a full enquiry.

The organization has also met criticism for the use of questionable facts and figures. For instance, GetUp! maintains that it has over 600,000 members; however, this number is questioned because anyone who signs a petition on the site is automatically considered a member, whether they have officially joined the site or not. Additionally, the membership application process is open to manipulation and falsification. In addition to claims of exaggerated membership numbers, GetUp! has been accused of overestimating attendance numbers at its rallies. At a rally for gay marriage in 2011, then Director Simon Sheikh said that there were tens of thousands of people in attendance, while police estimated that no more than 5,000 people attended. At a 2011 rally regarding the proposed carbon tax, GetUp! claimed that over 8,000 people attended, while others put the attendance at no more than 4,000.

In 2012, the group was criticized again, this time for presenting misleading facts in their No Harvey No campaign. No Harvey No campaign materials claimed that the timber used in manufacturing the furniture sold by Australian furniture retailer Harvey Norman was contributing to the deforestation of Australia's native forests. The campaign was met with criticism by both the Furniture Industry Association of Australia and then Minister for Manufacturing Kim Carr, both of whom argued that the group was discouraging people from purchasing Australian-made furniture and supporting Australian jobs, when the timber came from sustainably harvested Australian native forests.

Ghost Blogging

Political figures can use blogs to develop a personal sense of connection with supporters and engage in conversations with them. Blog readers enjoy a behind-the-scenes view from the political figure's perspective and a sense of getting to know the person. Reporters also follow political figures' blogs as sources for news. Blogs, however, are time consuming to write and require strong writing skills. Given these constraints, there is substantial debate about whether political figures should engage in ghost blogging. In the context of politics, ghost blogging occurs when a staff member writes blog posts on behalf of a political figure who is stated as the author. There is substantial debate about the ethics and effectiveness of ghost blogging.

The ethical question regarding ghost blogging is whether it should occur without a disclosure statement that explains how the blog is written. A disclosure statement could explain, for example, that the political figure shares his or her thoughts each week with a particular staff person (who would be named) for the blog, and this person writes the blog based on these conversations. The disclosure statement could also include that the political figure reads each blog post and makes it his or her own before publication, and this person responds to comments personally. The idea that a political figure would have assistance with editing a blog for grammar and spelling is not controversial because these types of changes are not considered important to the authenticity of the communication.

Although ghost blogging with disclosure is a rare practice, some politicians adopt a philosophy of radical transparency. This philosophy refers to unprecedented amounts of disclosure, and is commonly used to build trust. An example of a

radical transparency practice is a disclosure statement on a Twitter profile. Barrack Obama's Twitter profile explains that tweets written by Obama are signed "-bo."

Critics of ghost blogging without disclosure argue that there are heightened expectations for authenticity in social media; however, advocates counter that audiences today are savvy enough to believe that a political figure is not the actual author of his or her blog. T. D. Gallicano, Y. Y. Cho, and T. H. Bivins conducted a national study of 500 readers of politicians' blogs and found that a little more than half of the readers believed that a staff person drafts blog posts for politicians, about a third of the readers were unsure, and the remaining respondents expected that politicians wrote their own blogs.

The effectiveness of ghost blogging can be assessed based on whether blog readers approve of the practice. Gallicano, Cho, and Bivins asked readers of politicians' blogs whether it was acceptable for a politician to have someone else write the blog posts, provided that the content came from the politician and the politician gave final approval of the blog posts before they were published. A little less than a third of the readers of politicians' blogs expressed approval of ghost blogging, less than a quarter were not sure, and a little less than half of the readers did not approve of the practice.

Based on this research, respondents were more likely to expect ghost blogging than to approve of it. Also, T. D. Gallicano, K. Brett, and T. Hopp found in their survey of approximately 300 communications professionals that more than two-thirds of respondents thought that ghost blogging was acceptable, provided that the content came from the stated author and the stated author gave final approval of each blog post.

Alternatives to ghost blogging include having a blog that is written and publicly authored by one or more staff members of the political figure. Another option would be to use only social media that the political figure has time for, such as a microblogging site (for example, Twitter).

Gillibrand, Kirsten

Kirsten Elizabeth Rutnik Gillibrand has been New York's junior U.S. senator since the start of 2009; she replaced Hillary Rodham Clinton in that position when Clinton became secretary of state under Barack Obama. Gillibrand is a member of the Democratic Party and formerly represented the 20th Congressional District of New York in the United States House of Representatives.

Gillibrand was appointed to the Senate seat she now holds initially, according to New York law, by the governor. In 2010, she was required to run for the position in a special election, which she easily won with about 63 percent of the vote. In 2012, she was re-elected for her first full, six-year term, and in that election, Gillibrand garnered the highest margin of any New York statewide candidate in history—72 percent of the vote.

Early Career

Upon graduating from law school in 1991, Gillibrand began her practice as an associate with David Polk & Wardwell in New York. In 1992, she took leave in order to be Judge Roger Miner's law clerk in Albany in the U.S. Second Circuit Court of Appeals. Back at David Polk after her clerkship, Gillibrand represented Philip Morris

Tobacco for purposes of both the civil lawsuits involving the company and in the racketeering investigations launched by the U.S. Department of Justice. During the tenure of this representation, she was promoted to senior associate within the firm.

Gillibrand's work with Philip Morris has proven controversial for her, especially given her liberal leanings. During her representation of the tobacco interest, she also represented abused women and their children in pro bono cases, as well as tenants in lead-paint housing cases. Also during her time at David Polk, Gillibrand became a leading member of the Democratic National Committee's Women's Leadership Forum.

After leaving Davis Polk & Wardwell during the Clinton presidency, Gillibrand worked for Housing and Urban Development (HUD) for Secretary Andrew Cuomo as his special counsel. In that position, she worked on labor and new markets initiatives for HUD. She also worked toward strengthening enforcement of the Davis-Bacon Act.

Beginning in 1999, Gillibrand worked for the 2000 U.S. Senate campaign of Hillary Clinton. Her efforts on the campaign centered upon working with young women to enlist them in the campaign effort. Many of these women would later become active in Gillibrand's campaigns. Clinton became a mentor to Gillibrand during these years, and Gillibrand has personally donated to Clinton's campaigns.

In 2001, Gillibrand moved to New York's Boies, Schiller & Flexner as a partner, where she represented the Altria Group, the parent company of Philip Morris. In 2002, she moved from the Manhattan office to the Albany office and notified the firm of her interest in running for office. In 2005, she left the firm in order to launch her 2006 congressional campaign.

Public Office

Her first campaign in 2006 was against John Sweeney, a four-term congressman and member of the Republican Party. The 20th Congressional District in New York was traditionally conservative and had elected almost exclusively Republican candidates since 1913. Sweeney himself had been quoted asserting that the Republican Party could never lose the 20th District. During this race,

Gillibrand ran on the Democratic and working families party lines; Sweeney ran on Republican, conservative, and independence party lines. The Republican Party had an advantage of more than 82,000 enrolled voters at the outset of the campaign. During a race that saw Gillibrand stand somewhat more to the right on certain issues than she would later do, and that saw Sweeney accused of domestic violence, Gillibrand eventually won. Gillibrand was also reelected in 2008 when she was challenged by former secretary of state for New York Sandy Treadwell. Gillibrand won by a margin of 24 points, significantly more than in 2006.

At the outset of her congressional tenure, Gillibrand published her official schedule for each day, including who she met with, alongside her personal financial statement and all earmark requests she made. Gillibrand called this dossier of information the Sunlight Report, and she was the first member of Congress to publish such a statement. During her first year in office, Gillibrand opened the earmarking process to the *New York Times*. Also, during her years in Congress, Gillibrand voted against the Immigration Reform Act of 2007 and the Wall Street bailout proposed by George W. Bush.

In December 2008, Barack Obama chose Hillary Rodham Clinton, then New York's junior U.S. senator, to fill the role of secretary of state. When she accepted, the duty of appointing her replacement fell to Governor Paterson of New York—an appointment that by law would be followed by a special election in 2010 for the duration of the full term. Paterson chose Gillibrand in January 2009 after she lobbied for the position, among others. She was 42 years old when sworn in that month and was thus the youngest senator in the 111th Congress.

Once she was appointed to the Senate, Gillibrand's positions reflected the more progressive bent of New York State as a whole, compared to her more moderate positions for her representation of the conservative 20th District. On April 9, 2009, Gillibrand, along with Chuck Schumer, issued a press release lending strong support to the nomination of a Latino to the Supreme Court upon the next vacancy. They proposed their first choice, Sonia Sotomayor, and introduced her at the July Senate confirmation hearing.

Senator Kirsten Gillibrand drew the ire of Internet freedom activists when she cosponsored the Stop Online Piracy Act (SOPA) and Protect IP Act (PIPA) bills. These protestors stood outside of Gillibrand's office in New York City on January 18, 2012.

Before the special election in 2010, Gillibrand faced only Gail Goode, a New York City lawyer, in the primary and won easily with 76 percent of the vote. In the 2010 election, Gillibrand faced former congressman and Republican Joseph DiGuardi. Although the election was at the outset predicted to be a close race, in the end Gillibrand took 54 of the 62 counties in New York. Those counties that Gillibrand lost were carried by DiGuardi by margins of 10 percent or less. This was her first statewide election, and it gave her the Senate office until January 2013.

Gillibrand was a supporter of the James Zadroga 9/11 Health and Compensation Act and fought to repeal the “Don’t Ask, Don’t Tell” military policy. These were probably her two most notable achievements during this latter half of the 111th session. In the aftermath of the 2011 shooting of Congresswoman Giffords in Tucson, Arizona, Gillibrand visited Giffords in the hospital. The two were friends, and Giffords opened her eyes for the first time during the visit.

In 2011, the *National Journal* announced that Gillibrand, tied with Jeff Merkley, was one of the two most liberal members of the U.S. Senate. Only one year earlier, in 2010, the *National Journal* ranked her 10th, tied with Chuck Schumer. In early 2012, Gillibrand was the cosponsor of the Protect IP Act (PIPA), a controversial piece

of legislation intended to fight theft of intellectual property and illegal downloading. IPA was attacked by many critics and free-speech scholars who argued that it allotted far too much censorship power to the federal government. Ultimately, PIPA and its counterpart in the House, the Stop Online Piracy Act (SOPA), were stopped.

Gillibrand has been an advocate for educational reform and received an “A” from the National Education Association (NEA). She voted in favor of expansion of the Head Start program and opposed vouchers for private schools, instead advocating for better public-school funding. Gillibrand authored the Keep Our Educators Working Act, which didn’t get past the committee stage, and also the Undergraduate Scholarships Awards in Science, Technology, Engineering and Mathematics Act (US STEM), which made it to committee. US STEM would award 2,500 full-tuition grants to undergraduates through the National Science Foundation (NSF) for their last two years of school. Gillibrand also voted to reform the No Child Left Behind Act. Gillibrand supported numerous other educational initiatives and increased funding for Pell Grant scholarships.

2012 Election

In the 2012 election, Gillibrand was challenged by Republican Wendy E. Long, an attorney. Long also ran on the Conservative Party platform, while Gillibrand ran on the Democratic platform with the backing of the *New York Times* and the *Democrat and Chronicle*. The 2012 election was a major victory for Gillibrand, who took 72 percent of the vote—the largest margin of victory in the history of New York.

Gillibrand is a liberal, particularly in the realm of social issues. At the end of 2012, she supported same-sex marriage and gun control, receiving a 0 percent rating from the NRA in 2012. In the area of health care, Gillibrand supported reform, a public option, a Medicare-for-all system, and publicly funded abortion. An ongoing advocate for transparency in government operations, Gillibrand continues to publish significantly more financial, personal, and scheduling information than most of her peers. In 2012, Gillibrand was rated 8 percent by the American Conservative Union and 90 percent from the American Civil Liberties Union (ACLU).

Social Media Use

Kirsten Gillibrand is known in part for her social media presence. With nearly 55,000 followers and a Klout score of 85 (ranked 14th in the Senate), she has a considerable online presence. Social media is of special import to the Gillibrand campaign and office because, as a very liberal Senator, her constituency is younger than average in the United States. Social media use among voters increases as age decreases, so maintaining an active online profile is crucial for Gillibrand's reach toward the voters who will support her issues.

As the StarCount page on Gillibrand demonstrates, in any given day, there will be several Facebook posts and tweets on her profiles. Gillibrand also maintains a YouTube channel and liberally posts her video appearances. This works especially well for her, given that her appearance and attractiveness are common topics of discussion among her peers and in the media. According to Socialbakers, Gillibrand gains approximately 700 fans on Facebook each month.

Glee

The Fox Network musical comedy *Glee* is an example of the successful integration of old and new media and the use of social media to sell mass media to younger generations. From its debut in the fall 2009 season, *Glee* has supplemented its marketing with social media aimed at reaching a target audience of teens and young adults.

The network has innovated and popularized new media tactics, including cross-platform loyalty games that reward points for fan activity on different networks including Facebook, Twitter, and Myspace. This type of integration leverages television viewers' increasing preference for using multiple screens at one time, rather than focusing on a single activity. Created by prominent television writer and outspoken gay rights advocate Ryan Murphy, the program is also notable for its self-conscious social commentary and equitable depictions of a gay teenage romantic relationship in a way that parallels its portrayal of straight couples.

Television Audiences and Social Media

Glee's integrated old and new media strategies exemplify best practices in response to larger trends. Cross-platform media use has become increasingly common, according to the Pew Internet and American Life Project. In 2012, 20 percent of Pew survey respondents said that they had visited a Web site that they had seen mentioned on screen. An even larger proportion, 38 percent, reported using their mobile phones during commercial breaks. Rather than suffering the ongoing loss of viewers and divided attention, this type of social marketing engages TV viewers, using on-screen prompts that invite them to join real-time online discussions about the show on the most

popular social networks, take polls, answer trivia questions, and check into the experience via apps like Foursquare and GetGlue. As a result, rather than losing the audience to competing media, while people are watching *Glee*, they are interacting with a community of fellow fans (or even antifans) and other people watching on a variety of connected devices from mobile phones to laptops and iPads. In one contest, *Glee* fans vie to be named Gleek of the Week, a title that comes with on-air and online recognition. In 2011, *Glee*'s creators employed a similarly integrated campaign to successfully launch the competition spin-off program *The Glee Project* on an even greater number of social media networks, including Tumblr, Facebook, Twitter, and GetGlue.

Global Center for Journalism and Democracy

The Global Center for Journalism and Democracy (GCJD) promotes the free press by working with journalists, governments, organizations, and associations to foster healthy working "... relationships. Being housed within the Mass Communication department at Sam Houston State University,

the Center offers training programs for journalists at all levels, from students to citizen journalists and beat reporters. GCJD staff, and its partners," according to the Center Web site, "... also work with political parties, law enforcement officials, corrections officers and civil organizations in an effort to assist them in understanding the role of the press in a civil, democratic society, and how to develop more effective and productive communication relationships with mass media."

Founded at Sam Houston State University (Huntsville, Texas) in 2012 by former CNN justice correspondent Kelli Arena, the Global Center for Journalism and Democracy the mission statement for the Center is to "... provide resources and training to journalists from around the world, in addition to working with governments, organizations and associations to help them better understand the role of journalists and how to build better working relationships with the press." Additionally, the GCJD offers specialized training programs for journalists across a range of topics, including: interactional and criminal justice, gender equity, health, politics and elections, energy issues, and public health concerns. The GCJD also offers specialized assistance and mentoring for female journalists and journalists in areas of conflict.

The global training activities of the GCJD are also used as a means of providing opportunities for Sam Houston State University mass communication students to travel, gaining both international and training experience. In addition to the travel opportunities available through the GCJD, the center also offers students internship opportunities. Additionally, as part of its mission to foster healthy press relationships on a global scale, the GCJD brings international journalists and experts across a range of topics to the campus to speak to students about issues related to press freedom, and political and controversial issue reporting.

The GCJD has developed working partnerships with a range of organizations, including: the National Democratic Institute, Samir Kassir SKeyes Center for Media and Cultural Freedom in Beirut, and UPI Next. In addition to offering training, the GCJD is committed to identifying appropriate cutting-edge communication technologies that can help journalists communicate in complex situations. The organization promotes the use of social media platforms like Facebook,

Twitter, and YouTube as useful tools for journalists to share information, even in situations where communication is difficult.

Global Voices

Global Voices is an online community of over 800 volunteer authors and part-time editors who aggregate, translate, and amplify the online work of citizen journalists from around the globe. Global Voices is different from citizen journalism sites like Ground Report and Indymedia because it does not post first-hand accounts. Instead, its editors and authors aggregate, contextualize, summarize, and link to first-hand accounts found on Web sites, blogs, microblogs, podcasts, and online videos. Global Voices focuses on stories from countries other than North America and Europe, especially developing countries. Often, stories from these countries receive little or no coverage in international mainstream media, and Global Voices seeks to change that. Global Voices' primary goals are to call attention to important stories by citizen journalists to facilitate citizen journalism by providing needed training and tools and to advocate for free speech around the globe.

Global Voices was founded in 2005 by Rebecca MacKinnon and Ethan Zuckerman while both were fellows at the Berkman Center for Internet

and Society, a Harvard University research center. The idea for Global Voices grew out of an international blogger's conference in 2004 at Harvard. Before joining the Berkman Center, MacKinnon was the Beijing and Tokyo bureau chief for CNN. Zuckerman helped found Tripod.com, an early online community Web site, and Geekcorps, a nonprofit that sent Internet technology experts to help companies in developing countries. Zuckerman, now the director of the Center for Civic Media at MIT; and MacKinnon, now a fellow at the New American Foundation in Washington, D.C., both remain on the Global Voices board of directors.

The Global Voices community consists of a board of directors, a group of advisors, project directors, part-time editors, and volunteer authors. The group of advisors is made up of activists, technology experts, and writers, including technology journalist Xeni Jardin and John Palfrey, the director of Berkman Center. The day-to-day work is handled by the management team of project directors, editors, and authors. Project directors lead special projects, for example, in free speech advocacy and citizen journalism training. Subject editors manage stories related to such subjects, for example, sports. Regional editors manage stories from nine regions, ranging from the Caribbean to sub-Saharan Africa. Language editors work with volunteer authors to translate stories from their respective languages into English.

Lingua editors work with a group of more than 600 translators to then translate English-language stories into various other languages. Volunteer authors, who often blog about events in their countries, serve an important role. Many help bridge the gap between cultures. Most blogging is done intraculturally, written by a member of a cultural group for other members of that cultural group. What allows Global Voices to work well are bloggers who work interculturally; they write about what is happening in their culture for an outside audience in the language of the outside audience. For example, a Chinese blogger in China will write in English for his or her audience in English-speaking countries.

Before a news story appears on the Global Voices Web site, there is a process. The process begins with a news event in a country, for example, a national revolution or a sporting event. Citizen

journalists in the country blog, tweet, and post video about the event. Volunteer authors, and Global Voice editors, monitor the posts, aggregate, summarize, link to first-hand accounts, and post the stories in English on the Global Voices site. Interested readers can access the stories via RSS feeds, e-mail, Twitter, or Facebook. Lingua editors may select some of these stories for translation into other languages.

In addition to the Global Voices Web site that calls attention to citizen journalism from around the world, Global Voices has other Web sites and projects that address other goals. The Raising Voices project addresses Global Voices' second goal, to provide citizen journalism training and tools. Raising Voices, launched in 2007, aims to empower underrepresented communities by awarding microgrants, developing tutorials on citizen journalism, and cultivating a network of citizen journalism activists. The Global Voices Advocacy project addresses Global Voices' third goal, to advocate for free speech around the globe. The advocacy project seeks to raise awareness about online freedom of speech issues, including censorship by governments. The project also maintains databases of past and current abuses of online rights around the world.

In a 2012 article by Zuckerman, he laments that while Global Voices has gained recognition, it has had "only modest success" in gaining an audience. The truly interconnected, postnational world has not come about as predicted. The Internet greatly aids in communication, but as Zuckerman notes, Internet users often communicate online with people they already know in their community. Zuckerman's research shows that 95 percent of the news consumed by Internet users in the United States is published in the United States. To push for a more interconnected world, Zuckerman calls for designers of the next generation of online tools to help connect disparate voices from around the world. As Zuckerman notes, Facebook notifies users when they have not friended a high school classmate; Facebook and other social media companies could possibly connect people to new friends on the other side of the globe.

Global Warming and Climate Change

The term *global warming* refers to the gradual increase of the average temperature of the Earth's atmosphere and oceans. It is an expression of seasonal changes in the weather patterns of the Earth as a whole or of its individual regions, which lead to a statistically significant deviation in the values of long-term weather parameters. The periods of reference for climate change range from decades to millions of years. Most frequently, the term *global warming* is used in reference to the phenomenon observed in the 20th and 21st centuries. The term *climate change* is used in narrow and wide senses. In its narrow sense, it refers restrictively to climate change taking place in the present, and in this use, it is synonymous to global warming. In the wide sense, it also includes the phases of global cooling and changes in precipitation patterns. The United Nations Framework Convention on Climate Change (UNFCCC) uses the term *climate change* in its narrow sense and mainly in reference to anthropogenic climate change, reserving the term *climate variation* for climate changes generated by natural causes. In some cases, in order to refer specifically to climate change caused by human activity, the term *anthropogenic climate change* is used.

In referring to climate change and global warming, politicians and the media often use the scientific data or explanations and hypotheses supplied by scientists in order to support a

political stance on the problem. The scientific approach to climate change must consider issues relevant to many different scientific fields, such as meteorology, physics, oceanography, chemistry, astronomy, geography, geology, and biology, as well as many interdisciplinary branches. The issues related to climate change have profound influences on society, which mainly confront its economic and political aspects.

According to scientific assessment by the Intergovernmental Panel on Climate Change (IPCC), supported by the national academies of science of the Group of Eight, the average temperature on Earth has risen by 1.26 degrees Fahrenheit (0.7 degrees C) since the beginning of the Industrial Revolution in the middle of the 18th century, and a large proportion of observed climate warming over the last 50 years is attributable to human activities, specifically the emission of gases such as carbon dioxide (CO₂) and methane (CH₄), which causes the greenhouse effect. According to the Natural Resources Defense Council (NRDC), the United States is the largest source of global warming pollution because with only 4 percent of world's population, it produces 25 percent of the carbon dioxide pollution from fossil fuel burning, thus emitting more carbon dioxide than China, India, and Japan combined.

Estimates obtained from the climate models in the IPCC Assessment Report of 2007 indicate that by the beginning of the 22nd century, the average global temperature of the Earth's surface might rise by 3.24 to 6.12 degrees F (1.8 to 3.4 degrees C), with a possible slight decrease of temperature in some regions. In addition to the rise of sea level, the increase in global temperature will cause changes in the amount and distribution of precipitation. This might result in an increased frequency and magnitude of natural disasters such as floods, droughts, and hurricanes. Among other possible consequences of the increase in global temperatures is the decrease of crop yields in the less-developed countries of Africa, Asia, and Latin America; and increased yields in developed countries because of the increase in carbon dioxide concentration and longer growing seasons. The warming of the climate will probably lead to a shift in the areas populated by plant and animal species toward the polar zones, and increase the probability of

extinction of indigenous species of the coastal areas and islands that are now endangered.

However, some scholars believe global warming to be a myth, whereas some researchers recognize climate change, but reject the possibility of human influence on this process. There are scientists who do not deny the fact of warming and its anthropogenic nature, but do not agree with its particular aspects, such as the notion that the greatest impact on climate results from industrial emissions of greenhouse gases.

Global Warming and Traditional Media

Over the past five years, global warming has consistently been one of the most debated and divisive subjects in social media, particularly in the blogosphere. However, the importance of media in developing public awareness and concern with global warming and climate change has been evolving over the decades. Global warming began as a topic of scientific inquiry in the 1960s, but it was not widely recognized until the 1980s, the warmest decade on record, when serious journalistic and political interests were drawn to the weather conditions and climate. Journalists reporting on global warming and related issues cultivated the growth of public awareness. A study found that in 1981, only 38 percent of Americans had heard of global warming; by 1987, this number increased to 41 percent; and by 1990 to 86 percent. Another study examined opinion trends in global warming in the past 20 years, and found a strong correlation between patterns of media coverage of global warming and changes in public opinion concerning the issue. The connection is clearest between media attention and public awareness of global warming as a problem. In 1990 and 1992, two large groups of scientists received prominent news coverage when they petitioned President George H. W. Bush to take action to prevent global warming.

The issue of global warming received renewed political impetus in 2006 from the documentary film *An Inconvenient Truth*, directed by Davis Guggenheim, featuring former U.S. Vice President Al Gore's campaign to educate citizens about global warming via a comprehensive slide show. The creators of the film do not intend to provide new or previously unknown information, but rather to popularize scientific knowledge that was

previously established by scholars. In the film, Al Gore explains in accessible terms the anthropogenic aspects of climate change that are commonly believed among scientists, as well as the scientific and political aspects of global warming and its consequences in the near future if the carbon dioxide emissions caused by human activity are not limited. The film also contains a narrative of Gore's life. His story about the tragic death of his sister, who was suffering from cancer, serves as a metaphor for the possible fate of humanity if the short-sighted exploitation of nature continues. *An Inconvenient Truth* was first released in New York and Los Angeles on May 22, 2006, and by November, its revenues exceeded \$20 million, which is unusual for a documentary. The film received many accolades, including the 2007 Academy Award for Documentary Feature. In the same year, Al Gore was awarded the Nobel Peace Prize (together with the IPCC) for studying the effects of global climate change caused by human activity and the development of measures to prevent them.

Global Warming and Social Media

The rapidly developing social media of today provide more options for social marketing campaigns aiming at the promotion of the awareness of global warming and climate change. Social media have been widely used in dealing with questions of climate change, global warming, and related issues as a platform for both information exchange and opinion dissemination. They serve as a main platform in debates between climate change believers and skeptics. The engagement of the social media in this and many other polarizing issues can be explained by the perceived grassroots nature of social media that stand in opposition to mainstream media because the powers that be presumably have less control over the former. Social media are also a very flexible and fast means for disseminating an idea and gathering supporters. The powerful means offered by social media are used by both nonconformist environmental activists and well-established environmentalist groups such as Greenpeace.

In some instances, social media can stand in opposition to mainstream media, such as when the traditional media become more skeptical toward the theory of anthropogenic global warming,

while social media keep proliferating with a variety of opinions and calls for action based on the recognition of global warming as a human-generated phenomenon. This divergence between mainstream and social media about global warming may reflect the shifts in public opinion in the larger context of growing skepticism toward both authorities and U.S. environmentalists, who have suffered several devastating losses in their decades-long political struggle against global warming. Lack of progress in domestic legislation to cap greenhouse gas emission found its external expression in the lack of political will of the United States in the world arena. In May 2012, the United States, together with Japan, Russia, and Canada, indicated that it would not sign a second period of the Kyoto Protocol to the UNFCCC, an international treaty that sets binding obligations on industrialized countries to reduce emissions of greenhouse gases.

In light of their failing diplomatic and legislative efforts, U.S. environmentalists try to refocus on grassroots activism that lies at the core of social media, thus making the latter an important medium in their environmental efforts. One of the most prominent examples of a successful implementation of social media in spreading the message of anthropogenic climate change and campaigning against global warming is 350.org, an international environmental organization with goals to build a global grassroots movement that raises awareness of anthropogenic climate change, to confront climate change denial and cut emissions of one of the greenhouse gases, carbon dioxide, in order to slow the rate of global warming. The mission statement of 350.org reflects the role of social media: "to organize in a new way—everywhere at once, using online tools to facilitate strategic offline action." 350.org positions itself as a science-based, single-issue organization. It takes its name from the research of Goddard Institute for Space Studies scientist James E. Hansen, who posited in a 2007 paper that 350 parts-per-million of CO₂ in the atmosphere is a safe upper limit to avoid triggering catastrophic climate change.

350.org emerged after the environmentalist author Bill McKibben and a group of Middlebury College graduates organized the 2007 Step It Up campaign directed to climate protection, where they collaborated with existing environmental

organizations such as Greenpeace. The campaign was conceived as the “first open source, web-based day of action dedicated to stopping climate change” and proved to be successful in reaching a wide audience. On April 14, 2007, tens of thousands of Americans held simultaneous rallies in some 1,400 places across the country, telling Congress to “step it up” and reduce carbon emissions 80 percent by 2050.

After the success of this campaign, 350.org was created. Since then, it has been active in an established Web presence and social media. Social media such as Skype, chat, and text messaging, as well as previously established activist networks such as change.org, were essential in organizing the International Day of Climate Action on October 24, 2009, in the wake of the 2009 United Nations Climate Change Conference, commonly known as the Copenhagen Summit. The group 350.org claims to have mobilized over 5,200 actions in 181 countries.

In the wake of the Copenhagen Summit of 2009, another social media-driven event with strong political repercussions occurred. An unknown hacker attacked a server of the Climatic Research Unit (CRU) at the University of East Anglia (UEA), which led to surfacing of thousands of computer files, including e-mails pertaining to scientific aspects of climate change. This leak was immediately popularized by climate change critics on their blogs that named the event Climategate. According to the critics of the global warming issue and deniers of anthropogenic climate change, the spilled files contained e-mails evidencing that global warming was a scientific conspiracy in which scientists had allegedly manipulated climate data with the purpose of suppressing critics. These accusations were rejected by the CRU, which stated that the e-mails had been taken out of context and merely reflected an honest exchange of ideas. Both mainstream and social media were actively involved in covering the

A Boston-area group creating one of 350.org's approximately 5,200 actions that have spread to 181 countries, largely through an extensive social media presence. This event was organized by Occupy Boston's Climate Action, Sustainability, and Environmental Justice Working Group; its protestors filled the bandstand on Boston Common on May 5, 2012.

story, which had an impact on the development of the negotiations over climate change mitigation in Copenhagen. In response to the controversy and to its development in the media, U.S. scientific organizations released statements reaffirming the scientific consensus that global warming is a growing threat to society. Rapidly evolving social media, with its mobility of information exchange, increasing accessibility, and attentiveness to current events will continue to play a major role as a communication and action platform for different opinions concerning the issues of global warming and climate change.

Going Viral

Much like the viral spread of diseases, when something goes viral, it spreads throughout a population very quickly in near-exponential fashion. The viral phenomenon is made possible when a piece of information can be replicated, reproduced, or spread by individuals to other individuals. The advent of the Internet has led to the use of “viral”

to describe the rapid spread of nonmaterial entities through communicative channels. Information can spread via a directed or broadcast message system, meaning that one can send the information to a group of designated people, or simply post the information to a location that many other people can access. In either case, a piece of information can very rapidly spread through entire populations of people. The viral spread of information was catalyzed by the increased use and speed of information and communication technologies (ICT). Many forms of information have been able to go viral, from videos to rumors, and the speed at which people can access and share information via ICTs is directly related to the speed by which something can go viral.

The phenomena known as “going viral” is, at its core, an element of social networks. A social network is a series of individuals connected to each other via some phenomena, which can be material or nonmaterial. Because people are connected to other individuals in their social networks via several different forms of media, there are many channels through which information can spread to reach other people. Additionally, social networks tend to overlap, so there are redundant ties or connections to other people. When an individual shares information with other people or posts something to a publicly viewable Internet site, that piece of information can then diffuse through the social networks of anyone who has access to the information. Tony Sampson has discussed the spread of information through networks as a form of contagion, and expresses the deep connection between the connected age and network contagion.

Preferential attachment and information cascades are two of the ways that a piece of information can go viral. Some analysts have discussed preferential attachment as a rich-get-richer type of phenomenon, where the more popular the information becomes (e.g., how frequently an online video is viewed), the more likely that information will continue to become more popular or go viral. The trajectory of the original popularity can stem from a number of sources. One such source that has frequently been the start of something going viral is when an opinion leader, such as a famous or important public figure, draws attention to some form of information, which then can

be extensively shared through social networks. Once the information begins to attract increasing attention, it can then appear as most viewed or trending on a particular Internet site, thus attracting increasing attention.

Information cascades, on the other hand, don't necessarily require an opinion leader to start the viral spread of information. Duncan Watts explains information cascades in that anyone can be a key player in a cascade because anyone can be connected to others who are willing to be influenced, and with the ease of sharing information via ICTs, the threshold of willingness can be fairly low. In a social network, each person has a set of connections that they pay attention to and a set that pays attention to them, and this variability is important for something to go viral in an information cascade.

One form of ICT that has amplified the speed at which something can go viral is social media. Social media allow people to share information with a large group of other individuals very easily; social networking Web sites support the sharing of information with one's social network, where microblogging and social tagging Web sites allow for a more broadcast form of propagation. Further, the richness of social media allows users to either share or embed media-rich artifacts such as videos very easily. As a result of the ease of sharing a variety of media with anyone who is connected to the Internet, information can go viral very quickly.

Although there are several ways that information can go viral, the predictability or creation of viral phenomena remains one of its most elusive characteristics. Unexpectedness is one of the trademarks of the viral spread of information, and as such, there has been little success in forcing or harnessing the ability to go viral.

An example of a video going viral is the "Kony 2012" video, which was viewed 34 million times on the first day that it was uploaded, and 94 million times within eight months.

Google AdWords/ AdSense in Campaign Strategy

AdWords is a Google service for buying advertisements that are placed on Google or other sites in Google's content network. One of the company's major revenue streams, AdWords brought in the bulk of Google's \$42.5 billion income in 2012.

AdSense, Google's contextual advertising program, matches advertisers in the Google Display Network (GDN) with consumers based on their search keywords and phrases. Unlike traditional advertising in which advertisers pay a flat fee regardless of whether or not viewers see ads, and hope for exposure to those who happen to come across their Web site while searching for something, however related or unrelated, contextual advertising is a type of targeted advertising that displays ads relevant to users' interests.

AdSense differs from AdWords in that, while advertisers pay to run their ads through AdWords, Web site owners/publishers with an AdSense account do not. Rather, Google pays AdSense account holders for each click originating from its Web sites.

When people visit AdSense-activated Web sites they see square- or rectangular-shaped advertisements deemed relevant to their interests, usually located on Web sites' sidebars or at the bottom of blog posts. Ad content is controlled by several criteria, including the geophysical location of the person visiting the Web site and users' individual browsing histories.

Web site owners apply for an AdSense account for their site(s). Upon approval by Google, a

“pay-on-performance,” or “pay-per-click,” agreement is instituted, whereby Google compensates AdSense account holders for the number of clicks placed on GDN advertisements appearing on owners’/publishers’ Web sites. Once AdSense account holders determine the types of GDN ads they would like displayed on their sites, a Javascript that routinely finds and displays GDN advertisements determined relevant by account holders is added to their sites’ HTML code. Through an Internet Protocol address exclusion, holders can exclude specific GDN advertisements, topics, individuals, or organizations they consider unfavorable to their sites. Thereafter, GDN advertisements, in the form of text, image, video, or rich media, appear on Web sites enrolled in AdSense. Account holders track performance statistics on AdSense’s Web site.

Use of AdWords and AdSense for Elections and Issue Advocacy

Although AdSense was launched in 2003, it wasn’t until the lead-up to the 2008 elections that many political campaign strategists discovered its potential. By late 2007, political strategy bloggers called AdWords and AdSense the “new political battle field.” Perhaps the most intense battle occurred shortly before election day in November 2008, when numerous Web sites that had no connection to politics or marriage equality debates were inundated with AdSense-generated ads encouraging voters to vote for Proposition 8, which would eliminate the right for gay couples to marry in California. Responding to objections by Google users and equality advocates, Google’s founder, Sergey Brin, CEO Eric Schmidt, and other Silicon Valley illuminaries took out a full-page ad in the *San Jose Mercury* newspaper urging readers to vote no on Proposition 8. The following week, on the company’s public policy blog, the Google Elections and Issue Advocacy Team attempted to defuse the “Prop 8 AdSense debacle” with a reminder of Google’s political advertisement policy.

The policy requires political ads to meet the same editorial guidelines as all other AdSense advertisements: no copyright violations, and no promotion of violence against anyone or advocacy against a protected group (including, but not limited to, ethnic or national origin, sexual

orientation/gender identity, or veteran status). The policy articulated Google’s commitment to fairly promote advertisements for all political candidates regardless of political affiliation or viewpoint. The policy also necessitates statements that donations for political candidates or parties are not tax deductible; forbids misleading ads, such as those claiming to be for an opposing candidate; and prohibits attacks on candidates’ personal lives.

Policy Challenges, Surges, and Negative Campaigning

Google’s political advertising policy has been challenged on several occasions. An example involving issue advocacy emerged in May 2011, when Google cancelled the AdWord advertisement purchased by the Dublin-based sex worker rights group, “Turn Off the Blue Light” (TOBL). Erroneously assuming that TOBL’s AdWord purchase was for “selling adult sexual services,” Google rejected the purchase, saying that it was an “egregious violation” of its advertisement policy. Although TOBL responded to clarify that the ad was to raise awareness about sex worker rights, Google didn’t budge. Two months later, TOBL members organized a protest at Google’s European headquarters in Dublin, after which time Google conceded, and after determining its content to be advocating a political position, ran TOBL’s advertisement.

The following year, during the lead-up to the July 12, 2012, byelection for the state seat of Melbourne, an upstart political party in Australia made a formal complaint to the U.S. Department of Justice (DOJ) against Google. Invoking the DOJ’s Foreign Corrupt Practices Act, the Australian Sex Party claimed that Google engaged in “unlawful interference in the conduct of a state election in Victoria with corrupt intent.” The complaint was lodged after the Australian Sex Party’s AdWords account application was rejected by Google on the grounds that the party’s Web site neglected to exhibit language regarding its tax-exempt status, which was required in order to solicit donations.

The party amended the Web site to include the required language; however, Google continued to ban its advertisements. On the eve of the election the party’s ads were reinstated, likely the

result of media reports that the party was planning on taking Google to U.S. federal court.

Despite the protection of Google's political advertisement policy, some strategists are concerned about the vulnerability to negative campaign tactics from their opposition because even the appearance of an opponent or a competing cause would be problematic to a political campaign. This is particularly the case with a strategy known as a Google Surge, Google Blast, or Network Blast, a large marketing expenditure that aims to create a substantial amount of targeted short-term advertising, "the Google equivalent of putting a campaign sign in every yard in the city," as stated by Cristian Guasch. The first widely reported political campaign surge occurred in March 2009, just before a special election for New York's 20th Congressional District. Democrat Scott Murphy's campaign ads flooded AdSense-enrolled Web sites targeted to his district's voters.

Surges are also used for issue advocacy. For example, the *Daily Kos* launched a weeklong surge campaign calling attention to the "cronyism and hypocrisy" in the hiring of 26-year-old Republican aide, Valerie Cass. On February 7, 2011, Cass, identified by Alysia Hopper as the mistress of her husband, Wisconsin State Senator Randy Hopper, was hired on the recommendation of Wisconsin Governor Scott Walker's cabinet, at a 36 percent raise compared to her predecessor. Four days later, claiming that the state was broke, Walker released his budget repair bill that enacted major layoffs, cut benefits, and eliminated nearly all collective bargaining rights for public workers.

Some political campaign strategists avoid AdSense, arguing that it is confusing at least, damaging at worst, if a problematic GDN advertisement would appear on their campaign sites. Further, they suggest that AdSense revenue is not worth the potential exposure to unfavorable messages. Such strategists prefer the relative control of buying and placing AdWords ads. Nevertheless, AdWords ads may appear on sites disagreeable to strategists. For example, a John McCain campaign strategist reported that a 2008 AdWords purchase resulted in McCain ads featuring the statement, "Surrender Is Not an Option on Iraq" to appear on the *Daily Kos*, resulting in negative impact to the campaign. In the following election

cycle, Mitt Romney's ads appeared on Gay.com and PlanetOut, to the dismay of his strategists.

Googlearchy and Politics

As the Internet has continued to grow in usage and capability, political scientists have hypothesized that the ready availability of news would lower the cost of political information and reduce inequalities of attention for less-attentive Americans. Computer scientists, on the other hand, believe the opposite. Their research has suggested that the Internet is actually antiegalitarian. Rather than equalizing opportunity, there is instead a winner-take-all power distribution, where a very small number of popular sites

receive a disproportionate share of traffic. In a departure from this general paradigm, however, political scientist Matthew Hindman, in *The Myth of Digital Democracy*, writes about the idea of Googlearchy. Hindman argues that there is a strong search engine bias that directs Internet users to certain sites far more often than others. Hindman bases his work on a large survey of political content available online. His study uses “iterative crawling away from political sites easily accessible through popular online search tools, and it uses sophisticated automated methods to categorize site content.” He finds that, in every category examined, a small handful of Web sites dominate. While the Internet may lower the cost of finding some information on a topic, it actually limits the impact of the vast majority of political Web sites. In short, the Googlearchy determines what one is exposed to.

The Myth of Digital Democracy was published in 2008 by Hindman, and contends that the belief that the Internet is democratizing politics is wrong. He focuses on two main myths: that the Internet has extended political voice to previously voiceless precincts, and that it has facilitated deliberation. To examine his points, he focuses on five careful categories of limits of online politics in the American context. First, Hindman’s research reminds readers that political traffic is only a miniscule portion of Internet usage. He points out that pornography has well over 100 times more Internet traffic than political Web sites. Second, Hindman points out that the link structure of the Internet limits what citizens are exposed to. Users are taken to the most popular sites, which tend to only link to themselves or to other equally popular sites. Third, search engine use is particularly shallow. Consumers are taken to the most familiar sites, rather than those that are best or the most relevant. Further, sites are able to purchase the ability to be listed higher through search engine optimization or paid ads. Fourth, Hindman discusses the expense of digital content. While it is relatively cheap to have an online presence, successful marketing, capacity, and software development are all quite costly. As a result, those who have been on the Internet the longest tend to dominate. Fifth, social hierarchies quickly emerge. Once someone is established as a blogger or subject expert, he or she quickly gains near monopoly power.

Googlearchy and the Average Citizen

Hindman argues that people actually have a significantly smaller public sphere on the Internet. When the digital world narrows political discourse, it results in Googlearchy. Hindman is not a hopeless optimist who believes that the Internet has the capability of entirely transforming governance. Instead, he notes that the average American is far more likely to check the weather or a sports score than to closely follow politics. This, Hindman argues, is caused by the inability of search engines to return rich, flavorful political Web sites that are less well known or regarded by search engine optimizers. Political blogs are huge on the Internet—especially ones related to American politics. Yet, the only way to find them is typically from word of mouth. These blogs thrive because of the boring and editorially narrow foci of mainstream American media.

Even if an average citizen happens to stumble upon a provocative blog online, odds are that it is written by someone with an advanced degree and trained under the traditional institutions of media. The top 30 blog sites (measured by daily hits), for example, are dominated by those who have advanced degrees from elite educational institutions, even more so than was true a decade ago. Hindman shows that only about a third of op-ed columnists have advanced degrees, whereas 75 percent of the top 30 bloggers have advanced degrees. The powerful drive even the allegedly egalitarian Internet. Whether these sites are the best at what they do is a different question, but people keep coming back to them. Part of the reason is a general lack of sophistication. Most search engine users fail to ever click past the initial page of results. It is likely that they never select a result not listed in the top three slots. This shows why search engines play such an important role in determining whether the Internet is truly equal.

Hindman’s study suggests clear impacts on American politics. Online search browsers provide users with a point of entry to the Internet, but if users continually select only the first or second options, they are missing other potential sources—sources that could in fact be better suited to their needs. The high degree of overlap between the results obtained with the Yahoo! and Google seed sets, particularly among heavily

linked sites, underlines this point. Any site that is more than three clicks away from any of the top 200 Google or Yahoo! results on a given topic is off the beaten track and highly unlikely to have any substantial impact on mass politics. Google's "I'm Feeling Lucky" button only makes this more so. Now, consumers do not need to consider which site to go to. Google will allow its private algorithm to decide for the consumer and then automatically open that page.

Social Media

Social media has inserted a new variable into Hindman's idea of Googlearchy. Now, with any individual having the ability to publicize his or her views or beliefs, some argue that the Internet has reached a state of complete openness. Yet, the approach of social media suggests that this is not the case. While one can post a political message on Facebook, it will only be visible to friends. A Google search will not return the message. The same is true for Twitter or any other social media site. One may have an audience, but it is entirely composed of individuals who have self-selected to read one's work. It is not available for anyone to stumble upon. In this sense, social media is in many ways even less democratic than the traditional Internet.

Hindman's theory has not been met with universal acceptance. Micah Sifry has made the most comprehensive set of arguments against Hindman—most notably during the 2009 Digital Democracy Debate at Yale. Sifry argues that while access may not be entirely equal, it is no longer fully dependent on having money or connections. Anyone can have a blog, Web site, or Twitter account, and grow an audience. Blogs in particular, Sifry claims, are equalizing because bloggers have a continual conversation with readers. Bloggers may be more educated, but that does not mean that their readers are. While Hindman tries to claim that the Web, as a whole, emphasizes sound bites far too much, he neglects the many ways that content is directly rewarded. No one—Sifry claims—seems to notice that the second most popular Obama video on YouTube is 37 minutes in length.

Clay Shirky (backed by Evgeny Morozov) adds another point of contention with Hindman by stating that when political data becomes available online, it actually shifts the information balance toward ordinary citizens. Instead of having

to travel to government, government is accessible through a home computer. Hindman fails to speak to this point. Matt Bai argues that Hindman's data is old, and "the political impact of the Internet is spreading so quickly that it's almost impossible to capture and quantify." He disparages Hindman's graphs and equations and prefers anecdotes about Internet activists from modest backgrounds. And Manuel Castells points to the power of the Internet generally in helping citizens at the point where people look to "take matters into their own hands, engaging in collective action outside the prescribed institutional channels, to defend their demands and, eventually, to change the rulers and even the rules shaping their lives."

Google+

Google+ is a social network launched by Google in summer 2011. During its initial soft launch it used a user-to-user or an invitation-only basis. Then in fall 2012, Google opened Google+ to everyone, and the Web site quickly became one of the most popular social networking Web sites after Facebook and Twitter. Google+ can be accessed on a computer or on iOS or Android mobile device through apps. The site has attracted more than 400 million accounts, with more than

359 million active users in May 2013. Individuals over age 18 with Google accounts can become users of Google+. These users can follow people and organizations of interest and group these individuals and organizations into circles. Google users have the ability to organize other users in one or more circles. These circles can be public or private, and certain circles can receive specific content. Google+ has a variety of features, including Google+ Hangouts and Google+ Events.

Google+ Hangouts allows users to communicate synchronously using audio and video. Users can share and view Google Docs or watch YouTube videos within the hangout. A maximum of 10 users can participate in a Google+ Hangout. Hangouts can be recorded (Hangouts on Air). Hangouts on Air are streamed to YouTube. Others can watch the YouTube stream synchronously or asynchronously. The link to the YouTube video can be embedded in a post on Google+, so users can watch the stream synchronously or asynchronously in Google+.

Google+ Events can be used to schedule events inside or outside of Google+. Google+ Events are synced with users' Google Calendars. Users can create an event to schedule a hangout or an event when the users will be at the same location. Users can also share photos associated with an event.

Communication on Google+

Google+ users can communicate their interest in content across the Internet by the +1 button or Share button. When a user utilizes the +1 button, this click represents an endorsement for news or controversial articles. The share button is generally utilized for news articles, videos, and so on.

Google+ is integrated with other Google products. For example, YouTube videos can be embedded into posts or viewed by all members of a Google+ Hangout. Users can share and view Google Docs within a hangout. Users can employ Google Messenger to chat with other users. Google+ users can use hangouts within Gmail to chat with other users. Google+ users can post pictures in Picasa Web albums in Google+. Google+ can be integrated with Blogger.

Users can also create pages for organizations. For example, businesses can use pages to interact with customers. Small businesses can take advantage of the Local features to interact with

customers in their area. Local takes advantage of the Zagat rating system. Colleges and universities can use pages to interact with current students and recruit prospective students. Professors can create pages for their classes and host office hours or record lectures with Google+ Hangouts.

Google+ and Politics

Google+ was utilized in the 2012 presidential campaign by President Obama. He used Google+ Hangouts to communicate with the public through the White House Google+ Hangout event. This event was automatically streamed to YouTube, and viewers could interact directly with the president. The White House Google+ Hangout was the first virtual presidential interview held in the White House. This event provided viewers with opportunities to ask very candid questions focused on the National Defense Authorization Act (NDAA), Stop Online Piracy Act (SOPA), and Anti-Counterfeiting Trade Agreement (ACTA). Through this social media Web site, Obama received questions from viewers across the nation, and one viewer provided Obama with an opportunity to find her husband a job because he was out of work.

During the 2002 presidential election, a Google Politics and Elections 2012 page was launched on Google+. Using the hashtag #googlepolitics, the Google+ page focused on politics featured infographics such as the top five rising search terms in the United States. This infographic featured the following most popular search terms: Popular Vote 2012, FL Election Results, Stock Market, Diane Sawyer Drunk, and Puerto Rico Statehood. Viewers were encouraged to provide comments on each infographic through a text window on the right-hand side of the screen. During the final presidential debate, Google+ published an infographic titled The Top 4 Search Terms During the Final Presidential Debate. This infographic was divided by the following terms: With Obama and With Romney. The four top search terms under With Obama were: Apology Tour, Bin Laden, 2008, and Horses/Bayonets. The four top search terms under With Romney were Auto Bailout, What Is on Flag Pin, Budget Plan, and What Kind of Car Does Mitt Drive. Seventy-six Google+ users gave the infographic a +1 (endorsement), 19 Google+ users forwarded the article, and 34 people provided comments below the infographic.

Google+ provided infographics related to search terms during and after each presidential debate.

During the weeks leading up to the election, Google+ created a Voter Information Tool and Civic Information API. These tools were utilized to find voter ID requirements, early voting sites, sample ballots, and polling places. More than 600 Web sites embedded the tool into their sites, including the *Huffington Post*, CNN, the Democratic Congressional Campaign Committee, and the Republican Congressional Campaign Committee. Following the presidential election, Google+ made plans to provide the same service for other countries, including Italy, Kenya, the Czech Republic, and Ghana.

Grassley, Chuck

Charles (Chuck) Grassley is a Republican senator from Iowa. Grassley has served in the U.S. Senate since first he was elected in 1980. He is known for his low-key style, work ethic, and ability to work across partisan lines. In the Senate, Grassley has advocated cracking down on government waste, more government accountability,

and whistleblower protection. He sits on a number of committees including those for judiciary and finance. His hometown newspaper, the *Des Moines Register*, recently ranked him the member of the Iowa delegation with the most political pull.

Charles Grassley was born September 17, 1933, in Iowa. He attended the University of Northern Iowa, where he received a bachelor's degree in political science in 1955. Grassley continued at the University of Northern Iowa, where he graduated with a master's degree in political science. He began, but did not finish, a Ph.D. in political science at the University of Iowa. In 1958, he was elected to the Iowa State Legislature, where he served until 1975. In 1974, Grassley won election to the House of Representatives, serving there until 1981. While serving in the Iowa State Legislature, he also farmed and worked in a factory.

U.S. Senate

In 1980, Grassley challenged and subsequently beat incumbent John Culver (D) from Iowa for a seat in the U.S. Senate. In election after election, Grassley won re-election by comfortable margins. Since 1980, he has received at least 60 percent of the vote in his re-election bids. Most recently, Grassley was reelected in 2010, easily defeating his opponent, Roxanne Conlon. Many attribute Grassley's political success to his work ethic. Over the years, he has repeatedly visited Iowa's 99 counties. Almost every weekend, Grassley returns to Iowa and holds meetings with his constituents. Grassley's constituents also appreciate the fact that he has not missed a vote since 1993 (the only vote he missed was because of inspecting the damage from a flood in Iowa that year).

Grassley also portrays himself as an unassuming, down-to-earth Iowan. He likes to portray himself as just another Iowan who still works on his farm with his family when he travels home every weekend.

In the 1980s, Grassley demonstrated his independence from the policies of Ronald Reagan. Throughout the decade, he voted against the Reagan administration's farm policies, which were unpopular in Iowa. Throughout his Senate tenure, agriculture has been one of Grassley's priority issues. He has championed aid to farmers throughout his Senate career. In 1996, he supported the Freedom to Farm Act, which

reformed agriculture policy. In the Senate, Grassley has unsuccessfully sought to limit farm subsidies to smaller farmers. For example, in 2002, he failed to put into a farm bill a measure limiting farm subsidies to farmers making no more than \$275,000. Grassley has also supported ethanol subsidies for farmers.

An issue where Grassley departs from many of his Republican colleagues in the Senate is defense. He is a frequent critic of defense spending and often highlights cases of Pentagon waste. Grassley stood out from the rest of his Republican colleagues by voting against the Gulf War in 1991. He has established a reputation for being a dove on defense issues. On the other hand, Grassley voted to authorize the use of force in Iraq in 2002.

Throughout his career, Grassley has been passionate about exposing waste and fraud in government agencies. Grassley has exposed fraud and waste in the Defense Department, the Securities and Exchange Commission, and many other government agencies. He has supported legislation protecting whistleblowers who reveal waste and fraud in government agencies. Grassley succeeded in passing legislation that required that Congress follow the same laws that it passed. More recently, Grassley has criticized the Bureau of Alcohol, Tobacco, and Firearms for Operation Fast and Furious—an undercover operation that provided guns to Mexican drug dealers and led to the death of a border patrol agent.

Committees

Grassley has served on a number of committees in the Senate including agriculture, judiciary, and finance. From 2003 to 2007, he was chair of the finance and judiciary committees. Today, he is the senior-ranking member on these committees.

Over the years, Grassley acquired the reputation as a politician willing to work across party lines to achieve his goals. While considered a conservative, he is not perceived as a confrontational figure in the Senate. For example, he was known for his close working relationship with Senator Max Baucus of Montana. Baucus is currently the chair of the Finance Committee, and from 2003 to 2007 he was the ranking committee member when Grassley was the chair. Grassley and Baucus worked together on a number of issues, including tax cuts, tax reform, and health care. In 2009, it

Senator Chuck Grassley talks with Federal Emergency Management Agency Congressional Representative Jodi Bruckner before attending a town hall meeting in Waverly, Iowa, to hear from local residents affected by a severe flood in 2008.

appeared that the duo would forge a compromise on health care, but the negotiations ultimately collapsed.

Obama Administration

In recent years, Grassley has been criticized for taking a more partisan tone. He voted against President Obama's stimulus plan in 2009, and the Affordable Care Act in 2010. Grassley was condemned for alleging that there were death panels in President Obama's health care bill and for walking away from health care negotiations. On the other hand, Grassley contends that President Obama and the Democrats walked away from health care negotiations. In addition, Grassley has voted against many of President Obama's judicial nominees and has blasted the attacks on the U.S. consulate in Benghazi and the botched Operation Fast and Furious.

Critics also note Grassley's use of cutting-edge media to attack the Obama administration. Over the last few years, he has utilized Twitter to send

short, pithy tweets criticizing President Obama and his policies.

Critics see political opportunism in Grassley's attack on President Obama pointing to the rise of a strong Tea Party movement in Iowa. Grassley's supporters reject this charge, arguing that Grassley is merely upholding longstanding values in opposing President Obama's policies. They argue that President Obama's taxing and spending policies clash with the fiscal conservatism of Grassley.

In his career in the Senate, Grassley has a conservative voting record of 86 percent. He frequently votes with Republicans on issues such as the budget, tax cuts, and abortion. On the other hand, he has broken from his party in his opposition to the Gulf War and his support for alternative energy. While accumulating a conservative record, Grassley has won over independents and Democrats in the state of Iowa. This has primarily been because of his pleasant demeanor, work ethic, and perception that he is a bipartisan political figure (though that image has been challenged by critics since 2009). Grassley is one of the longest-serving senators in Iowa history, and with reelection in 2016, he may have the distinction of being Iowa's longest-serving senator.

Great Firewall of China

The "Great Firewall of China" (GFW or GFC) is a phrase coined by Charles R. Smith in 2002 to describe Internet censorship in China, where foreign "harmful" ideas are prevented from invading the authoritarian state to safeguard its one-party rule through filtering content as well as monitoring users online. The metaphoric term draws parallels between the world's most complex Internet control system and the Great Wall, a magnificent ancient fortification built to protect China proper from intrusions by nomadic groups. A firewall is a network security system that controls the flow of information that travels through a node. A common interpretation of the GFW refers narrowly to the inspecting, filtering, and blocking technologies deployed in the international gateways of Chinese Internet service providers (ISPs). Nevertheless, some use the term loosely to imply

the whole set of legal, regulatory, and technical measures China has put in place for Internet censorship and control.

CNCERT/CC

The GFW is operated by the National Computer Network Emergency Response Technical Team Coordination Center of China (CNCERT/CC) under the Ministry of Industry and Information Technology (MIIT). The chief designer of the project, Binxing Fang, dubbed as the father of the GFW by Chinese Internet users, is the president of Beijing University and a professor of posts and telecommunications. The GFW is often confused with the Golden Shield Project (GSP), a public security information technology project aiming to establish a nationwide computer application and communication system for the police force. Both projects started in late 1990s, but the GFW is a tool of ideology control, whereas the GSP is primarily used for crime prevention and investigation by the Ministry of Public Security (MPS). Because Internet crime investigation and monitoring constitute a part of the GSP, it is possible that the GFW and the GSP overlap to a certain degree, but the relationship remains ambiguous.

While CNCERT/CC oversees the daily operation of the GFW, CNCERT/CC is merely a technical and research organization that has little influence over censorship decisions. Orders of censorship (for example, which Web site to block, which keyword to filter) primarily come from government institutions that wield stronger political power, such as: the Central Propaganda Department, the State Council Information Office (SCIO), and the Public Information Network Security Supervision Department of MPS.

The hardware of the GFW is mainly produced by domestic information technology companies such as Sugon (Shuguang) and Huawei to ensure information security and to protect state secrets. However, quite a few American companies, including Sun Microsystems, Cisco, Nortel Networks, 3COM, Websense, and Bay networks of California have all been implicated in sales of Web filtering and monitoring technologies to China. The OpenNet Initiative's 2004–05 report on Chinese Internet filtering claims that the backbone of China's Internet relies on Cisco technology.

The general philosophy of Internet control in China is to territorialize domestic computer networks into a large national intranet with connections to the rest of the world funneled through a few major Internet service providers. The international gateways are located in three metropolitan areas: Beijing, Shanghai, and Guangzhou. The largest two Chinese ISPs are CHINANET and CNCGROUP, owned by China Telecom and China Unicom, respectively. According to findings from a series of empirical testing conducted by researchers from University of Michigan in 2011, CHINANET possesses 79.4 percent of the filtering interfaces, and CNCGROUP possesses 17.4 percent.

CHINANET has a mature filtering capability, whereas CNCGROUP has continuously strengthening its infrastructure. Most of the filtering devices are concentrated at border routers, but a small proportion are internal autonomous systems. This leads observers to suspect that the GFW also has the capability to monitor and filter domestic traffic. CNCGROUP places most of its filtering devices in the backbone, but the majority of CHINANET's filtering devices belong to provincial networks.

Targeted Content

Legislation has been introduced since the mid-1990s to restrict the flow of Web content that could endanger the rule of the Chinese Communist Party. The claimed purposes of Internet censorship in China are always vague and broad. Laws and regulations prohibit the production and dissemination of information containing content that endangers national security, divulges state secrets, subverts the government, undermines national unification, harms the honor and interests of the state, defames government agencies, instigates ethnic hatred, preaches cults or feudal superstitions, disturbs social order, encourages gambling, and shows pornography and violence.

In practice, the blocked Web sites roughly fall into eight categories: foreign social media platforms; foreign news sites; file sharing sites; overseas Chinese portal sites and discussion forums; dissident, prodemocracy, and human rights sites; circumvention and anonymizer tools sites; sites maintained by Falun Gong; and pornography and gambling sites.

The most heavily censored keywords are the names of top leaders and dissidents, Falun Gong, and the 1989 Tiananmen Square crackdown. The blocked sites and filtered keywords are not fixed, and tend to vary across time. For example, during the 2008 Beijing Olympics, the government loosened Internet control by unblocking a number of sites, including China Times, Mingpao, Wikipedia, and BBC. In contrast, during politically sensitive periods such as the “two meetings” (the annual meetings of the National People’s Congress and Chinese People’s Political Consultative Conference), the government tends to tighten up the control.

Technical Measures

To control the domestic network, the government has a large variety of legal and administrative measures at its disposal, including promoting self-regulation, deploying human censors and Internet police force, recruiting paid commentators, or even shutting down regional Internet connections when needed. Nonetheless, when it comes to dealing with content from international Web sites, blocking and filtering are the only feasible choices. The Chinese authorities have never publicized any technical details of the GFW, but researchers worldwide have conducted various empirical and technical studies of the GFW. The most frequently mentioned techniques are Internet protocol (IP) blocking, DNS manipulation, URL filtering, and keyword filtering.

IP blocking is the earliest form of filtering mechanism used in China. All international gateways of the Chinese network are configured with a list of banned IP addresses—numerical labels assigned to computers connected to the Internet to indicate where the computers are located. When users try to access a blacklisted address, the packets will be routed to a black hole server, which then ignores the connection request. IP blocking is easy to implement, adding only a tiny workload to the gateway routers; however, it tends to “over-block” innocent Web sites. When a target is hosted on a server with multiple sites, all Web sites will be blocked because they share the same IP address. However, if a banned Web site moves or copies its content to another server with a different IP address and keeps the domain name unchanged, the blocking can be circumvented

(assuming the site is not banned through DNS manipulation) until the Chinese authorities spot the new IP address and update their list.

Most people visit a Web site through typing its domain name into an Internet browser, and few would remember its IP address. The domain name system (DNS) is a database used to translate textual hostnames (for example, `www.facebook.com`) into IP addresses (for example, `173.252.110.27`). In addition to the IP address list, the GFW maintains a list of banned domain names. When a router detects any predefined domain name queries passing through network traffic, the GFW will inject a forged IP address so that users will not be able reach the desired Web site or will be redirected to a wrong site. Almost all the DNS servers in China are polluted.

Some computer users in China have found ways around the Great Firewall. These bloggers were visiting social media sites at the November 2008 Chinese Blogger conference in Guangzhou.

When Google's search engine service was blocked in 2002, domestic requests to access Google.com were directed to Baidu.com. A uniform resource locator (URL) is a string of characters representing a Web address, which usually consists of a protocol name, a domain name or IP address, and a path (for example, https://en.wikipedia.org/wiki/Falun_Gong). A requested URL string can be scanned for blacklisted keywords.

Keyword filtering (packet filtering), which occurs at the protocol level, rather than at the network level, is more technically complex. When a connection between two computers is established through a three-way handshaking process, information wrapped in TCP segments will flow through a series of routers to reach its destination. Routers use intrusion detection system (IDS) technology to inspect content contained in TCP packets for predefined keywords. When blacklisted keywords are spotted, multiple forged TCP reset packets (RST flag) will be sent to both ends to terminate the connection. Once activated, the blocking can last for a few minutes to an hour.

Relying upon a set of keywords, packet filtering is more flexible than other measures because it can dynamically cut out a connection without locating the originations of the information (e.g., domain name, IP address, or URL) or blocking the whole Web site, regardless of the content on individual pages. For example, both English and Chinese Wikipedia homepages are accessible in China. However, when one tries to access the page of Wikipedia entry for Falun Gong, it takes a long time to load a part of the page. When the "refresh" or "reload" button is clicked, the connection is terminated.

Circumvention and Countermeasures

Despite its technical sophistication, the Great Firewall is not invincible. The two basic requirements to bypass the GFW are reliable proxy servers and encryption. A proxy can serve as an intermediary to relay information from the otherwise blocked sites and filtered pages to end users, while encryption keeps keyword filtering from identifying "harmful" content in traffic streams. The common tools of circumvention include anticensorship software, virtual private networks (VPN), and secure shells (SSH). Most anticensorship software

(e.g., FreeGate, GoAgent, GTunnel, Ultrasurf, Psiphon, and Tor) relies on open, free proxies, but VPN and SSH use private hosts outside of China. Only a small fraction of tech-savvy Chinese users know how to climb to the other side of the GFW. According to a nonrepresentative online survey conducted in 2010, Internet users who use circumvention tools were predominantly young males with high levels of education, and FreeGate, Ultrasurf, and Psiphon were most popular in China because of their nontechnical features.

Circumvention tools are not invulnerable. The GFW can detect and block proxy servers used for circumvention via analyzing Internet traffic; and recently, more sophisticated technologies have enabled the GFW to recognize encrypted protocols. Thus, all circumvention tools have to seek technology innovation to stay up-to-date. The tug of war between Tor and the GFW serves as a good example. Tor started as an anonymous communication tool in 2002, and was used for circumvention by many Chinese Internet users. Tor used a centralized directory server, which maintains a list of proxy nodes. However, when the IP address of the directory server was blocked by the GFW, Tor became useless, and lost its Chinese users. Tor came back to life through developing hidden "bridge" nodes that are not listed in the directory server, but the GFW learned the way to block hidden private bridge nodes in 2011.

In 2012, Tor launched a new product named obfsproxy, which can transform Tor traffic into innocent-looking traffic so that the GFW cannot differentiate the use of Tor from other Internet activities. It is possible that the GFW will soon find a way to defeat obfsproxy. The arms race between blocking and circumvention will not end until China aborts the mission of Internet censorship.

Gun Control

Gun control is an issue that regularly rises to the top of the public agenda in the United States. Since the mass shooting in Columbine, Colorado, in 1999, similar incidents have reignited the discussion of gun control. Social media provide an outlet for immediate reaction to these events, as well as a venue for actors on both sides of the debate to maintain a level of constant surveillance and awareness. Gun control advocates monitor incidents involving mass or accidental shootings, whereas gun control opponents monitor and share stories about laws and proposals to restrict gun ownership. Existing Internet memes, as well as events, both expected and unexpected, provide points of synthesis for advocates on both sides, tying the issue of gun control to issues of race and immigration. Misinformation and exploitation are also part of the public discourse. The networks of actors in the debate are distinctly different in structure and in the rhetorical substance of their arguments.

The social media presence of pro-gun forces is both centralized and prominent across social media platforms. By contrast, citizens and organizations who support stronger gun control regulations are disbursed across numerous organizations, both gun focused and not. While many are joining in on the conversation, few maintain a singular focus in the manner of pro-gun forces.

The National Rifle Association (NRA) provides a centralized hub that connects gun

manufacturers, gun enthusiasts, and politicians who support the NRA agenda. With a Facebook page boasting more than two million followers, they are the dominant voice in the debate. Another, albeit smaller organization, Gun Owners of America (GOA), was founded in 1975 by a former NRA board member, and positions itself to the right of the NRA. GOA proudly features an endorsement by Ron Paul on several of their social media profiles that reads: "The only no-compromise gun lobby in Washington." This group has fewer members, but is quite active in lobbying Congress, and has a frequent presence on political television talk shows when the topic is gun control, clips they proudly feature on their YouTube channel. Within the network are large industries that manufacture firearms and accessories.

Proponents of gun control are present in a more disbursed network, which includes large organizations such as the Brady Campaign to End Gun Violence and other organizations formed by families and allies of victims. The Newtown Action Alliance emerged after the 2012 school shootings in Sandy Hook, Connecticut. Another group that quickly gained a relatively high level of support is Americans for Responsible Solutions, the organization formed by Congresswoman Gabrielle Giffords, who was seriously injured in a mass shooting in Tucson, Arizona, in January 2011. Other groups in the network include Moms Demand Action, which is organized at the state level, as well as groups with religious affiliations that campaign against violence.

Another longstanding and very active organization is Mayors Against Illegal Guns, founded by Mayor Michael Bloomberg of New York with hundreds of other U.S. mayors. During the 2012 legislative battle over background checks on gun purchases, Mayors Against Illegal Guns set up a Web site at DemandAction.org to encourage citizens to put pressure on congressional representatives, calling on them to support the Manchin-Toomey bill. Despite their efforts, the bill was ultimately defeated in the U.S. Senate on April 17, 2013, prompting the establishment of ShameOn-Congress.org.

Facebook

Beyond its homepage on Facebook, the NRA maintains other Facebook pages targeted to

specific demographics such as veterans, women, youth, and sportsmen. These related pages often have subscribers numbering in the tens of thousands. The official NRA page “likes” all these pages, as well as a number of politicians and firearms manufacturers, establishing a large network of individual enthusiasts, corporations, and politicians. The homepage also promotes meetings of the Friends of NRA through the Facebook “Events” feature, and facilitates online donations through a quick link to their membership enrollment page. “Profile Badges” allow other Facebook users to affiliate themselves with the NRA brand through a downloadable profile image. Gun Owners of America maintains a Facebook page with almost 240,000 subscribers. A lobbying organization, in May 2013, it partnered with Congressman Steve Stockman, the recipient of campaign donations from GOA, in promoting the giveaway of an AR-15 rifle, which it billed as “the Gun (sic) Obama doesn’t want you to have!” Other pages such as “Women Against Gun Control” share blueprints for weapons and an image of an attractive woman with a gun accompanied by the text, “Random Fact: Shooting a gun causes the same chemical reaction in the brain as a passionate kiss.”

In contrast to the two major pro-gun organizations, none of the organizations working to restrict access to firearms have a comparable number of subscribers on Facebook. The Brady Campaign to End Gun Violence has a little over 50,000 subscribers, and Americans for Responsible Solutions has more than 80,000. The congresswoman’s personal page, however, has almost 180,000 subscribers, an indication of the diffuse nature of the network of gun control supporters.

Twitter

The advantage that pro-gun organizations enjoy on Facebook is not as prominent on Twitter. The @NRA Twitter account has slightly more than 160,000 followers, whereas Congresswoman Gifford’s account has nearly 130,000 followers. The account for the Brady Campaign has far fewer followers, but a search reveals that many other Twitter users tweet news about their legislative and legal activities in the form of press releases and other publications.

The #NRA hashtag has been appropriated by the organization’s opponents, although sometimes #guncontrol is also used. Other hashtags trend when incidents make news headlines (e.g., #SandyHook, #Aurora, and #NOLA). #DemandAction was used by Mayor Michael Bloomberg’s group to bring pressure on behalf of gun control legislation in Congress. Gun enthusiasts use the “right to keep and bear arms” (#RKBA) hashtag, as well as other conservative hashtags (e.g., #2a #tcot, and #tgdn). They also use #molonlabe, a term popular with gun enthusiasts that translates to “come and get it.” Most notably, gun enthusiasts who are motivated by a mistrust of government have adopted this term, which can be found on numerous social media Web sites and blogs. Within this community of interest, the keywords and hashtags are used to sell merchandise as well as to share links and information of interest. The same connection can be seen with “shit hits the fan” (#shtf), a hashtag used by gun manufacturers and other marketers to reach out to “preppers” who purchase and stockpile goods in preparation for an anticipated societal collapse.

A phenomenon that appears in both pro-gun and anti-gun networks on Twitter is the maintenance of a low level of surveillance at all times, interrupted by spikes in activity and trends in response to larger-scale events. For those who support gun control, daily monitoring of deaths from gun violence or accidental shootings, along with tallies of the number of gun deaths since the last mass shooting, are common. The progress of legislation restricting gun ownership is also monitored. As for gun enthusiasts, they monitor stories they regard as evidence of infringement on their Second Amendment rights, such as any legislation limiting ownership or requiring background checks for gun purchases.

Tumblr

Tumblr is primarily a visual microblogging site that is popular among the younger demographic of digital natives. Animated GIFs are a common form of content, and many users curate threads that use the “scrolling” affordance of Web pages as the primary storytelling technique. While content by both pro-gun and anti-gun activists is present on Tumblr, it is less well organized, and

search results turn up messages from both sides, as well as numerous visuals without comment, including still-life arrangements of guns and ammunition and images of attractive women posing with various types of weapons. There are also messages in support of gun control in the form of text, editorial cartoons, and links to external content. True to its name, Tumblr presents a mash up of the sexualization, deliberation, moralization, and celebration of U.S. gun culture and weapons, with some messages that present clear opinions on the issue, whereas others are marked by ambiguity.

Pinterest

Although it is a relatively new site in the social media genre, Pinterest has quickly attracted a large following. Like Tumblr, the site is image focused, with users “pinning” images to “boards” based on various themes. It is a popular site for home improvement do-it-yourselfers, recipe exchangers, and those interested in fashion. Many retailers are successfully using Pinterest as a marketing tool, with links directly to pages that allow users to purchase the “pinned” item. The NRA has created a network of organizations that pin their interest groups and consumer groups together. Large online gun retailers are found on Pinterest via links from the NRA homepage, and these companies prominently feature products and organizations that represent outreach to women interested in sports, self-defense, and gun fashion. Gun Owners of America is not officially present on Pinterest, but a search for its name reveals other users pinning their logo and memes to boards with names such as “We the People,” and “Self Defense.”

Advocates of restrictions on gun control are difficult to find on Pinterest. The Brady Campaign has a board that has seen very little activity. Congresswoman Gifford’s organization is not present, except through pins posted by other users. Mayors Against Illegal Guns is also present, only as content pinned by individual users to boards with names such as “issues, causes, etc.” and “gun control issues.” Gun control content primarily takes the form of infographics and other visual/text combinations.

Arguments about gun control and restrictions on ownership of guns predate the rise of social

media and the Internet. The argument has continued on social media, which allow for a constant level of awareness and surveillance. Gun manufacturers, related industries, and organizations such as the NRA have a well-established, highly centralized, extensive network of social media accounts.

These accounts have only two purposes: to oppose restrictions on gun ownership, and to market guns and gun-related products to sportsmen, enthusiasts, and survivalists. On the pro-gun side of the argument, the messages often associate guns with sexual attractiveness, masculinity, personal independence, “American family values,” achievement, and patriotism.

Among supporters of gun control, there are no groups currently arguing for legislation beyond limitations on the capacity of certain weapons or restrictions on access to certain groups via background checks. The network of pro-gun control advocates is highly diffuse, disbursed among a large number of organizations, none of them with the reach of the NRA. They are primarily organizations founded by the families of victims, or in the case of Gabrielle Giffords, the victims themselves. These groups may be at a disadvantage in a medium that prefers positive messages, as indicated in a study conducted by the Pew Research Center on the tone of social media.

There was an outcry among the public for more restrictions on gun ownership after the Newtown, Connecticut, elementary school shootings. In December 2012, an online petition to the White House calling for restrictions on gun ownership set a record for support, and public opinion polls consistently recorded 90 percent support for increasing requirements for background checks.

After the failure of the Manchin-Toomey legislation, one Bloomberg News writer wrote a story with the headline: “The Internet Declares War on the NRA.” Despite the hurricane of traditional coverage and social media conversation on both sides of the issue, in April 2013, the U.S. Senate rejected a compromise gun control bill that would have prohibited private ownership of some types of military-style assault weapons and expanded the federal requirement for background checks on firearms sales. In the absence of meaningful national legislation, the

gun control debate continues to be thrashed out on state and local levels.

Gutiérrez, Luis

Luis Vicente Gutiérrez is the U.S. representative for the 4th Congressional District of Illinois; he has served in that office since 1993, when he became the first Latino to represent a midwest constituency in Congress. Gutiérrez represented the 26th Ward of Chicago on the city council from 1986 until he was elected to Congress. He belongs to the Democratic Party and the Congressional Progressive Caucus. An outspoken champion of immigration reform, Gutiérrez entered the 113th Congress in 2012 as the Illinois House delegation dean. Gutierrez is a supporter of many liberal political causes. Of Puerto Rican ethnicity, he supports independence for Puerto Rico. A major advocate on behalf of rights for workers, women, and gay, lesbian, bisexual, and transgendered (GLBT) rights, Gutiérrez's biting oration and strong support for the disenfranchised have earned him the nickname *El Gallito*, the little fighting rooster.

City Political Career

Gutiérrez, a teacher and social worker by training, left his position with the Department of Children and Family Services of Illinois in 1983 to run for office. In order to fund his campaign, he drove a taxi for seven 14-hour days a week; this gave him \$6,000 for his challenge of Dan Rostenkowski for the 32nd Ward Democratic committee position. With a campaign staff of friends and family supporting him, Gutiérrez personally collected more than 75 percent of the 2,200 signatures that his qualification demanded. Rostenkowski defeated Gutiérrez by a strong margin.

In 1984, Gutiérrez went on to help establish the Cook County Coalition for New Politics, a grassroots means for a progressive, multiracial challenge to the traditional Democratic Party in Chicago. Gutiérrez's activist work made him a new and impressive leader for Latinos in Chicago, and this was noted by Chicago Mayor Harold Washington. Washington was the first African American mayor of the city, and he appointed Gutiérrez deputy superintendent for the Department of Streets and Sanitation in 1984. Gutiérrez accepted that role and served on the Mayoral Committee on Infrastructure when he became an administrative assistant to Mayor Washington.

In autumn 1984, the Gutiérrez home was firebombed with a Molotov cocktail. The family stayed in hotels for several months, but the attackers were never caught. In an effort to generate political reform in concert with the efforts of Mayor Washington, Gutiérrez created the 26th Ward Independent Political Organization (IPO) in 1985. Another grassroots effort including citizens of many races, the organization raised \$5,000 and signed on 100 new members at its first event.

In 1985, the wards of Chicago were remapped, creating a new Latino majority district, the 26th Ward. This ward and six others were the subjects of a special election ordered by a district court judge. The existing alderman in Ward 26 chose not to run for the spot, and Gutiérrez announced his candidacy with the endorsement of Mayor Washington. This one space on the city council would change the balance of power in favor of the mayor if Gutiérrez was successful, and opposition to Washington in Chicago was still vehement. As a result, the race was heated.

The vote between Gutiérrez and his opponent, Torres, went to a runoff based on the closeness of the initial vote. Their final debate aired on Spanish-language television, and Gutiérrez chose to debate partly in Spanish in contrast to Torres, who used only English. Gutiérrez's grassroots approach and his use of Spanish are generally thought to have won the vote for him.

Gutiérrez quickly became a leader on the floor and among Latinos on the council. He was a primary supporter of the gay rights ordinance of 1986 banning sexual orientation-based discrimination. Gutiérrez also promoted affordable housing and local development. In 1987, Gutiérrez was reelected to his seat over five opponents. Upon Mayor Daley's 1989 election, Gutiérrez became city council president *pro tempore* and chair of the Housing, Land Acquisition, Disposition and Leases Committee.

Congressional Career

In 1990, a new Latino majority congressional district was formed by court order. Gutiérrez ran for Congress in this district in 1992 with the endorsement of Mayor Daley and defeated his Mexican American opponent in the Democratic primary, Juan Soliz, despite the majority Mexican American population of the district. Gutiérrez went on to defeat Republican candidate Hildegard Rodríguez-Schieman in the general election of 1992, and began his tenure in Congress in 1993.

Gutiérrez was reelected in 1994 with 75 percent of the vote. This was the lowest general election winning percentage Gutiérrez ever showed. From 1996 through 2008, Gutiérrez was continually reelected, never with less than 80 percent of the vote. In 2010, he was reelected again, this time with 77 percent of the vote, technically a low percentage for him, albeit a remarkably large number generally speaking.

Issues and Advocacy

Gutiérrez has been a consistent and outspoken advocate for immigrants' rights and immigration reform. Nancy Pelosi appointed him chair of the Democratic Caucus Immigration Task Force in 2009, and was also the chair of the Congressional Hispanic Caucus Immigration Task Force in 2012. He also served on the Judiciary Committee

on the Immigration, Citizenship, Refugees, Border Security, and International Law Subcommittee. Gutiérrez has also worked to assist immigrants in his district to access English-language programs and to become U.S. citizens.

Gutiérrez was the first in Congress to sponsor the Development, Relief and Education for Alien Minors (DREAM) Act in its first incarnation in 2001. The DREAM Act was designed to allow undocumented minors brought illegally to the United States a means to gain citizenship. Gutiérrez introduced the Comprehensive Immigration Reform for America's Security and Prosperity Act (CIR-ASAP) in 2009 as a means for undocumented immigrants without criminal records to gain U.S. citizenship. CIR-ASAP was defeated, and Gutiérrez backed the latest incarnation of the DREAM Act in 2012, which was ultimately passed.

In addition to his legislative activity for immigrants, Gutiérrez also partook in two separate nonviolent demonstrations outside the White House. The first took place in 2010 in response to Arizona's SB 1070, allowing police to engage in racial profiling to enforce immigration laws at the state level. Gutiérrez made a speech and marched with other activists that day, refusing to leave until President Obama acted or he was arrested; like other activists, he was arrested that day.

In 2011, the number of deportations during the Obama administration's tenure reached 1 million, a record. In response to this and Obama's refusal to extend the DREAM Act to covered youth, Gutiérrez was arrested outside the White House along with 11 other leaders, with more than 2,500 supporters looking on in solidarity.

During Gutiérrez's time on the Veterans' Affairs Committee, he introduced legislation providing sexual trauma victims with counseling and treatment. He also fought to extend health insurance coverage to veterans exposed to radiation and Agent Orange during service. Gutiérrez also helped disabled veterans access more funds for health care and prosthetics.

Gutiérrez also advocated for consumer rights by backing the creation of the U.S. Consumer Protection Bureau and striving to stop predatory lending by capping annual percentage rates (APRs) on payday loans. As chair of the Financial Services Subcommittee on Financial Institutions

and Consumer Credit, Gutiérrez helps to oversee all financial regulators, including the Federal Deposit Insurance Corporation (FDIC), the Federal Reserve (the Fed), the Office of the Comptroller of the Currency, the Office of Thrift Supervision, and the National Credit Union Administration (NCUA).

Gutiérrez has a record of advocacy on behalf of Puerto Ricans. He was very active in the fight to stop the U.S. military from using Vieques, a populated island, as a testing ground for bombing, and in 2000 was arrested for refusing to leave the bombing range. In 2011, Gutiérrez was a vocal advocate on behalf of students victimized by police brutality as they protested government restriction of freedom of speech. He also opposed a planned pipeline as an environmental danger and physical hazard to residents of the island.

An advocate for workers' rights, Gutiérrez has assisted labor unions with sit-ins and negotiations. He voted against the North American Free Trade Agreement (NAFTA) because of its failure to protect jobs and rights on both sides of the border.

Use of Social Media

Luis Gutiérrez is widely recognized as one of the most effective users of social media in Congress. First introduced to social media by his daughters, the younger of whom was in college at the time, the Congressman quickly appreciated the ways that social media were bringing people together politically and socially.

Soon after discovering Facebook and Twitter, Gutiérrez started a social media profile, and his online presence began to grow. Although he does not maintain his own profiles or post on them himself, he is very attentive to the sites and pays close attention to the interactions in those spaces. He considers them an excellent resource for connecting with his constituency.

In many ways, Gutiérrez is a natural for use of social media. With his advocacy on behalf of liberal goals and on behalf of Latino people, social media provides an ideal place for him to gain leverage. Latinos in the United States are heavy users of social media, and the Latino population in the United States is youthful. In addition, liberal voting trends toward younger voters regardless of ethnicity.

With the hot-button issue of immigration as one of his most important battlegrounds, social media provide the right place for Gutiérrez to reach those who are passionate about the issue. Social media also provides a forum for opposing viewpoints and, therefore, a crucial window into the anti-immigration perspective.

As an activist and spirited debater, Gutiérrez is a natural for the video clip in the social media universe. Footage of his arrests on behalf of political causes garnered a huge amount of attention and made his work feel more immediate and relevant to activists struggling all over the United States.

Gutiérrez has mastered the Internet meme. His sense of humor and lack of fear have caused at least one clip of his debate tactics to go viral. When he compared photographs of Justin Bieber and Selena Gomez, who were dating at the time of Arizona's SB 1070, and asked on the floor of the House rhetorically which of them was more likely to be profiled and stopped in Arizona, that image spawned several memes. The example of Bieber, a white immigrant from Canada and Gomez, a Latina born in America, reflected criticism of the Arizona legislation. This act gained national fame in the social media realm, as did the offshoot memes that arose comparing William Shatner (Canada) and Edward James Olmos (America) and Geraldo Rivera (America) and Ted Koppel (a British-born naturalized American citizen).

OhMyGov gives Gutiérrez a media power rank of 58th among his 541 congressional peers. According to that site and others, he generates around 800 tweets in a typical week. Poleet reports Gutiérrez's Klout score as 54.

Gutiérrez also reacts to the social media actions of others. He called for the immediate dismissal of Puerto Rican official Heidi Wys for her racist birther tweet in response to a photo of First Lady Michelle Obama in which she directed President Obama to take his wife to his "homeland" of Kenya for her birthday.

H

Hacktivism

Hacktivism is a portmanteau of “hacking” and “activism” that describes the use of computers and computer and online networks as a means of activism or protest. The term is attributed to a collective known as Cult of the Dead Cow, where it was reportedly first used on a mailing list in 1996 as a tongue-in-cheek way to describe the group’s activities.

Hacktivism is commonly used to refer to a number of specific hacking methods for social or political means, including Web site defacements (whereby one obtains unauthorized access to a Web server and replaces or alters a Web page to convey a different message); denial of service (DoS) or distributed denial of service (DDoS) attacks (whereby a server is intentionally overloaded by saturating the machine with requests using one of several methods); uniform resource locator (URL) redirects (whereby a user is redirected to a different site than the one they intended to access); and information theft.

Techniques and Methods

The various techniques used by hackers are often compared to traditional, offline forms of civil disobedience. For example, Web site defacement is compared to graffiti, while DoS attacks have been compared to the lunch counter sit-ins

of the United States’ civil rights movement. Like many traditional forms of civil disobedience, many hacktivist activities are illegal.

History

The first known use of a DoS attack for political means occurred when, in an effort to oppose the United Kingdom’s (UK’s) Criminal Justice and Public Order Act of 1994, a San Francisco–based group sent huge volumes of e-mails in an effort to overwhelm UK government servers. Their act was effective and resulted in government Web sites being unavailable for more than a week.

Another early prominent example occurred in 1998, when a group known as the Electronic Disturbance Theater conducted DoS attacks on the Web sites of the Pentagon and the Mexican government to bring attention to indigenous rights in the Mexican state of Chiapas.

More recently, Anonymous—a collective of loosely associated hackers—brought hacktivism to the fore of mainstream discussion with a series of activities targeting a range of actors. Among the collective’s numerous targets are the San Francisco Bay Area Rapid Transit System (targeted for its perpetuation of a telecommunications ban amid local protests); the Tunisian and Egyptian governments during the Arab Spring protests; payment processors Visa and MasterCard (for enacting a blockade on financial

transactions to WikiLeaks); and U.S. government Web sites (on several occasions). Anonymous is often associated with WikiLeaks, though the two groups are separate.

Anonymous has also claimed responsibility for developing a tool known as Low Orbit Ion Cannon (LOIC), which enables individuals to conduct a DoS attack without much technical skill or knowledge.

Law

In Europe and the United States, hacktivist activities typically fall under laws pertaining to cybercrime. In Europe, the relevant statutes fall under the European Convention on Cybercrime, whereas in the United States, the Computer Fraud and Abuse Act of 2006 (CFAA) governs cybercrime. A number of other countries also have laws dealing with cybercrime.

Individuals engaged in hacktivism have been prosecuted in several countries. Raids resulting in the arrest of individuals associated with Anonymous and similar groups have been conducted in countries including Spain, Argentina, Chile, Colombia, the United States, and France.

In one known instance, a court ruled that in the context in which it was conducted, a DoS attack was legal. In 2001, several groups coordinated an attack against the German airline Lufthansa to protest the company's participation in deporting asylum seekers. The first criminal chamber of the Frankfurt appellate court later ruled that the demonstration was targeted at influencing public opinion, and its perpetrators could therefore not be charged with coercion, according to *EDRI-gram*.

Controversy

The tactics of hacktivists are a matter of debate among academic, hacker, and digital rights-promoting communities. Critics argue that certain tactics, such as DoS attacks, are in fact attacks on free speech. Methods used by hacktivists for political means are also used for other means; for example, during the conflict in Syria that began in 2011, a group calling itself the Syrian Electronic Army hacked and defaced numerous Web sites perceived to be in support of the Syrian opposition. In 2006, a company known as Blue Security used DoS in an attempt to rid itself of spammers,

resulting in a retaliatory attack against the company, destroying its business.

Those who are supportive of hacktivist tactics typically frame them as civil disobedience in an electronic environment, comparing online tactics with traditional, offline ones. Some supporters have argued for changes in laws to separate malicious forms of hacking from those associated with political protest.

Hagan, Kay

Kay Ruthven Hagan, who was born on May 26, 1953, is the junior senator (Democratic) for North Carolina. Considered a political centrist, she is a member of four Senate Committees for: Armed Services; Banking, Housing, and Urban Affairs; Health, Education, Labor, and Pensions; and Small Business and Entrepreneurship. As the chair of the Senate Armed Services Emerging Threats and Capabilities Subcommittee, her priority has been to ensure that federal policies

work for active-duty military, veterans, and their families, including the issues of veterans' health care and employment.

In recognition of the extensive military presence in North Carolina, Senator Hagan has traveled to Iraq, Afghanistan, Pakistan, and Kuwait to meet with military personnel. Senator Hagan, the mother of two daughters, also cosponsored the Lilly Ledbetter Fair Pay Act, which reestablished a fair rule for filing claims of pay discrimination based on race, national origin, gender, religion, age, or disability.

Constituent Services and Social Media

Since her Senate tenure began, Senator Hagan has made constituent services a trademark of her office. She opened five offices across North Carolina to serve constituents and hosts in-person "Conversations with Kay" town halls across the state. Each Wednesday, when the Senate is in session, she hosts North Carolinians in her Washington office for "Carolina Coffee," where constituents can discuss concerns and issues with Senator Hagan and her staff over coffee and Krispy Kreme doughnuts.

According to press secretary Chris Moyer, Hagan extensively utilizes Twitter, Facebook, Instagram, and YouTube on a regular basis to provide her constituents with legislative updates, personal insights, and behind-the-scenes visual content that might not be available elsewhere. She has used Twitter to post breaking news, such as her votes on upcoming bills or nomination confirmations. Hagan's support of marriage equality was announced on her Facebook page, which also features other means of engaging her constituents, such as asking for feedback on topics such as "Who was your favorite teacher?" to daily updates on Senate work, to inviting viewers to her Senate offices.

She has held "Twitter Town Halls," with the first in June 2012 focusing on North Carolina jobs and the economy, and one in April 2013 centering on military affairs. Anyone following @SenatorHagan can submit questions by including #AskKay with their tweet. Hagan's Senate Web site has added a badge designed to link veterans to the eBenefits Web site, providing them easy access to information about military benefits.

In February 2013, Hagan released a free constituent services app, which allows North Carolinians additional easy contact with her offices (she maintains five local offices), video and photo feeds, and real-time social media updates. All of this social media activity allows Hagan to extend constituent content in a daily, up-to-the-moment, personal way that may not be covered on the evening news or front page of local papers.

Policy Positions

Senator Hagan has articulated several key policy positions. The Senate Committee on Health, Education, Labor and Pensions, on which she serves, has come up with a public option—the community health insurance option—that assures that people with pre-existing conditions can still get access to health insurance.

She supports a balanced budget, favoring the pay-as-you-go principle, which requires that any increased spending be paid for, rather than burdening future generations for current spending. She has advocated the creation of a bipartisan deficit commission. As a member of the Health, Education, Labor, and Pensions (HELP) Committee, she is working on the Financial Literacy for Students Act, educational reform that provides states incentives to incorporate financial literacy into grade 6–12 curriculums. This bill reflects similar work she successfully passed in North Carolina. She has supported an increase in Pell grants for higher education, as well as increased investments in historically black colleges and universities. She is a cosponsor of both the Safe Schools Improvement Act and the Student Nondiscrimination Act, both designed to promote safe schools and prevent student discrimination.

A member of the congressional National Guard Caucus, Senator Hagan is working to provide support and training of citizen soldiers. As vice chair of the congressional Sportsmen's Caucus, she works to protect the interests of America's hunters, anglers, and trappers, including wildlife management. Hagan voted for the controversial Republican-created amendment that would have mandated the Keystone oil pipeline. The amendment failed to pass the Senate after heavy lobbying by the White House. Senator Hagan is a co-chair of the new Clean Energy Innovation Project, which is supporting research and

development investments in focusing on building a clean energy economy. She has also supported legislation that would require all registered sex offenders to register all of their Internet aliases with a federal database that would link with social networking sites.

Career

Before entering politics, Hagan worked for 10 years at North Carolina National Bank (a predecessor of Bank of America), rising to the vice presidency of the estates and trust division. She left the bank after the birth of her first child, becoming involved in local charities and active in Guilford County (NC) Democratic politics. Hagan directed Governor Jim Hunt's (D) local gubernatorial campaigns in 1992 and 1996.

Prior to her U.S. Senate run, Hagan was a member of the North Carolina State Senate from 1999 to 2008. In 1998, Hagan was elected to the State Senate from the 32nd District, defeating the incumbent. Because of redistricting, she later represented the 27th Senate District, with Democratic Senate President Marc Basnight as her mentor. Hagan secured money for several projects in her district, including funding for the International Civil Rights Museum, the International Furnishings Market, and Center City Park.

She cast votes in favor of a state lottery, a two-year moratorium on executions, and financial incentives for corporations to create new jobs. Her opposition to a constitutional amendment to ban same-sex marriage was based in her belief that there was already a state law in place against it. She co-chaired the Budget Committee, where she helped to generate five balanced state budgets.

Hagan's five two-year terms were exemplified by the creation of economic development tools and predatory lending laws and the filling of gaps in underfunded federal homeland security and law enforcement programs. Under her leadership, North Carolina extended health insurance to uninsured children, expanded preventive and primary care for uninsured patients in rural North Carolina, and fought to end insurance discrimination against mental health care. She provided strong support for the military, and was named by the nonpartisan North Carolina Center for Public Policy Research as one of North Carolina's Ten Most Effective Senators three times in a row.

The 2008 U.S. Senate race pitted Hagan against heavily favored, one-term incumbent Senator Elizabeth Dole (R), the first woman elected to the Senate from North Carolina, a state that did not ratify the Nineteenth Amendment giving women the right to vote until 1971.

Early on, there were no strong Democratic candidates to challenge Dole, and it appeared that she would win handily. Former Clinton White House Chief of Staff Erskine Bowles, who had lost two previous Senate races, Democratic Governor Michel Easley, Representative Brad Miller, and Attorney General Roy Cooper all chose not to run.

In early October 2007, Hagan announced that she would not run; however, later in the month, she reversed her announcement because of the urging of Hunt and Democratic Senatorial Campaign Committee Chair Charles Schumer (D-NY). In the five-way May 2007 primary, she was the only candidate who ran ads, and she won with 60 percent of the vote. Supported by former Governor Jim Hunt and then Governor Mike Easley, along with other establishment Democrats, she was also endorsed by the state chapter of the American Federation of Labor and Congress of Industrial Organizations (AFL-CIO), EMILY's List, the *Winston-Salem Journal* and *Charlotte Observer*, the Durham's People's Alliance, and the North Carolina Association of Educators.

With the two major party candidates now set, Dole was the early favorite, with a much larger fund-raising effort and greater visibility and name recognition. However, Dole had also been gone from the state as chair of the National Republican Senatorial Committee for 2005 and 2006, supporting Grand Old Party (GOP) candidates.

Hagan attacked her for spending so little time in North Carolina, accusing her of being a Washington insider because of her husband's (former Republican senator and presidential candidate Bob Dole) connections, saying that Dole was in the pocket of big oil companies because of their financial contributions, and too closely aligned with the Bush administration.

Attack ads by both sides played important roles. The national Democratic Senate campaign ran an ad with two elderly men seemingly

debating Dole's age (72); they were actually debating whether she was a 92 (her voting percentage for Bush positions) or 93 (her Senate effectiveness ranking according to Congress.org.) With a not-too-subtle age issue, the ad stuck.

At the same time, Dole attacked Hagan, calling her "Fibber Kay," a pawn of national Democrats (the Democratic party spent more on Hagan's senatorial campaign than any other in the 2008 cycle) and accusing her of supporting higher taxes. In the final week, Dole ran an attack ad that asserted Hagan had attended a Massachusetts fund-raiser in the home of a leader of the "Godless American Political Action Committee," which was a group that opposed declaring Christmas a national holiday. The ad questioned Hagan for taking "Godless" money, and wondered what promises she had made to the Godless Americans.

In retort, Hagan, a Presbyterian elder and Sunday school teacher, chided Dole for bearing false witness against a fellow Christian, and that said she should be ashamed for allowing such an ad to run. The Dole ad resulted in an increase of more than 3,000 people contributing to Hagan's campaign. Dole, initially favored, ran a controversial campaign that was marked by a negative association with the Bush White House and advertisements that falsely questioned Hagan's Christian faith. Hagan enjoyed a lead in October, which she never lost.

Hagan was also positively impacted by President Obama's strong statewide appeal. The large increase of younger voters and African American voters, prompted by Obama's campaign contributed, but Hagan garnered a larger percentage of votes than the majority of North Carolina Democratic candidates. Kay Hagan was elected to the U.S. Senate, winning by an unexpectedly strong margin of 53 percent to 44 percent. Hagan also garnered 100,000 more votes than President Barack Obama, running 3 percent ahead of his total. She won 71 percent of voters under 30. Dole won 67 percent of white evangelicals, but 7 percent less than McCain within the same group.

The *Washington Post* called Hagan's the best Senate campaign in that cycle, noting that she entered the race a virtual unknown who had charisma, a no-nonsense approach to what needed to be done to beat Dole, and the ability to stay on message despite attacks.

Early Life

Hagan's public service passion was impacted by her early life. Her maternal uncle is Lawton Chiles, the former Florida governor (two terms) and U.S. senator (three terms). According to various reports, Hagan has many early political memories placing bumper stickers on cars in support of her uncle's campaigns. In the 1970s, as a Senate intern, Kay Hagan operated the elevator that carried senators to the chamber. She also has deep military roots, her husband is a U.S. Navy Vietnam veteran, her father-in-law was a two-star Marine general, her father and brother both served in the U.S. Navy, and two nephews have served in Iraq and Afghanistan.

Senator Hagan earned her B.A. in American studies from Florida State University (1975) and her J.D. from Wake Forest University (1978). She is married to Charles Tilden "Chip" Hagan III, and is the mother of three children (Jeannette, Tildon, and Carrie).

2014 Campaign

In November 2012, Senator Hagan announced that she would seek re-election in what is projected to be a hard-fought campaign, given the changing tenor of state politics. North Carolina shifted its 15 electoral votes to Republican Mitt Romney rather than Democrat Barack Obama in the 2012 presidential election, despite the Democratic National Convention being held in the state. It was only one of two states that switched back to Republican after supporting Obama in 2008. Since the 2008 campaign, North Carolinians have elected Republican governors and three members of the House of Representatives. Just prior to the November election, the Democratic polling group Public Policy Polling reported that only 35 percent of Democrats approved of the job that Hagan was doing, but in December, that had risen to 40 percent.

Crossroads GPS ran radio spots following the election that targeted potentially vulnerable Democratic Senators up for re-election in 2014 in five states, including Hagan. The ads—all running in states President Obama eventually lost—hit the president on "massive tax increases," "even more debt," and a "one-sided plan" on the fiscal cliff before telling listeners to call their senators and tell them "Washington needs to stop the

spending and give us a balanced plan.” Political science professor and pundit Larry Sabato also noted that, in North Carolina, incumbency does not mean much; the Senate seat has a history of going back and forth between parties. However, in late 2012, Public Policy Polling showed Hagan with a lead of 46 to 34 percent over potential leading candidate and North Carolina Speaker of the House Thom Tillis (R).

Hard Place Theater

The brainchild of Clay Shirky, Hard Place Theater was a New York City theater company designed as a vehicle for Shirky’s unique projects. Each piece produced by Hard Place Theater was non-fiction and composed entirely from actual, found historical materials. Government documents, cultural records, and transcripts from a wide variety of official proceedings were all fair game for Hard Place Theater productions.

Clay Shirky graduated from Yale University in 1986, with a bachelor of fine arts. He then moved to New York City, and in the 1990s, he established Hard Place Theater. At that time, Shirky also served as vice president of the New York chapter of the Electronic Frontier Foundation; this organization provided legal assistance in the realm of consumer rights, free speech, innovation, and privacy.

Perhaps the best-known piece produced by Hard Place Theater was “Excerpts From the Attorney General’s Report on Pornography,” which used the 1986 Meese Commission Report authored by the U.S. Department of Justice. This six-actor show depicted the congressional hearing with its listing of bawdy, obscene pornography titles (more than 2,300 were documented in the actual commission) and testimony.

Presentation of the nonfiction text ranged from straightforward delivery to emotional, ironic, and humorous interpretive deliveries. Actors often spoke over each other, and the overall focus was on the questions raised in the report, more than any answers given. Testimony on rape, violence, pedophilia, and free speech mingled as the polar nature of American society was emphasized throughout.

The script (funded by the Justice Department, at least in its original form) interspersed testimony from rape victims and religious figures with titles of pornographic films. The frame-by-frame breakdown of *Deep Throat* from the report figured prominently in the stage production, and the show saw actors using dolls to reenact the breakdown.

Shirky went on to become the first professor of new media at Hunter College, a fellow at the Berkman Center for Internet and Society, an associate arts professor within the Interactive

Hard Place Theater's Clay Shirky at a rally for Internet freedom on January 18, 2012, in New York City. Shirky is now an influential scholar of issues related to social media and the Internet.

Telecommunications Program (ITP), and a distinguished writer in residence in New York University's Journalism Department. He also taught new media and public action as the Edward R. Murrow visiting lecturer at Harvard University in 2010.

A generally acknowledged authority on the effects of Internet and social media on society, Shirky is a devoted social media user and participant as well as a researcher. He published the book, *Here Comes Everybody: The Power of Organizing Without Organizations*, in 2008. He pursues interactions between people and social media in his 2010 book, *Cognitive Surplus: Creativity and Generosity in a Connected Age*.

Hashtag

A hashtag is a symbol used to categorize, highlight, or tag topics and keywords contained in a single tweet on Twitter. A hashtag is signified by the use of the pound sign (#), called a hashtag on Twitter, followed by the word or words being tagged. For example, a tweet about President Barack Obama might contain the hashtag #Obama. Hashtags have become increasingly useful as a way to organize tweets about a specific topic, event, person, and so on. Event organizers, politicians, celebrities, and other Twitter users will select unique hashtags for their events or topics and encourage Twitter users to include the hashtags in their tweets (such as #GOP2012 for the 2012 Republican National Convention). The most popular hashtags, in terms of the number of uses, become trending topics.

Anyone can create a hashtag on Twitter. To create a hashtag, a person simply types # followed by a word or words (with no spaces

between words). Numerical characters are also allowed. Tweets can contain multiple hashtags, but they typically contain no more than three hashtags. For instance, a tweet about President Barack Obama's speech at the 2012 Democratic National Convention might use the hashtags #Obama and #DNC2012.

Event organizers who know the value of social media will often create a hashtag prior to an event and ask all participants to include the hashtag in their tweets. The more tweets using a hashtag, the more exposure for an event, person, or topic. Users can search for a specific hashtag and find all of the tweets that have included this tag. A person with interest in the Iowa caucuses could search for the hashtag #IACaucus and see all of the tweets using the hashtag.

Anyone can use any hashtag in a tweet, even a hashtag that is unrelated to the tweet. Hashtags are also not proprietary, meaning that anyone can use a hashtag for their event, even if it has been used previously or is currently being used in another context. For example, two organizations with the abbreviation ABC might both use the hashtag #ABC in their tweets. Twitter users searching for tweets about the American Broadcasting Company using #ABC might find unrelated tweets because others are using the hashtag for different purposes. For that reason, hashtag creators should search for unique hashtags to use. The more a hashtag is used, and the more specific its defining parameters, the less likely it will be used by others.

Although created for and primarily used within Twitter, hashtags are also not exclusive to Twitter. Other online outlets also use hashtags, including Instagram and Google+. With the use of services that automatically posts tweets to Facebook profiles, hashtags are also showing up on Facebook, one of the world's most popular social networking sites.

The use of hashtags has allowed politicians, political movement leaders, news outlets, and the general public to direct political dialogue toward topics of interest. Hashtags also highlight topics that many people are discussing. For example, the Twitter blog reported more than 4 million tweets using the hashtag #GOP2012 at the close of the 2012 Republican National Convention. This indicates at least 4 million unique

tweets with the Grand Old Party (GOP) convention as a topic.

Event organizers can also use hashtags to interact with an audience during a live event. Television news personalities often ask users to tweet feedback and thoughts using a particular hashtag. Twitter users can easily move political dialogue toward various topics by using hashtags and encouraging others to use them. Politicians and political parties also use hashtags to advance a particular agenda and highlight a candidate or event. The success of the #GOP2012 hashtag is one example.

Hashtags are used to encourage a meetup, an online or offline gathering of people. The Occupy Wall Street movement is one example of using a hashtag, #OccupyWallstreet, to encourage offline gatherings. U.S. President Barack Obama has used Twitter hashtags to connect with the public in online gatherings, sometimes called a "tweet-up." In partnership with Twitter, the White House held the first Twitter @Townhall at the White House. Using the hashtag #AskObama, users submitted questions that were then answered by President Obama.

The general public, more specifically those who use Twitter, can voice their concerns and thoughts via tweets and classify them using hashtags. Policymakers and politicians who hope to gain a better understanding of the sentiments of the public can monitor the cumulative effect of those tweets by examining the hashtags.

Hatch, Orrin

Orrin Grant Hatch is the senior senator from Utah, and in 2013, he became the longest-serving Republican in the current U.S. Senate. Although Hatch came to the Senate a quarter of a century before the founding of social media sites, the senator and his staff are among the most active users and advocates of new social media technologies in politics. Orrin Hatch was born in Pittsburgh, Pennsylvania, in 1934. He attended public high school, lettering in basketball and boxing. He was the first in his family to attend college, graduating from Brigham Young University in 1959.

Hatch paid his way through law school, working as a janitor, lathe plasterer, and college residence hall monitor, receiving his degree from the University of Pittsburgh Law School in 1962. He was a dues-paying member of the Wood, Wire, and Metal Lathers Union. Senator Hatch is a Mormon. His ancestors were early converts to this faith. Hatch served as a Mormon missionary in the American midwest and has held a variety of positions in his church, including bishop. Hatch is the best-known Mormon public figure in America, after Mitt Romney. He and his wife, Elaine, have 6 children, 23 grandchildren, and 10 great-grandchildren.

After running a successful private law practice in Pittsburgh, Hatch moved to Salt Lake City in 1969. His autobiography, *Square Peg: The Confessions of a Citizen-Senator*, recounts how he joined the Reagan revolution during the mid-1970s when evangelical Christians and Mormons began to flock to the Republican Party's pro-life agenda. Hatch was one of the first members in this movement to be elected to the Senate. A political novice and antiestablishment figure, Hatch defeated a

three-term incumbent, Democrat Frank Moss, by a nine percent margin of victory in 1976. He has won re-election six times, with an average winning margin of 35 percent. In 2012, Hatch defeated the first serious challenger to his Senate seat, a Tea Party insurgent in the Utah Republican Senate primary, and returned to the Senate in 2013 to start his seventh and final (he says) term of office.

While in the Senate, Hatch was considered as a possible nominee to the Supreme Court during the Ronald Reagan and George W. Bush presidencies. He made a short-lived bid for the Republican presidential nomination in 2000. Hatch has served as the chair or the ranking minority member on the Senate Judiciary Committee, and is the ranking Republican member of the Senate Finance Committee, perhaps the most powerful committee in the Senate. He will serve as the chair of this committee, and will become the president pro tempore of the Senate if the Republicans win a majority of the Senate in the 2014 election. The president pro tempore is third in succession to the office of the president, after the vice president and the speaker of the House of Representatives, and presides over the Senate in the absence of the vice president.

Hatch has been a champion of conservative nominations to the federal judiciary during his membership on the Senate Judiciary Committee. As the longest-serving member of the committee, Hatch maneuvered the controversial Clarence Thomas confirmation to the Supreme Court. The senator voted to confirm, however, liberal nominees he believed to be worthy candidates, including Ruth Bader Ginsburg and Stephen Breyer. He has participated in the confirmation of all the current justices of the Supreme Court. Hatch helped to form the Federalist Society, the nation's leading association of conservative lawyers. Hatch also serves on the Senate Select Committee on Intelligence and the Joint Committee on Taxation. He is a director of the Holocaust Memorial Museum in Washington, D.C. Harvard University's Center for Public Leadership and *U.S. News & World Reports* ranked Hatch as one of America's top leaders in 2009.

Legislation

Hatch's 36 years in the Senate have put him at the forefront of several important legislative

initiatives. He coauthored one of the first significant antiterrorism bills in reaction to the 1995 bombing of the Oklahoma City Federal Building. He won the extension of the Foreign Intelligence Surveillance Act in 2008, a law criticized by the American Civil Liberties Union as a threat to civil liberties. He supported the Bush administration's Economic Stabilization Act and the Troubled Asset Relief Program (TARP) acts of 2008, but says that he now regrets his vote for TARP. Hatch has proposed a balanced budget amendment to the U.S. Constitution 17 times. The amendment would cap federal spending as a percentage of the nation's gross domestic product and require a two-thirds vote in Congress to raise taxes, unless there is a formal declaration of war. Congress came within one vote of approving the amendment in 1997. Hatch opposed President Obama's health care proposal, the first senator to challenge the constitutionality of the individual health insurance mandate. He believes that it exceeds Congress' interstate commerce power. The Supreme Court agreed with Hatch in *National Federation of Independent Business v. Sebelius* (2012), although a majority of the court upheld the mandate under Congress' taxing powers.

The senator was a leading champion of the Medicare prescription drug benefit known as Medicare Part D, which was enacted in 2003. He helped win passage of the Ryan White Acquired Immune Deficiency Syndrome (AIDS) Care Act of 1990. He joined Democratic Senator Richard Durbin (IL) in an unsuccessful effort to pass the Development, Relief, and Education for Alien Minors (DREAM) Act in 2001. The act would have established a process to give the children of undocumented immigrants access to American citizenship if they graduated from an American high school or served in the U.S. military. He was also instrumental in authoring the Violence Against Women Law, a bill designed to protect women and children against domestic assault, and the law establishing the America's Missing: Broadcasting Emergency Response (AMBER) alert system.

Hatch is a supporter of stem cell research, bills to strengthen state powers under the Tenth Amendment, and congressional statutes that seek to overturn Supreme Court decisions that Hatch fears infringe on the freedom of religion.

He coauthored a bill limiting the regulation of dietary supplements with Democratic Senator Tom Harkin (Iowa) in 1994. Utah is the center of the dietary supplement industry in the United States. Hatch was also a long-term friend of liberal Democratic Senator Ted Kennedy (Massachusetts), partnering with Kennedy in passing the State Children's Health Insurance Program (SCHIP), guaranteeing health coverage for low-income children in 1997.

OpenCongress.org, a nonpartisan Web site that tracks how often members of Congress vote with their party, ranked Hatch 26 among the 47 current Republican senators. He voted with his fellow Republicans 90 percent of the time in 2012. Hatch's life outside of the Senate is as interesting as his service within it. He is an accomplished piano, organ, and violin player. He is also a songwriter and recording artist of religious music, including a song celebrating Hanukkah. He appeared in a cameo role in the 2000 Oscar-winning film, *Traffic*.

Social Media Use

While 2004 is considered the Internet's breakout year in presidential elections, after Howard Dean's successful use of his Web site for online fundraising, the first overt political use of the Internet may be Usenet, the online network that began in 1979. By 1986, political groups began to intensively use e-mail and Internet bulletin boards. Both major parties and at least two of the minor party presidential candidates had campaign Web sites in the 1996 election. Most congressional candidates also had Web sites. However, these Web sites tended to be little more than digital brochures describing candidates' backgrounds and issue positions. Hatch was elected to the Senate before the rise of the Internet. He has become, however, one of the most fervent champions of these new technologies in today's Senate. His Web site (hatch.senate.gov) was one of the first established by a senator. During his 2000 run for the Republican nomination for president, Hatch highlighted his campaign's prowess in its use of the Internet during a primary debate. This was probably the first time that any presidential candidate has made the use of the Internet a campaign issue.

Hatch's Facebook page (www.facebook.com/OrrinHatch) became active in 2008, and has more

than 23,000 “likes.” He was an early adopter of social networking sites, and he helped orchestrate the Republican gains in the Senate during the 2010 congressional campaign through traditional and social media techniques. Hatch’s state and Senate offices are two of the most effective social media operations in Congress. The senator interviewed Facebook founder and CEO Mark Zuckerberg in an interactive discussion about the emergence and impact of social media on innovation and public policy in 2011. Hatch invited Zuckerberg in Hatch’s role as the chair of the Senate Republican High Tech Task Force, but also, journalists suggest, as a way to enlist young people’s support during a tough 2012 re-election campaign. He has chaired this taskforce since 2009, and serves as the liaison between his party in the Senate and the technology industry.

Hatch’s career in the Senate shows how new social media technologies have affected campaign politics. Reddit and Twitter “wars” broke out during his 2012 Utah Republican Senate primary campaign, and continued during the general election. Social media services such as Reddit are social networking sites that permit their members to sponsor forums on any topic. Supporters and opponents of Hatch flooded the sites with their accusations, complaints, and comments. The senator recognized early what others are now confirming. Adult users of social media tend to be more engaged in political activity than adult nonusers. A 2012 Pew Report on the Internet found that almost two-thirds of adult users reported that they used social networking to express their political views, promoted materials on social issues, or followed political candidates and public officials on Facebook, Twitter, and other social media sites. Google reports that more voters use their mobile devices for political news than they use traditional print media such as magazines and newspapers.

Social media and networking sites not only offer public officials easier access to the politically connected population, but can also serve to push voters to the ballot booth. Facebook messages moved more than a third of a million people to vote in the 2010 election, according to a study published in *Nature*. A nonpartisan social message urging people to vote and post that they had voted appeared on Facebook on Election Day.

The message was more likely to result in higher voter turnout the closer the poster’s relationship was to the viewer. It is not only elected officeholders and political candidates who seek to advance their agendas on social media sites. Hatch and Republican Senator Jerry Moran (Kansas) chastised Treasury Secretary Timothy Geithner for using Facebook and Twitter to encourage members of the public to pressure their representatives in Congress to increase funding for the Security and Exchange Commission in 2012. The Treasury Department had placed several posts on Twitter, YouTube, Flickr, Facebook, and the department’s blog championing more funding for important government financial agencies.

Hatch’s early adoption of Internet and social media technologies can be traced to Utah’s role as one of the nation’s most technologically advanced regions. The Salt Lake City area is called the Silicon Slopes in recognition of the more than 4,000 information technology firms, employing more than 66,000 people in the state. Animation film company Pixar, home video gaming pioneer Atari, Adobe Systems, Novel, WordPerfect, and Iomega were all founded in the state.

Conclusion

Senator Hatch’s willingness to adopt these new technologies demonstrates how a long-serving senator appreciates the value of cutting-edge electoral and communication technologies. He uses social media to solicit donations, remind supporters of campaign events, and share and post videos portraying his positions. His staff uses Instagram and Flickr as digital scrapbooks to highlight events on the campaign trail and in the Senate. His office employs the biggest sites, such as Facebook and Twitter, to canvass large numbers of constituents. Senator Hatch and his staff follow Twitter tweets and Facebook posts to gauge public response to campaign activities and legislative initiatives. Senator Hatch’s reliance on social media and networking will increase as his constituents become more accustomed to using social media and networking to communicate their concerns and preferences and hold their elected officials accountable.

Hate Speech, Online and Social Media

Hate groups, defined as extremist organizations that espouse prejudice and separation based on race, religion, gender, or sexual identity, were early and enthusiastic adopters of the Internet as a tool of organizing and communication. White supremacist groups have used the Internet since 1985, when White Aryan Resistance leader Thomas Metzger founded an electronic bulletin board service that rallied against blacks and Jews. Since that time, organized extremist groups have primarily used the Internet for three main activities: to openly express their viewpoints without the opposition or consequences they would encounter elsewhere, raise money, and grow their organizations by recruiting new members. As with any affinity group, the Internet appeals to these groups because it allows members to connect across legal and geographic boundaries, finding common ground, regardless of where they live. For those engaged in activities that violate widely accepted social norms, the Internet and social media also provide privacy

and anonymity. Popular culture, including both fiction and music, is also a key part of modern White Supremacy movement, and the Internet has helped create new avenues for sales and distribution of music espousing separatist and supremacist beliefs.

Despite this organizational activity, online hate speech is difficult to define because the concept encompasses a broad range of communication, much of which is not connected to any particular organization, and dissent and freedom of even unpopular expression are firmly entrenched in American law and culture. Hate speech is language that disparages or attacks a group of people based on a primary aspect of social identity such as race, religion, ethnicity, gender, sexual orientation, or disability. Speech codes are controversial and hard to enforce, even in the private sector. Freedom of speech is enshrined in the Constitution and is central to national identity.

Political speech is the most highly protected category, even when that speech conflicts with other American values of tolerance and equality. In keeping with that principle, there can be no legal restriction on speech that is considered political in nature, and in the United States, the courts have tended to interpret "political" in broad terms. This sets the United States apart from countries in Europe, which have enacted restrictions on speech in reaction to concerns about the role of communication in the rise of fascism in the World War II era. In Germany and Austria, for example, denying the existence of the Holocaust is considered hate speech, is illegal, and is grounds for denial of an entry visa.

As a result of this tension between the desire to protect the rights of women and minorities and the desire to protect free speech, hate speech is largely defined by the different organizations that represent the types of people most often stigmatized by extremist groups. The most prominent groups involved in this type of advocacy include the Anti-Defamation League, with the mission to combat offenses against the Jewish people and monitor anti-Semitic speech; the Southern Poverty Law Center, which polices race-based speech and hate crimes; the National Organization for Women (NOW), which advances gender equality and monitors offenses against women; and the Human Rights Campaign (HRC), which

A protester holds a rainbow-lettered sign meaning “end hate” in HTML at a November 2008 Dallas, Texas, protest against the passage of Proposition 8 banning same-sex marriage in California. Online hate groups are difficult to define and count, but a Southern Poverty Law Center report found a sharp increase in extremist antigovernment groups in the United States, from 149 in 2008 to 1,360 in 2012, or a change of 813 percent, corresponding to President Barack Obama’s first term in office.

advocates on the behalf of gay, lesbian, bisexual, and transgender Americans.

Responses and Remedies

The Internet presents new challenges and opportunities for responding to hate speech. With First Amendment protections and the borderless nature of the Internet, legal remedies against hate speech would be difficult to legislate and impossible to enforce. As a result, rather than seeking legal remedies to minimize hate speech online, groups like the ADL and NOW apply pressure to companies that host sites associated with hate groups or hate speech. Though not illegal, the types of speech that these organizations target may violate a company’s individual terms of service agreements, the document outlining the rules of the road for a particular social network or community. On social sites like Twitter, Facebook, and media sites that host comments, users often agree to conform to certain rules when they join a community or register to post comments. These policies help to

maintain a certain environment on the site that is a reflection of the company’s brand, but sometimes conflicts with the idea of the Internet as a new public sphere. Public opinion surveys show that most Americans agree that the Constitution affords the Ku Klux Klan the right to assemble and speak. Even those who find their views repugnant may defend their right to express them in the town square. Online, however, the private companies that own and operate social networks require conformity to certain codes of conduct. These corporations impose standards that protect their image and reflect the expectations of the community.

Another remedy that some advocates have sought is to pressure advertisers to decline to place their marketing on pages that contain content they consider hate speech. Advocacy organizations have successfully applied pressure for companies to withdraw from shows that they believe include hate speech through campaigns like Stop Beck, aimed at Glenn Beck; and Stop Rush, aimed

at Rush Limbaugh. In 2013, Fox News executives admitted that the Stop Beck campaign had cost them significant amounts of advertising revenue and contributed to their decision to discontinue Beck's contract. In 2013, women's groups coordinated a campaign criticizing Facebook for hosting pages that promote sex trafficking and violence against women. When Facebook responded that the pages in question did not violate their terms of service, these women's groups placed more focus on appeals to advertisers.

Cyberhate in a Postracial Era

Hate groups have flourished online. By 2000, HateWatch had identified 400 Web sites linked to organizations they designated as hate groups, and leaders of organizations openly acknowledged the integral role that online community and communication play in their organizations. An analysis of messages posted on these sites characterized much of these communications as congenial. They focus on community building, pride, identity, and the prestige of their membership, rather than exclusively the core tenets of the organizations.

In addition to facilitating the distribution of hate speech cross-border organization among hate groups, the Internet also enables more effective measurement of these types of activities. Based on Web site traffic, researchers believe that the election of the United States's first black president helped to reenergize the backlash that had already been in progress for decades. Traffic to the white separatist site Stormfront.org, in particular, increased so dramatically following Obama's election that its servers crashed. A similar "Obama effect" occurred in 2012 after President Obama's re-election.

The topics and loci of American hate speech in the 21st century are illustrated in the Geography of Hate, a large-scale content-analysis project that maps the geographic origins and prevalence of hate speech on Twitter. Automatic coding identified tweets containing at least one hate word related to race, disability, or sexual orientation. Human coders then reviewed each of the resulting tweets to determine whether the tweet was negative.

Complicating matters, as one can see in the Geography of Hate research project and Stop Beck campaigns, distinctions between hate and

other types of speech highly depend on the historical and social context. Ideas that are considered repugnant in 2013 may have been mainstream just a few decades ago, and much of the speech identified as hate speech by these groups reflects reactions to the social movements and change of the 1960s and 1970s. For example, the concept of homophobia is fairly modern. Although racial and religious defamation has attracted the most attention historically, in the 21st century, hate speech directed at sexual orientation and gender has generated a great deal of attention. This is also the source of some debate because these latter categories of identity do not enjoy the same legal protections as race and religion, public opinion on these issues is greatly in flux, and religious groups argue that expansion of antidiscrimination protections to sexual matters would violate their religious freedom.

Several scholars, including Jessie Daniels, have explored the idea that hate speech is not so isolated from mainstream discourse around race and gender. Consistent with feminist and anti-racist scholars like Jackson Katz, these writers find thematic continuities between what is defined as hate speech aimed at sexual, religious, and racial minorities and more mainstream conservative political discourse around race, gender, and sexual orientation.

In the United States, extreme and more mainstream political rhetoric on the right share the view that social movements like feminism, the civil rights, and the lesbian, gay, bisexual, and transsexual (LGBT) movements have expanded the rights of minorities by infringing upon those of the majority. Hate groups capture these rather widespread resentments and sense of grievance and situate them within rhetoric of zero-sum gain group competition, warfare, and violence. Though the speech is protected, these groups promote activities that fit the federal guidelines for hate crime. The Federal Bureau of Investigation uses Congress' definition of a hate crime as an offense involving group bias against a religion, gender, disability, ethnic origin, or sexual orientation.

The fluidity of the barriers between hate speech and other political discourse is also demonstrated in the activities of antigovernment groups, which aim their violence and activism at the perceived

excesses of the federal administration. While hate crimes have decreased or remained roughly stable, online discourse and other activity among groups that fit the broader definition of extremism related to government authority multiplied eight-fold from 2008 to 2012. These groups tend to believe that the federal government wants to curtail their rights. For them, President Obama serves as a primary manifestation of that.

Similarly, under Obama, hardcore groups now number 1,000, but extremist antigovernment groups have dramatically grown. According to the Southern Poverty Law Center (SPLC), “The number of Patriot groups, including armed militias, has grown 813 percent since of the Obama was elected—from 149 in 2008 to 1,360 in 2012.” Even these statistics, however, are disputable because conservative groups take issue with SPLC’s definitions and argue that they seek to marginalize or even criminalize organizations engaged in normal political debate about the proper size and role of government.

HeadCount.org

HeadCount.org is a nonprofit, nonpartisan voter registration organization aimed at music lovers. The New York City–based group connects musicians with its purpose of encouraging those who are eligible to participate in the experience of American democracy, and its goal to add names on the rolls. HeadCount was founded in 2004 by Marc Brownstein, bass player for the band Disco Biscuits and Andy Bernstein, a journalist, music lover, and an author of the Phish guidebook, *The Pharmer’s Almanac*. Along with a team of volunteers, the two located their work with this project at physical sites where they often crossed paths with unregistered voters: on parking lots, in vendor aisles, and at beverage tents. They similarly utilized virtual venues popular with that particular demographic via Facebook, Twitter, Instagram, and other social networking platforms. In cooperation with partner musicians, HeadCount members distributed information, held raffles for autographed memorabilia or VIP music experiences, and drew upon the identification audiences have with the people who play the music they love, all in service of greater voter participation.

This approach proved successful, and in the following years, HeadCount registered hundreds of thousands of live music fans across the country. While the organization began in the jam band scene, the scope of artists and acts among its 80-plus partner musicians ranges within a variety of tastes and tones, including Blues Traveler, Bonnie Raitt, The Decemberists, Greensky Bluegrass, Jay-Z, John Mayer, Maroon 5, My Morning Jacket, Neil Young, Pearl Jam, Phish, and Wilco. These collaborations foster existing relationships with fans, create new audiences for bands, and provide publicity for causes and artists alike. HeadCount also employs their partner artists’ e-mail lists to distribute pertinent materials so that any given campaign can reach more than 1 million in-boxes.

A network of helpers is crucial to the success of HeadCount, with dozens of people volunteering as regional coordinators or team leaders and working in artists relations or new media. Many of these individuals engage in particular projects on the Web, and they remain connected, organized,

and energized with one another via social media. These are the channels through which the organization maintains awareness, energy, and the funding needed to flourish.

Many of the most successful HeadCount campaigns have been deployed via the Web and social media platforms, including one that occurred during the first full election cycle after the organization launched. On November 3, 2008, HeadCount hosted musicians such as Joss Stone, Phil Lesh, Robert Randolph, and Questlove for a Get Out the Vote Party at the Highline Ballroom. Webcast live nationwide via iClips, this was the first event of its kind to combine live audio and video streams to produce a national voter awareness and registration event, one with the potential to move thousands of people to the polls on the next day.

In 2012, HeadCount registered at least 103,340 voters at more than 1,170 events in more than 70 cities, marking its most successful year to date. One element of its national campaign around the November elections was the Clipboard Project, which took photographs of roughly 200 music and entertainment stars holding HeadCount's Register to Vote clipboard. These images were then tweeted, Facebooked, and linked to the official Web site to be pinned, Tumblr'ed, recommended on Google, StumbleUpon'ed, shared on Digg or Reddit, or otherwise circulated. 50 Cent, BB King, Cyndi Lauper, Edward Norton, John Legend, Ke\$ha, Lewis Black, Marlon Wayans, Sarah Silverman, Stephen Colbert, Susan Sarandon, Tenacious D, and Warren Haynes represent a cross-section of the celebrities who participated in the project. Facebook posts from Dave Matthews and Linkin Park garnered more than 18,000 and 100,000 "likes," respectively.

HeadCount's Web site also hosts a current blog where volunteers, staffers, board members, and partner artists can post content to share with viewers far and wide, allowing information to quickly circulate on the virtual music scene. Between elections, it discusses current issues of interest to its members, such as food and farm policy, Gulf Coast recovery, human rights, and sustainability and climate change.

Bernstein and Brownstein still serve as HeadCount cochair and as members of the board of directors, the latter of which boasts a roster that

recalls an issue of *Rolling Stone* in its coverage of prominent musicians, industry leaders, and activists like Bob Weir of the Grateful Dead and Furthur, John McCrea of CAKE, Stefani Scamardo of Hard Head Management, and Peter Bahouth of the U.S. Climate Action Network. A list of festivals and promoters affiliated with HeadCount is equally diverse, and includes Austin City Limits, Bonnaroo, High Sierra Music Festivals, Horning's Hideout, Mountain Jam, Outside Lands, and PDX Pop Now!

Health Care

In 2010, President Obama signed into law the Patient Protection and Affordable Care Act, often referred to as ACA, which many believe is the most significant social policy enacted in decades. After an overview of the legislature and its historical and political significance, the entry explores the role social media played throughout the health care reform between 2007 and 2012.

Affordable Care Act

The overall goals of the health care reform are to expand health insurance coverage to millions of

uninsured Americans, to improve access to and quality of care, and to ultimately control rising health care costs. Some of the law's major provisions include the following:

- Requiring that most U.S. citizens and legal residents have health insurance by 2014, also known as the individual mandate.
- Creation of state-based exchanges through which individuals can purchase coverage, with subsidies available to lower-income individuals.
- A major expansion of the Medicaid program to cover all non-Medicare-eligible individuals with incomes up to 133 percent of federal poverty level (FPL).
- Requiring insurance plans to provide coverage, regardless of pre-existing conditions.
- Closing the Medicare prescription “donut hole.”

ACA aims to provide health coverage to more than 30 million uninsured Americans beginning in January 2014. It is the biggest overhaul of the \$2.8 trillion U.S. health care system since the initiation of Medicaid and Medicare in the 1960s. To say that it has been a challenging process to get the law passed and implemented is a gross understatement.

Health care reform became a point of contention in the 2007 Democratic primary election when the candidates presented different plans for achieving universal coverage. In November 2008, newly elected president Barack Obama started to push for a major overhaul of the health care industry, an effort that would lead to his signature legislature, the ACA. In 2009 there were many controversies and complications, and even though the president signed the ACA into law in March 2010, the tumultuous saga continued. Debates over the legality of ACA and the states' decisions to participate in the Medicaid expansion or opt out of this key component of the law, for instance, are some examples of the complications that confused the public during the implementation stage. Social media have provided a platform for public information and engagement throughout this process.

Social Media Events

From the early days of the law's inception, key turning events in health care reform have been shaped by social media events. The “death panel” controversy that significantly threatened the law, for instance, took momentum with a 316-word Facebook post by Sarah Palin, former governor of Alaska.

Betsy McCaughey, a former lieutenant governor of New York, first brought attention to this issue in mid-July 2009, claiming that the ACA would require Medicare patients to have counseling sessions that would tell them how to end their lives sooner. Though the American Association of Retired Persons (AARP, a nongovernmental, nonprofit organization for the elderly) as well as other sources debunked the claim, opponents of the law continued the discourse in their attacks of the ACA. However, the general public only started to take note of the controversy after Sarah Palin's August 7 Facebook post, in which the term *death panel* was first used. Her message that neither her parents nor her baby with Down syndrome should have to stand in front of a “death panel” where bureaucrats would get to decide whether they were worthy of health care certainly struck an emotional cord with the general public.

Though later voted on Truth-O-Meter (now PolitiFact.com) as the biggest political lie of the year, this controversy took hold: A Google search with the term generated 275 million results in November 2012; the top 50 newspapers across the nation published more than 700 articles on the claim in the five weeks after Palin's post. Brendan Nyhan reported a 2010 poll, which showed that after it spread, about 85 percent of Americans were familiar with the “death panel” charge, and about 30 percent of those who knew of the attack thought it was true. The section of the bill Palin was referring to, which would have paid physicians for providing voluntary end-of-life counseling to Medicare patients, was removed and not included in the final law.

The June 2012 Supreme Court ruling on the ACA, another monumental event in the health care reform saga, was connected to another social networking medium, Twitter. Shortly after the court's ruling that the law was constitutional, Twitter volume peaked at 13,000 tweets

per minute, which more than tripled from the record-breaking Twitter activity in March 2010 when the U.S. House passed the legislation. Both campaigns used the opportunity to engage supporters on Twitter during this key moment. Mitt Romney's tweet tied to the ruling—"If we want to get rid of Obamacare, we're going to have to replace @BarackObama"—was one of the biggest tweets of the day, which generated more than 4,000 retweets. These statistics would pale in comparison to the Twitter activity that the nation later saw on Election Day 2012, when more than 300,000 tweets were sent per minute at the height of the site's traffic. This is yet another poignant example of the ever-evolving role that social media play in shaping political events and redefining civic engagement.

Advocacy Organizations

Various constituency organizations saw the health care reform as an opportunity for advancing their agendas through policy advocacy, and social media provided a forum for such efforts.

On health care reform, women are both key targets for campaign messages and potential messengers. Momsrising is an online advocacy organization, which according to its Web site, "takes on the most critical issues facing women, mothers, and families, by mobilizing massive grassroots actions," using its interactive online forum. To defend and promote ACA, the Web site asked its millions of followers for personal stories about how the new law was helping their families. Dawn Josephson, a mother from Florida, shared her story about how, for the first time, her insurance did not exclude her son's pre-existing eye condition, referring to one of ACA's more popular clauses. The White House picked up Dawn's story, as did the major media outlets. She shared her story in person with President Obama, an event that received extensive media coverage via traditional outlets such as the *Washington Post* and CNN.

Proponents of social media's democratizing function laud its ability to empower and connect, giving an unprecedented advantage to historically disenfranchised groups. However, skeptics such as David Karpf caution that there is a difference between real civic engagement through social media and merely slacktivism and clicktivism.

Malcolm Gladwell's commentary in *The New Yorker* was critical of social media doing little more than establishing weak ties, which may bring a million people to a Facebook page, but fail to mobilize 1,000 people to the streets and effect real change.

White House Social Media

President Obama has benefited from its engagement with the public via social media since his first election campaign and continued to use social media to communicate about his key policy endeavors, including health care reform. An analysis of social media platforms that Obama and Romney used in early June 2012 found that the Obama campaign posted nearly four times as much content as the Romney campaign, and was active on nearly twice as many platforms. The author of the study, the PEW Research Center's Project for Excellence in Journalism (PEJ), pointed out that both candidates utilized social media outlets such as Twitter, Facebook, and YouTube, not so much for the social function, also known as responding to voters or retweeting others, but mainly for direct digital messaging. The study concludes that, in 2012, voters were more actively involved in helping to shape campaign messages, whereas the traditional news media saw their authority lessen.

To promote ACA and to win re-election, the president's campaign used social media in several specific ways. First, the Obama re-election campaign Web site had visitors join 18 constituency groups, such as women and veterans, which allowed for direct messaging with targeted content to different constituencies. This targeted messaging strategy was not a feature in Romney's social media strategy. Second, the administration used social media messaging to debunk myths about ACA. The White House launched a Reality Check Web site to dispute popular criticisms of the new policies, such as tax dollars used to fund abortions. The well-designed site matches myths with facts, contains video testimony from patients and experts, and is media rich with features such as interactive maps. A few hours after the White House blasting the Web site packet to its hundreds of thousands of followers on Facebook and Twitter, users of the social news site Digg voted Reality Check to the site's homepage,

President Barack Obama at an “Open for Questions” online townhall event in March 2009. While the White House and the Obama administration have pioneered the use of social media such as YouTube and Web sites such as Reality Check to address major policy issues like health care reform, some critics suggest that the potential for truly interactive communication has not been fully realized.

indicating a tremendous success in reaching and mobilizing its base.

Open Government Initiative and Government 2.0

In 2009, and immediately after his inauguration, President Obama started an Open Government Initiative and subsequently released a memo to federal agencies with a call to engage in transparent, participatory, and collaborative governance. The memo specifically called for innovative tools and strategies to make government initiatives easily accessible for the public, to offer venues for citizens and government agencies, to become cocreators of ideas, and to facilitate public engagement. Social media outlets seemed to offer a solution because to achieve Government 2.0, Web 2.0 social technologies must be adopted. Government agencies and political figures started to embrace social media messaging. The White House, for instance, was among the first government agencies to use its YouTube channel for virtual townhall meetings.

Stuart Bretschneider and Ines Mergel saw this as a new wave of social networking technologies adopted by government and the public sector, and argued that when compared with the previous wave of e-government application, social media technologies offer one unique feature: They allow for real bidirectional exchanges, or real-time exchanges of content, while reaching more diverse and potentially more-engaged audiences. The feature of cocreation of content, Mergel argues, is “inherently collaborative and participatory and can help build online communities of interest around specific issues” and the above-mentioned Momsrising.com case illustrates this function and the community-building potential well. In a 2010 analysis, Rebecca Lapaze focused on social media messaging by four federal agencies, including the Department of Homeland Security and the White House; the author cautions that simply adopting a social media strategy does not automatically guarantee true civic engagement and participation that embodies Web 2.0 principles. A key Web 2.0 principle,

according to Mergel, concerns the directionality of information sharing and the extent to which citizens are able to “reuse, reshare, and discuss the content” provided and authorized by the government.

An early poll by Nationaljournal.com in 2009 with new media experts from across the political spectrum reported that the administration’s use of sites like WhiteHouse.gov warranted an average grade of C+. The main criticism was that the sites remained one-way forums with mostly top-down messaging, whereas the interactive features, such as the “Open for Questions” feature, were underutilized. In a 2009 memo, Peter Swire, former counsel to the Change.gov New Media Team, recognized the key limitations imposed within the federal government, which might explain the lower-than-expected performance of its Web 2.0 applications. The issues of scale were discussed, also known as engaging millions of motivated individuals using limited resources, and a complicated clearance process necessitated by the fact that a short Facebook post might be construed as official government policy.

Thomas Bryer offers an analysis of participatory venues, such as social media used in politics and governance, focusing on the alignment between government actions and citizen expectations. In this framework, the democratic equilibrium and the preferred position are the points where citizens have high access to participatory venues (mainly social media forums), and their expectations for civic engagement and government actions are well aligned. To achieve such a position, Web 2.0 principles such as directionality of information are essential for ensuring true transparency, participation, and collaboration. As can be seen throughout the health care reform saga, the role and potential of social media as forums of civic engagement and political discourse continues to be negotiated.

Homophily

Individuals are more likely to have a connection if they have common attributes. The homophily principle shows that relationships tend to be distributed according to the characteristics of the actors (whether persons, organizations, or other entities). People who share gender, ethnicity, language, class, values, or nationality tend to cluster in social networks. For instance, there is strong empirical evidence showing that girls tend to associate and become friends with other girls at primary school, whereas boys are more likely to be connected with other boys. This is one example of a homophile process.

Two different mechanisms seem to underlie homophile dynamics: selection and influence.

Social selection brings together individuals with common attributes. On the other hand, peer influence is the process by which the behavior of the individual is altered because of continuous interaction with significant others. Both processes, with different prominence, may be present in the same homophile dynamic. For instance, selection and influence contribute to the similarity of substance use patterns among friends. Following a social selection mechanism, adolescents who smoke tend to associate with more probability with smoking than nonsmoking friends. At the same time, social norms toward smoking in small friendship groups influence the behavior of individual members. Peer influence is an essential mechanism to initiate smoking behavior.

Homophily has also been documented in online social networks. One example is the network of consumption patterns of political books on Amazon. From 2004 onward, Valdis Krebs analyzed the “customers who bought this item also bought . . .” network for political books during American presidential elections. Results showed a dynamic of political polarization: Books with a Republican orientation were usually bought by the same customers, whereas Democratic literature was purchased by a different group of readers. Very few books played a “broker” role, acting as a bridge between Republican and Democrat arenas.

Facebook

Most evidence of homophily has focused on patterns of interaction on social networking Web sites. Facebook friends often conform to homophile clusters, where individuals share common characteristics. Students who share certain tastes in music and movies have a higher probability to establish a connection in Facebook, following a selection process. However, there is less evidence for peer influence processes in this case. Patterns of racial homophily were documented on Facebook friendship networks. However, co-residence and other forms of homophily below ethnic relationships seem to have a significant influence in the racial homophily effect. In fact, reciprocity and the tendency to be a friend of the friends of your friends (that is, transitivity) amplify the effects of racial homophily on Facebook networks.

Facebook users have an average of 120 friends. However, they actively communicate with only a

small subset of the list of contacts, usually with strong relationships (confidants, friends, and family relations) to which they typically share several common characteristics. Family and close friends usually constitute the core of personal networks on Facebook. Users maintain passive communication patterns with a long list of contacts. Educational institutions and the workplace are two relevant areas to establish Facebook's contacts.

Other Social Media

Homophile dynamics are present both in the access of users to different social networking Web sites (SNWs), as well as in the distribution of personal contacts between online networking platforms. SNWs differ in the social and demographic profile of their members. For instance, in Spain, adolescents tend to use Tuenti, a Spain-based SNW, whereas adults are more represented in Facebook. Meanwhile, Twitter has predominantly young users, inbetween Tuenti and Facebook. In the same vein, SNWs have dissimilar penetration in different countries: Orkut is widely used in Brazil, Hi5 is extensive in Mexico, and QQ in China. Similarly, SNWs attract people with similar interests, as when they are looking for professional networking on LinkedIn or dating on Meetic. Therefore, there is a selection process based on age, language, nationality, and professional profile contributing to homophile networks on SNWs. So, when an individual accesses the pool of contacts of a SNW, he or she is not connecting to a representative sample of the population, but to a self-selected network of people sharing demographics as well as social, economic, and personal characteristics.

Individuals distribute personal contacts in different online networking platforms. Some users choose one platform as the main reference, whereas others combine several SNWs simultaneously. Some users are very active, while others are passive. Individuals may separate personal and professional contacts, or try to congregate relationships in the same social space. As a consequence, homophile dynamics are first affecting the access to a particular networking Web site; and second, contributing to the formation of friendship clusters among people who share similar characteristics. From this point of view, merging two SNWs is more than just summing up two

pools of contacts, insofar as it can alter the structure of online personal networks.

Homophile processes are observed even when SNWs were designed without taking into account the distribution of personal relationships in different social circles. Facebook tends to congregate people who may originally come from different social circles in face-to-face interaction. However, even in this context of open interaction, homophile processes seem to predominate. During the last decade, SNWs have gained relevance as a context for political involvement and debate. For instance, according to the Pew Research Center's Internet and American Life Project, "39% of all American adults took part in some sort of political activity on a social networking site during the 2012 campaign." In this context, homophily on online networks may have important political consequences.

Homophile dynamics on online networks can contribute to political polarization. Studies of opinion formation processes have shown that greater interaction between like-minded individuals results in polarization. Similarly, the clusters of followers in Twitter are normally politically homogeneous, and as a consequence, users are unlikely to be exposed to cross-ideological content. Network dynamics seem to be relevant for political mobilization. A strongly connected voter network enables a politician to win an election, according to evidence from simulation studies. Also, political conversations with other members of the network predict political mobilization and community involvement. Within voluntary associations, homophily of political behavior is observed. The political orientations of individuals are reinforced through interaction with similar others, leading to behavioral involvement and political participation.

Honeycomb Framework

The honeycomb framework is a visual structure composed of several blocks in interdependence proposed by Jan Kietzmann, Kristopher Hermkens, Ian McCarthy, and Bruno Silvestre to help scholars and professionals understand how social media can be used as part of a communication strategy. This model emphasizes the functionality of Web social media, and may serve to understand the better way to include these instruments in a communication strategy showing comprehension with the ways that Web users use social media in their lives. The honeycomb framework presented by these scholars is based on the ideas of several bloggers, namely Stewart Butterfield, Peter Morville, and Gene Smith, who developed and combined ideas discussed by Matt Webb.

In nature, honeycomb cells in beehives are an example of geometric efficiency because the shape of the cells allows two opposing honeycomb layers to nest into each other, with each facet of the closed ends being shared by opposing cells. Applying this metaphor to Web social media and considering seven main attributes, Kietzmann, Hermkens, McCarthy, and Silvestre have defined functional blocks in interdependence. These blocks are:

- **Identity:** Related to the information provided to identify users, and that reveals themselves or a constructed self. This self-disclosure may include data about sex, age, occupation, or preferences on a real or deceptive basis (to assure anonymity).

- *Conversations*: Concerning the channels used to promote dialogue between users, that is, with means that allow talking in real or deferred time.
- *Sharing*: Linked to the exchange, distribution, and reception of meaningful content by participants. Sharing may lead users to start conversations and establish relationships, depending on the functionality of the social media platform.
- *Presence*: Related to ways of knowing who is available in the social media platform.
- *Relationships*: Concerned with the information provided about the bonds that individuals form with each other (e.g., family and friends), through which they feel connected and exchange meaning.
- *Reputation*: Related to the appreciation and trust of users to the social standing of participants and content, usually expressed in opinions.
- *Groups*: Linked to the possibility that digital channels have to provide the creation of communities of users with common interests.

These functional building blocks are neither mutually exclusive nor present in all social media activity because they are constructs that show how different levels of social media functionality can be configured. The authors' proposition is motivated by the need to comprehend how citizens are consuming the Web and how its use is maturing, evolving, and changing through time thanks to the new communication landscape and broadening exposure to it.

Presently, a multiplicity of social media that differs in terms of scope and functionality may be found: Some are more massive, while others are more focused on a target, function, or purpose. This diversity may lead to reluctance or the inability to use social media in a strategic communication campaign and promote an effective engagement between the political actor and users (citizens or constituents). The honeycomb framework allows a systematic view of social media and illustrates the more suitable platforms according to the objectives of a communication campaign. It is a tool that serves several purposes; for example,

it helps to define priorities, supports a modular approach to social media, and can serve as a looking glass, transforming how people see things and enabling new explorations.

The functionality of social media tools focuses on a combination of these blocks. For example, Facebook favors relationships, identity, and reputation, whereas channels of video sharing (like YouTube or Vimeo) promote sharing and group formation. Knowing the tools, their functionalities, reputations, and presence of the same users, organizations can define their communication strategies, which will depend on the market context.

HootSuite.com

HootSuite.com is the most known social media management program. It is an application that can be used for synchronizing all desired social

profiles. It provides advantages both for time management and to become organized. For example, if an individual wants to share something on all of their profiles, one can choose all desired profiles and share them all synchronously by using HootSuite, rather than logging into these profiles one by one. Another feature of HootSuite is that it allows creating scheduled content. tweets and profile posts can be scheduled and published at the desired dates and times. It decreases the time spent in social platforms and provides an opportunity to increase time efficiency. HootSuite is a tool providing proper solutions for corporate companies that attach importance mainly to digital marketing. With its goal of “primarily gathering the streams in social networks,” the target of HootSuite is defined as “dominating also the fields of customer services, CRM and publishing by taking the new functionalism to a step further.”

HootSuite is an external application through which one can manage multiple social network

accounts such as Google+, LinkedIn, Foursquare, Twitter, and WordPress. One must open a new account by registering. There are both free and paid versions. There are many limitations on free versions, but they provide good services for small companies and individual users. It allows only five different social media networks for free accounts, but allows unlimited social media network management for paid accounts. It supports many social media such as Twitter, Facebook, Foursquare, LinkedIn, Google+, Myspace, WordPress, Mixi, Tumblr, and YouTube. HootSuite may soon be a complete social center. Users will be able to share and display all content in social platforms such as Reddit, StumbleUpon, Scoop.it, CMP.LY, and Nexalogy through HootSuite. The total number of platforms supported by HootSuite is 35. Three new names, Evernote, Storify, and Zendesk, were added and supported by the Vancouver-centric HootSuite in August 2012.

HootSuite, founded in 2008, bought its competitor Seesmic, which performed a similar function for platforms since 2007, in September 2012. HootSuite was chosen the best social media tool of the year of 2010 at the Mashable Awards, which is one of the most prestigious awards of social media.

Twitter and HootSuite Cooperation

This method was implemented to increase Twitter ad revenues and to reach those who attract interest with promotion codes. Twitter wants to put this method, which Google frequently uses with AdWords, into practice, and joined forces with HootSuite, which is one of the most popular third-party tools. HootSuite, in this case, provides the most appropriate solutions for corporate companies that mainly employ digital marketing. Twitter began to give \$100 advertising coupons as gifts to convert these companies into advertisers after partnering with HootSuite. Twitter is the lead brand in social media. Their tools, used by companies monitoring consumer trends via social networks, have vital importance. The most used Twitter tool is HootSuite, with a usage rate of 29 percent, according to the research carried out by Pingdom. One of the most important features of HootSuite is its comprehensive social media measurement skills. Facebook and Twitter analysis and Google analytics are the most important

A sample screen showing HootSuite's mobile app for Android phones in early 2012. HootSuite is one of the leading tools used to manage social media accounts, especially Twitter.

social media measurements offered by the HootSuite. In addition, this tool offers draft reports and allows one to choose the most appropriate report among more than 40 modules. HootSuite is a Web-based application addressing users who want to use Twitter for business purposes.

One does not need to install HootSuite application on each computer separately when more than one computer is used in Web-based Twitter applications. HootSuite has some extra features, such as “send later.” User information can also be easily displayed by clicking on user names via the HootSuite application. This feature of HootSuite, which responds to the continuous updating demands of companies via Ping.fm, also applies to other social networks besides Twitter. The last advantage of HootSuite is that it uses a universal resource locator (URL) shortener. Users can use short URLs by means of Ow.ly or a third-party URL shortening service like Bit.ly.

HopeLab

HopeLab is a nonprofit organization founded by Pam Omidyar in 2001 to produce technology (e.g., games, applications, and social media)

to improve physical and mental health. Although HopeLab is located within the medical and pediatric health arena, it also represents an entirely new approach to “social technology,” a potent hybrid of social media and online gaming techniques that in 2013 was just beginning to pique the imagination of forward-thinking political strategists on the lookout for ways of making advocacy content even more ubiquitous in the everyday media mix. Sometimes called “gamification,” HopeLab’s innovative conceptual approach to information release and reconfiguring is, to some extent, mirrored in groundbreaking issues and advocacy sites like World Without Oil and Water.org, which are beginning to utilize similar techniques in the service of a social change agenda.

HopeLab created *Re-Mission*, a free online video game, to help young cancer patients kill video cancer cells and improve their health. HopeLab released *Re-Mission2* to provide more gaming options. HopeLab developed Zamzee, a portable tracker paired with a motivational, gaming, and tracking Web site to help youth become more physically active; activity earns users redeemable reward points. HopeLab’s Resilience Initiative, scheduled for development in 2014, aims to use mobile applications and social media to boost humans’ biological and psychological resilience. Studies have assessed the outcomes and impacts of HopeLab products. HopeLab is part of the philanthropic foundation the Omidyar Group, cofounded by Pam Omidyar and her husband Pierre Omidyar, who also founded eBay.

Pam Omidyar, born in 1967, earned a B.S. in biology from Tufts University in 1989, and attended the University of California, Santa Cruz, to study molecular genetics. In the late 1980s, Omidyar was a research assistant in an immunology lab who spent many hours viewing cancer cells under a microscope. Omidyar would unwind from her research by playing videogames with her husband Pierre, a software engineer who eventually founded eBay. The juxtaposition of these two activities gave Pam Omidyar the idea to develop a video game that would allow young cancer patients to kill cancer cells and ultimately improve their health. She founded HopeLab in 2001, where she developed *Re-Mission* in 2006.

Re-Mission has players drive a robot named Roxxi through simulated cancer patients’ bodies

while killing cancer cells and battling treatment side effects. HopeLab sponsored an international study of *Re-Mission* that reported improved health outcomes for young cancer patients and was published by *Pediatrics* in 2008. *Re-Mission* encourages and motivates healthy behavior (e.g., taking antibiotics consistently) that in turn enhances the effectiveness of medical treatment.

The study focused on the role of both behavioral and psychological factors (e.g., acquiring medical knowledge and increased sense of control over cancer) in successful cancer treatment. This study is said to be the largest randomized, controlled study of a video game intervention. It tracked the cancer treatment of 375 teens and young adults at 34 medical centers in the United States, Canada, and Australia over three months. *Re-Mission* was made available online for free, and was reportedly downloaded over 100,000 times by fall 2007.

In April 2013, HopeLab released *Re-Mission2* as a collection of six games focused on different aspects of cancer treatment (e.g., Leukemia and Stem Cell Defender), with possible game levels varying from 11 to 25. Nerdook Productions, Tinime Games, Borne Games, and Nova-leaf Game Studios developed these games. Game research and development was carried out with a group of 120 youths. The games are available for free online to clinics, hospitals, patients, their families, clinicians, and caregivers. This set of games incorporates data from research studies of *Re-Mission*, takes user data into account, and provides a variety of game-playing options. Like the original version of *Re-Mission*, the new game places players inside the simulated body of a cancer patient and has them apply real-life strategies and cancer treatments.

In 2010, HopeLab launched Zamzee, a pocket-sized activity meter that connects young users to a motivational game-based Web site. Zamzee was the subject of a study cosponsored by HopeLab and the Robert Wood Johnson Foundation, the results of which were announced at the 2012 Obesity Society Annual Meeting in San Antonio, Texas. Again using a randomized, controlled study, HopeLab evaluated the effects of Zamzee across a diverse sample of 448 middle-school students coming from urban, suburban, and rural locations across the United States. Half of the

study participants used the Zamzee activity meter without the Web site, and the other half used it with the Web site. The latter group reported a 59 percent increase in moderate to vigorous activity, saw reduced gains in bad cholesterol, and improved their blood sugar control. Users earn points for physical activity that they can redeem for rewards, including gift cards, charitable donations, and iPods. Zamzee is now marketed through a business that continues to work with HopeLab on the prosocial mission of the product.

HopeLab is currently planning a resilience initiative that will develop technology to bolster biological and psychological resilience to adversity using mobile technology and applications because of their pervasive presence in most people's lives. HopeLab has identified factors in human resilience through studying the scientific literature. Factors include a sense of healthy social connection, purpose in life, and control over one's destiny. HopeLab hopes to enhance each of these experiences in people's everyday lives with its technology, with a goal of having people live out their core values in everyday life.

Omidyar Group

HopeLab is part of the Omidyar Group, an extension of which is the Omidyar Network, where Pam Omidyar is a board member. She is also a board member of Tisch College of Citizenship and Public Service (Tufts University), and is director of the Ulupono Initiative. For her philanthropic and health initiatives, Pam Omidyar was deemed one of "The Top Givers" by *Business Week* in 2003–08, "The 25 Best Givers" by *Barron's* in 2009–10, and "The World's 7 Most Powerful Philanthropists" by *Forbes* in 2011. In 2011, she was awarded the Carnegie Medal of Philanthropy and an Honorary Doctor of Public Service (Tufts University). Omidyar resides in Hawai'i. HopeLab had released more than 200,000 copies of *Re-Mission* to over 80 countries by 2013, and has offices in Palo Alto and Redwood City, California.

Hoyer, Steny

Steny Hamilton Hoyer represents the Fifth Congressional District of Maryland in the U.S. House of Representatives. He has served in this office since 1981. Hoyer's district is located southeast of Washington, D.C., and includes mostly rural and suburban areas. A member of the Democratic Party, Hoyer was first elected in 1981. From 2003 to 2007 and again from 2011 through 2012, he served as House minority whip; from 2007 to 2011, he was the House majority leader. As of 2012, he was the second-highest-ranking member of the Democratic leadership of the House and had been since 2003.

Career

Steny Hoyer geared up for public office while serving as a staff member for U.S. Senator Daniel Brewster of Maryland from 1962 to 1966. During that time, he worked with fellow staffer Nancy Pelosi, who would later become speaker of the House, her position in 2012. In 1966, Hoyer won an office representing the 26th Senate District of Maryland in the state senate. Hoyer was then elected president of the State Senate of Maryland in 1975; this made him the youngest president in the history of the Maryland state senate.

In 1978, Hoyer made an unsuccessful bid for the nomination for lieutenant governor of Maryland. That year, he accepted an appointment to the Maryland Board of Higher Education; he held that post until 1981.

In 1981, the office of Gladys Spellman, congresswoman for Maryland's Fifth District, was declared vacant because of her ongoing illness. Hoyer won the primary election for this position by a small margin, and then went on to defeat his Republican opponent, Audrey Scott, although he was outfunded. This first election also won him the nickname "Boy Wonder." Since his second election in 1982, he has consistently been reelected to his position in the House, usually with a comfortable margin. Hoyer has served longer than any other southern Maryland House member.

Hoyer has a long history of service to the Democratic Party and the House of Representatives. He functioned as deputy majority whip in the House from 1987 to 1989. From 1989 to 1994, Hoyer served the Democratic Caucus as chair; this position is ranked fourth in the echelon of House of Representatives Democrats. Hoyer is also a member of the Democratic Steering Committee, and served as cochair in previous years. Between 1995 and 2000, Hoyer was the chief recruiter of candidates for Democrats in the House of Representatives.

Hoyer ran for minority whip in 2002, but Nancy Pelosi won that position. Next, Pelosi ran for minority leader after the midterm elections in 2002. At that point, Hoyer was elected as House majority whip, the second-highest-ranking Democratic position in the House. He served in that role from 2003 to 2007. Pelosi took on the role of speaker of the House in 2007, and Hoyer was elected to be House majority leader during the tenure of Democratic majority in the House from 2007 to 2011. He was the first Maryland representative in this position.

In 2010, the Democratic Party lost control of the House. Pelosi took the minority leader position, and Hoyer became minority whip once again. In 2012, he was still in that position.

Issues

In 2010, Hoyer took the position that middle-class tax cuts should only be temporary in that otherwise they would prove too costly. He identifies as pro-choice and, in 2003, he voted against the bill on partial birth abortion. Hoyer votes in favor of affirmative action and gay rights. He receives an "F" from the National Rifle Association based on his record of voting in favor of gun control.

The issue of immunity for telecommunications companies that engaged in warrantless wiretapping at the behest of George W. Bush after the 9/11 terrorist attacks has been a hot one for Hoyer. After being exposed in the press, the wiretapping program was sued by privacy rights advocacy group the Electronic Frontier Foundation. Nevertheless, Hoyer introduced a bill to extend wiretapping privileges and extend immunity for telecommunications companies that engaged in wiretapping, receiving criticism from many sides.

Hoyer was instrumental in the 1990 passage of the historic Americans with Disabilities Act (ADA), and later the 2008 ADA Amendments Act, which bolstered the existing law. He sponsored the Help America Vote Act of 2002, and in 2010, Hoyer played a role in ending the “Don’t Ask, Don’t Tell” policy.

Hoyer is a major fund-raiser for Democratic officials and candidates. During the 2006 and 2008 elections, he donated in excess of \$1 million to different Democratic candidates and to the party. This has been a source of controversy at times; in March 2007, the Center for Public Integrity reported that Hoyer raised the money he donated during the 2006 elections by “exploiting . . . a legal loophole.” However, as various commentators, including the Federal Election Commission, pointed out, Hoyer’s actions were legal, and his methods were transparent.

Social Media Use

Poleet reported in December 2012 that Hoyer had 25,000 followers and a Klout score of 82. OhMyGov reported in December 2012 that Hoyer had a Media Power Rank of 20th out of his 541 peers. It also showed that he had received more than 1,100 social media mentions in the past week, a typical result for him in 2012.

Although his social media presence is strong, in January 2011, Hoyer was the target of a social media attack in which his official Web site was linked to the wrong Twitter account. As a result, it appeared for a short time that he was tweeting comments including “Look how Republicans fell for this bi-partisan seating crap,” and “This is what happens when political offices pay for high-priced, money-sucking ‘social media’ firms that have no clue what they are doing.” The attack Twitter account was “@LeaderHoyer,” reportedly an old

account of Hoyer’s, rather than a phony or hacked account. His actual account was “@WhipHoyer,” and as of late 2012, that account remained active. It was speculated that, when Hoyer returned to the House minority whip position, he modified his Twitter account name to reflect the change. This left the older “@LeaderHoyer” account open, and this account was taken up by a different user in January 2011, days before the tweeting prank.

The prankster waited until the State of the Union address to tweet, and unfortunately, the congressman’s Web site still had a link to the old account when it happened. Within hours of the tweets, the link was down. Hoyer does use his actual Twitter account liberally, and had more than 20,000 followers in 2012.

June 2012, Hoyer continued to build up his presence in the social media world as he joined Google+, Instagram, and Pinterest, in addition to his existing Facebook, Twitter, and YouTube accounts. At the time he joined those three, he was reportedly the only member of the leadership of the House of Representatives who was on all of these networks.

Hoyer distinguished himself by joining Pinterest in because most male legislators, especially Democrats, have not begun to use Pinterest in any numbers, which reflect the site’s popularity. Pinterest, which is traditionally heavily dominated by female users, is relatively new ground for lawmakers. Given the number of female voters in 2012, it was probably a strategic move for Hoyer to join. Hoyer had nine pin boards of images on Pinterest in 2012, ranging from Hoyer History, covering his years in office, to In Maryland’s Fifth District, which Hoyer represents. Hoyer appears to be using Instagram in the style that is de rigueur for the site, sharing more casual behind-the-scenes photos, accompanied by background trivia.

In keeping with his voter rights positions, Hoyer created a video in October 2012, urging young people to register to vote and be heard in the November 2012 election. The video was part of an ongoing educational campaign from non-profit OurTime.org, designed to maximize voter turnout in the face of recent voter identification laws. Hoyer stated in the video that he feels many of these laws were enacted specifically to discourage voter turnout from certain groups. He urged

young people to vote, saying that they had the “biggest stake” in the election. The video remains on Hoyer’s YouTube channel and in other places on the Web. Hoyer’s channel had more than 400 subscribers in 2012.

In July of 2012, Hoyer announced the third annual Member Online All-Star Competition for Democrats in the House. Similar to the Republican New Media Challenge, the three-week competition is a friendly challenge designed to encourage online interactions with constituents. The winner each year gains the most new Facebook “likes,” Twitter followers, and YouTube subscribers during the three-week contest period. All House Democratic caucus members are automatically entered in the competition, and anyone except those in leadership positions can win.

Hoyer pointed out that, with more than 50 percent of American adults active on Facebook and more than 15 percent on Twitter, social media is crucial for lawmakers. Hoyer asked his constituents to follow him on his social media networks, if they did not already, and to share his profiles with their friends. He also announced a contest in which visitors to his Facebook site could enter their “high quality Maryland photos” for a chance to have theirs grace his page as the cover photo—making use of the format change to timeline to stay current with followers. Hoyer posted entries on his page and eventually chose a winner. In 2012, Hoyer’s Facebook page had more than 6,000 “likes.”

Huffington Post

The *Huffington Post* is a news Web site covering politics, business, entertainment, technology, style, media, and global news. It also has local versions in many major American cities, as well as international editions for Canada, France, and the United Kingdom, with Germany and Spain in development.

The site was founded in May 2005 by author, journalist, political analyst, and entrepreneur Arianna Huffington, former America Online (AOL) executive Kenneth Lerer, and Jonah Perretti, a graduate of the Media Lab at the Massachusetts Institute of Technology. It was initially intended to be a liberal voice on the Web in specific opposition to Matt Drudge’s *Drudge Report*, which is very conservative in nature.

The *Huffington Post* began its existence as a blog that aggregated content from other publishers across a wide variety of topics. It now employs a news staff to create original content in addition to featuring stories from external sources. It has several content-sharing partnerships that allow it to publish articles and posts from print and online

Arianna Huffington, cofounder of the Pulitzer Prize-winning *Huffington Post*, at the 2010 Webby Awards in New York City. *The Huffington Post*, which makes use of more than 1,000 unpaid bloggers, sold to AOL for \$315 million in February 2011.

ventures such as *TMZ.com*, *People*, *Rolling Stone*, and *Variety*. In addition to its news staff, it also boasts more than 1,000 unpaid bloggers who contribute to the site.

One of its competitive advantages is that, in addition to its multitude of unpaid bloggers, it also lists a number of celebrities across a variety of industries as contributors. Posts from prominent figures from television, medicine, film, education, politics, sports, and other A-list bloggers ensure steady traffic to the site, which generates traffic to the advertisers that pay to be seen alongside them.

The site is the first commercially run digital media initiative to win a Pulitzer Prize, which was awarded in 2011 to military correspondent David Wood, whose series “Beyond the Battlefield” chronicled the lives of wounded warriors, veterans who returned from Afghanistan and Iraq with

severe injuries. The Pulitzer Prize is considered to be journalism’s highest award.

It has recently enjoyed the position of the top political Web site in the United States by eBizMBA-Rank, which compiles its rankings based on traffic data provided by Quantcast and Compete. Statistics from November 2013 indicated that it enjoyed more than 19 million page views a day and had more than 89 million unique visitors that month.

Like the majority of news sites, there is no fee for use. The business model relies on advertising for its revenue stream. The site is known for its innovative strategies at driving readership. Through careful analytics, the site is able to constantly monitor which stories on its sites are performing well, and which are not, and modify positioning and placement on the home page accordingly.

The site is also particularly savvy in its use of social media. It was one of the first sites that allowed users to “like” and follow not only specific reporters and contributors, but also larger topics so that stories about that subject or from that author would automatically be pushed into individuals’ news feeds on their specified social media.

With the proliferation of blog sites like the *Huffington Post*, mainstream media is becoming more influenced by their content. Though traditional journalists still view sites like this with skepticism, the readership does not, and as a result, increasingly more mainstream publications use blog-heavy sites like the *Huffington Post* as source material for their work.

OffTheBus

OffTheBus is a spin-off of the *Huffington Post* with a unique twist. It allows citizen journalists to populate the site as watchdogs on candidates in the running for political office across the United States. Its title refers to the controversial novel *The Boys on the Bus* by Timothy Crouse, who posited that reporters who were assigned to cover political campaigns had difficulty remaining objective because of spending inordinate amounts of time so close to the candidates.

Merger With AOL

In February 2011, AOL, a global Web site company, announced its intention to purchase *Huffington Post* for \$315 million. As a result of this

purchase, the Huffington Post Media Group was created. The media group is the umbrella organization for existing AOL properties such as Moviefone, *Black Voices*, MapQuest, and *PopEater*, in addition to the *Huffington Post*.

Arianna Huffington

Arianna Huffington is the cofounder, president, and editor-in-chief of the *Huffington Post*. Born in Greece, Huffington was educated in the UK and spent her young adulthood there, where she became an author for the first time with her book *The Female Woman*, which decried women's liberation. She has 11 books to her credit.

She came to the United States in the 1980s and became more prominent when her husband Michael unsuccessfully ran for the Senate in California in 1994. She developed a reputation as a conservative and partnered with former *Saturday Night Live* player and noted liberal Al Franken as a counterpart in "Strange Bedfellows" for Comedy Central's 1996 coverage of the U.S. presidential election.

She experienced further notoriety during the Clinton administration through her creation of Resignation.com, a Web site that focused on the call for the president to step down during Clinton's impeachment crisis. Over the years, her political leanings have shifted from conservative to more of a liberal perspective. She has dabbled in acting, appearing on a number of television programs, and even a few movies. She was named among the "Most Influential Women in the Media" by *Forbes* magazine in 2009.

Human Rights

Human rights and politics have been inextricably intertwined throughout history, tracing back to the religious, philosophical, and historical origins of the modern concept of human rights. Human rights are both justifiable moral claims and contested political realities. Examples of modern social and political movements advocating human rights include abolitionist movements; women's suffrage; civil rights; antiwar movements; worker and labor rights; immigration rights; lesbian, gay, bisexual, and transgender (LGBT) rights, and more. Many organizations and individuals have worked to create social change in the wake of repressive government rule or social, cultural, and political inequality.

The advancement of technology and the Internet have facilitated the dissemination of human rights activism globally. The advent of social media, or Web- and mobile-based applications that facilitate the exchange of information and interactive dialogue, have allowed for information to be published and accessed by anyone, and circulated to a broader audience. Examining the concept of human rights and its link to politics through historical movements and social networks provides a basis for the understanding of modern-day human rights movements and the implications of social media for human rights activism today, as well as the threats that social media can pose to the exercise of human rights.

Origins

Human rights are the rights one has by virtue of being a human being. Such rights are thought to be inalienable, unable to be taken or given away, and universal, equally claimed for all. Historical concepts linked to human rights, such as progressive punishment and justice, can be traced back to the Code of Hammurabi in ancient Babylon; Hindu and Buddhist essential freedoms and virtues; Confucianism's emphasis on education, self-actualization, and commitment to a social unit or community; and natural law extending beyond rights of citizenship and the individual's capacity to reason in ancient Greece and Rome.

Based on the views of Plato and Aristotle, Cicero advanced the idea of stoicism and reason possessed by all. Religion also played a large part in advancing ideas of moral equality for all human beings in the teachings of Christianity, solidarity and justice in Islam, and laws protecting rights and outlining duties in Judaism. Medieval Christian philosophers such as St. Thomas Aquinas promoted the idea of natural law as connected to the law of God, with reason bestowed to all human beings to allow individuals to act in accordance with universal values.

Philosophers and political theorists such as Hugo Grotius, John Locke, Thomas Hobbes, and Jean-Jacques Rousseau contributed to the idea that natural law can be conceptualized independently from God. Historical developments such as the Reformation and the English, French, and American revolutions contributed to the secularization of the universal ethics of rights. The Enlightenment ushered in a new discourse of rights relating to individual reason and freedom of choice, with the emerging nation-state to advance such ideals of human rights.

Human Rights and Politics

Human rights are exercised when their enjoyment is questioned, threatened, or denied. Human rights are linked to natural and legal rights, both nationally and internationally. Human rights seek to fuse moral vision and political practice by establishing limits and requirements of social and state action.

The Magna Carta of 1215 was the first instance in England of a group of subjects limiting the powers of a king by law. In 1648, the Peace of

Westphalia established a new system of political order in Europe, emphasizing sovereignty of states and self-determination. The concept of a social contract by which individuals gained rights in society by subjecting oneself to civil governance emerged through the views of Thomas Hobbes in the 17th century, and was further expanded upon by John Locke in his belief that the purpose of law was to preserve freedoms and rights of individuals. Early political expressions of this concept of human rights can be found in the American Declaration of Independence, the French Declaration of the Rights of Man and of the Citizen, and the English Bill of Rights. Emerging from the English, French, and American revolutions, these documents codified ideas of human rights in political discourse, tying the language of rights to political revolution and transition.

The establishment of the International Committee of the Red Cross, as well as the adoption of the Geneva and Hague conventions, subsequently laid the foundations of international humanitarian law. After World War I, the League of Nations was established during negotiations over the Treaty of Versailles in order to promote collective security, peace, global welfare, and to settle disputes through diplomacy and negotiation. After World War II, the Allied powers agreed to replace the League of Nations with the United Nations (UN), providing a basis for the protection of human rights in the UN Charter.

Human rights were further codified in the Universal Declaration of Human Rights, the International Covenant on Civil and Political Rights, and the International Covenant on Economic, Social, and Cultural Rights. The Universal Declaration of Human Rights, passed by the UN General Assembly in 1948, was the first international legal effort to limit the behavior of states through obligations and duties to their citizens, outlining basic rights to which all human beings are entitled. The social and political movements leading up to and following World War II laid the groundwork for modern human rights discourse and activism.

Historical Activism and Social Networks

Political movements are organized around a set of issues or shared concerns of a social group. Movements can be local, regional, national, or

global in scope. Some aim to influence government policy, while others have aimed to establish or broaden the rights of subordinate or subaltern groups. Some have represented class interests, while others have expressed national aspirations. Political movements can also involve struggles to decentralize or centralize state control.

Human rights campaigns have been launched throughout history in efforts to advance various social and political movements, including national liberation movements, the abolition of slavery through the Underground Railroad network, the civil rights movement, the women's suffrage movement, and LGBT rights movement, among many others. Activists formed political parties, community organizations, and social groups to advocate their causes through word of mouth, public speeches, protests, and printed materials. Efforts of movements advocating human rights resulted in various amendments to the U.S. Constitution, including the Thirteenth Amendment banning slavery, the Fourteenth Amendment on citizenship and civil rights, the Fifteenth Amendment guaranteeing African Americans the right to vote, and the Nineteenth Amendment granting women the right to vote.

During World War II, underground social networks and resistance groups such as the Polish Home Army, organized against the Nazi occupation. Organizations and networks in France provided intelligence to the Allies and helped escaping Allied servicemen. Many worked to hide families or provide temporary refuge from persecution. Similarly, local populations in Denmark organized to help people from Jewish communities escape to Sweden.

Mohandas Gandhi applied the practice of non-violent civil disobedience to grassroots organizing of human rights movements. Gandhi protested racist policies in South Africa of British colonial powers against the Indian minority population, using economic boycotts to effect political change. Nelson Mandela later evolved as a leader in the fight against racism and apartheid in South Africa, becoming the first president of a democratic South Africa after he was imprisoned for 27 years for his advocacy efforts. Similarly, in the United States, the modern civil rights movement stemmed from the doctrine of separate but equal used to segregate blacks and whites. In 1954, the

U.S. Supreme Court ruled the doctrine unconstitutional with respect to separate educational facilities for black and white students in its landmark judgment for the case of *Brown v. Board of Education*. Rosa Parks and Dr. Martin Luther King, Jr., became known as leaders of the civil rights movement in the United States through their protests, boycotts, and practice of civil disobedience. Sit-ins, marches, demonstrations, and boycotts continued throughout the United States, and were propelled by activists across the country advocating for equal rights.

Other movements that utilized human rights networks to advance their causes include the women's rights, LGBT rights, and immigrant rights movements. The women's rights movement grew out of advocacy for the right to vote, followed by the Equal Rights Amendment of 1923. The 1964 Civil Rights Act served as a vehicle for addressing gender inequality and the formation of the National Organization for Women (NOW). This grew into a global campaign for women's rights, including reproductive health. Similarly, LGBT groups have advocated for equal rights under the law. Campaigns for same-sex marriage, reports on human rights violations against LGBT communities, and advocacy efforts for basic rights to housing, contracts, employment, and child custody have become central to many LGBT activist groups. Social movements and networks have also helped push for immigrant rights, and have aided in promoting advocacy for documentation, employment, housing, health care, and legal services for immigrant populations.

Technology and the Internet

Many human rights organizations have begun to build a presence on the Internet to promote their activities and campaigns and to increase advocacy by mobilizing networks of local volunteers. Local chapters of international organizations use their Web sites to provide information and organize advocacy efforts. Radio Free Europe/Radio Liberty uses the radio and Internet to broadcast news to countries where free press is not endorsed by the government. Using social media tools such as YouTube, Twitter, and Facebook, within minutes of an event, anyone with access to the Internet can view messages and videos. Organizations such as Amnesty International and Human Rights

Watch have utilized these methods, in addition to their Web sites, to promote fact finding, impartial reporting of human rights abuses, and targeted advocacy efforts. Technology, such as camera phones and mobile Web browsing, in addition to social media platforms on the Internet, have made it easy to reach a large international audience in a matter of minutes to promote human rights activism and advocacy.

Promoting Human Rights Via Social Media

Social media can refer to a range of Internet-based applications that allow for the exchange of user-generated content through interactive participation by users. Types of social media can include collaborative projects, virtual worlds, blogs, content communities, and social networking. Wikipedia provides the most prevalent example of collaborative projects, or people working together to assemble content. Online collaboration projects can allow people to share documents, such as political strategies, through platforms such as Google Docs used in the Egyptian revolution in 2011. Blogs allow for the creation of online content on topic of the author's choice, enabling commenting by individuals. Video blogs, or "vlogs," allow for streaming video content to be accessed by the Internet community. This allows for an accessible alternative to mainstream media. Content community Web sites such as Flickr, YouTube, and Instagram allow for sharing of content such as photos and videos, which can be invaluable in exposing human rights abuses to the international community.

Social networking sites such as Facebook and Twitter enable users to share information by creating profile pages with virtual friends. Attracting only a fraction of the users on Facebook, Twitter is becoming an influential source of real-time news. Allowing members to post brief messages, or tweets, Twitter has created a mobile information network that allows communications to be posted and made available to the public instantaneously. Such social media sites provide free and widely accessible information across socioeconomic groups. Mobile phones with Internet, video, and photographic capabilities have also become crucial to the documentation of human rights abuses. Coupled with social media outlets, mobile phones can be used to record and

disseminate information advocating a human rights initiative within minutes.

Social media is an important new tool for promoting social and political change. Social media allows eyewitness accounts to be made widely available and expands access to information. Reporting is no longer confined to traditional sources of journalism. Through social media, information has spread faster and farther, available now to local, regional, and global audiences. In the context of human rights movements, this element of spreading messages and bringing attention to a cause is crucial. Such attention to local activists also means that a human rights defender's disappearance is more likely to be noticed and reported. Furthermore, social media allows access to evidence of human rights abuses beyond the limitations of mainstream media sources and boundaries of nongovernmental organizations. The availability of mobile media, including camera phones, allows such information to be documented and disseminated almost instantaneously. Access to this type of information through social media also facilitates conversation and debate through which political opinions are formed.

Mobile communications have continued to be utilized to promote political activism and social protest throughout the world. Social media and networking sites played a major role in student human rights protests in Moldova in 2009 and in Iran the same year, following presidential elections. The term *Twitter Revolution* has been used to describe the protests in Moldova and Iran, as well as the Tunisian and Egyptian uprisings in 2011.

The effect of protests and movements advocating for human rights fueled by social media have had a profound impact on the political sphere. Examples of recent efforts to galvanize the masses to political activism through social media include the Save Darfur campaign, WikiLeaks, the Arab Spring, Occupy Wall Street, and "Kony 2012."

Save Darfur

The Save Darfur Coalition is a U.S.-based advocacy group that was organized in 2004 in response to the atrocities in the Darfur region of Sudan. The coalition is comprised of more than 180 organizations that have campaigned for a response to human rights violations that have occurred in the

Marchers filling the streets and impeding traffic during a street protest in Tehran, Iran, four days after the contested presidential election results of June 12, 2009. The protests, which continued into early 2010, became known as the Iranian Green Movement, which sought to improve human rights and encourage political change. Activists around the world marched in support of the Iranian protesters.

western region of Sudan. According to its Web site, Save Darfur inspires action, raises awareness, speaks the truth on behalf of the people of Darfur, and works with world leaders to demand an end to the genocide. By compelling everyday citizens to join the movement, the Save Darfur Coalition has worked to build a political movement, organizing more than 350 rallies in 41 countries. The coalition houses a network of more than 1 million online activists.

The Save Darfur movement has received criticism for presenting a one-sided picture of an ongoing civil war as a campaign of genocide by the Sudanese government-supported Janjaweed militia against defenseless civilians, without contextualizing the violence or presenting details on the complexity of the conflict and ongoing civil war. The movement has been accused of distorting the conflict by presenting a dichotomy

between Arabs versus blacks, when the population in Darfur is predominantly African Muslim. The movement has also been criticized for the use of its funds and allocation of financial resources used for lobbying the U.S. government to intervene, rather than to help the people in Darfur, advocating for military aggression, rather than for a political settlement.

Additionally, the composition of the Save Darfur movement has been characterized as well-connected and well-funded U.S. foreign policy elite and celebrity supporters. Others have accused the movement of being a U.S. government-supported propaganda campaign to target the Sudanese government with anti-Arab prejudice. Save Darfur's advocacy efforts, while raising awareness through social media such as Facebook, YouTube, and Twitter, have also caused problems in Darfur, with coalition members focused primarily on lobbying

as opposed to providing humanitarian aid, even after violence in the region declined.

WikiLeaks

WikiLeaks emerged in 2006 as a Web site publishing secret information, news leaks, and classified media from a database of more than 1.2 million documents from anonymous sources from within governments, corporations, and organizations. Among its notable developments, WikiLeaks has published video footage of the Baghdad airstrike in 2007, in which Iraqi journalists were killed by an Apache helicopter ("Collateral Murder" video), the Afghan War Diary of documents not previously available to the public, the Iraq War Logs mapping deaths in insurgent attacks not previously reported or published, and secret files relating to prisoners in Guantanamo Bay. In 2010 and 2011, in collaboration with news media in the United States and Europe, WikiLeaks released large amounts of classified information allegedly leaked by a soldier in the U.S. Army, including military documents from Afghanistan and Iraq, as well as thousands of State Department cables. Detractors claim that WikiLeaks represents a serious threat to national security and both collective and individual privacy. WikiLeaks supporters maintain that, intended as a Web site to bring news and information to the public through original source material, the WikiLeaks model has posed a significant challenge to the privacy and confidentiality of government and corporate information.

Arab Spring

The Arab Spring is a wave of revolutionary demonstrations and protests in the Arab world that began in December 2010 due to mass dissatisfaction with corruption and oppression by governments. The first uprisings occurred in Tunisia in the town of Sidi Bou Zid in December 2010. Street vendor Mohamed Bouazizi set himself on fire in protest of harassment and humiliation by municipal officials, which resulted in massive protests and uprisings against state repression and corruption, and eventually, the ousting of President Zine al-Abidine Ben Ali.

Videos of protests were uploaded to Facebook, one of the only video-sharing sites in Tunisia that was not censored. Because print and broadcast media were controlled within Tunisia, social media

provided an outlet for citizen journalism to spread the word of the uprisings. Facebook groups were created to promote advocacy for social change, and Twitter users began to spread messages of solidarity with protesters. Youth movements in Egypt took notice of the events in Tunisia, and began calling people to attend rallies and protests in Tahrir Square in January 2011. This momentum resulted in 17 days of massive demonstrations that ultimately forced the resignation of President Hosni Mubarak on February 11, 2011.

Other countries that subsequently experienced political change and civil uprisings include Libya, Yemen, Bahrain, Syria, Algeria, Iraq, Jordan, Kuwait, Morocco, Sudan, and others. In September 2012, social protests in the Palestinian Authority demanded and resulted in the resignation of Prime Minister Fayyad. Techniques of civil resistance have been implemented in these ongoing campaigns of demonstrations, protests, marches, and rallies by utilizing social media to organize and advocate for social change. Many uprisings have met violent resistance from progovernment forces and counterdemonstrators. Mainstream media such as Al Jazeera integrated traditional services of news coverage with social media to use citizen journalists on the ground to inform syndicated stories. This was important in spreading news of protests and uprisings in Tunisia regionally and globally.

Occupy Wall Street

In the United States, similar protest movements began in September 2011, in response to social and economic inequality, corruption, and the perceived influence of corporations on the government. The movement was called Occupy Wall Street, and began on September 17, 2011, in Zuccotti Park, located in New York City's Wall Street financial district. The slogan "We Are the 99 Percent" refers to the growing income inequality and wealth distribution between the wealthiest 1 percent and the rest of the population.

Protesters were forced to vacate Zuccotti Park on November 15, 2011, turning their focus to protesting at banks, corporations, and university campuses. Like the Arab Spring protests, Occupy Wall Street relied on social media and the Internet in order to spread its message and galvanize people to fight for their social and economic rights.

Kony 2012

Kony 2012 is a short Internet video released on March 5, 2012, that was created by the organization Invisible Children. The film was made in order to promote the organization's Stop Kony movement to raise awareness and advocacy to bring Ugandan war criminal and Lord's Resistance Army (LRA) leader Joseph Kony to justice.

The organization has promoted its campaign through posters, T-shirts, buttons, stickers, and bracelets. Invisible Children has focused on obtaining support for its campaign from high-profile individuals and celebrities, including George Clooney, Angelina Jolie, Oprah Winfrey, Taylor Swift, Ryan Seacrest, Rihanna, Nicki Minaj, Kim Kardashian, Bill Gates, former President George W. Bush, Condoleezza Rice, and John Kerry, among others. By September 2012, the film had more than 92 million views on YouTube and 16 million views on Vimeo. On April 5, 2012, Invisible Children released a follow-up video titled *Kony 2012: Part II—Beyond Famous*.

The film has been criticized for its manipulation and oversimplification of facts regarding LRA violence for strategic purposes by its black-and-white portrayal of Kony. Critics refer to this type of activism as "slacktivism." Portraying Kony as a global celebrity embodying evil, as opposed to an actor in a complex regional conflict, has contributed to misinformation and a misleading impression regarding the location and activities of Kony's LRA forces. This becomes problematic not only in its impact on global activism, but also in its impact on regional and international politics because the video calls for military intervention.

Fact-Finding and Documentation

The collection, creation, and dissemination of documentation and reports of violence are central to human rights advocacy. Although this technique has been used for decades, the recent surge in communication technologies and social media has facilitated the dissemination of digital materials by advocacy groups. Electronic evidence can be created or stored digitally on computers, cell phones, and cameras, and may involve first-person recordings of events or testimony, news articles, videos, or forensic evidence. According to the Center for Research Libraries, this may include digital images, audio, or video; networked communications such

as e-mail or text messages; information from Web pages, blogs, Twitter posts or other social media; text files, word processing documents, or spreadsheets; database records; records of transactions; court records and testimonies; and scanned images, digitized audio or video, and so on. Efforts by organizations such as WITNESS show ways in which human rights activists can use digital technology for evidence collection and crisis response, as well as human rights advocacy campaigns. HURIDOC's OpenEvsys project provides human rights organizations with software to document and manage data on human rights violations. Such efforts for documentation can contribute to creating historical records; pursuing accountability for human rights violations; advocating for transitional justice, such as truth commissions, prosecutions, reparations, and so on; and affecting policy change at local, national, and international levels.

Criticisms of Social Media

Skeptics have argued that true social change can only occur through meaningful, on-the-ground activism characterized by strong group identity and cohesion. Critics such as Malcolm Gladwell argue that social media promotes slacktivism, or feel-good measures in support of a cause with little to no practical effect, aside from personal satisfaction. Social media present a low-cost, minimal effort option that many have begun to substitute for substantive action. Such efforts include signing online petitions, joining Facebook groups, liking a cause on Facebook, posting or retweeting copied statuses or messages, sharing YouTube videos, or updating one's profile to reflect support of causes. Also known as clicktivism, the phenomenon of clicking a button to indicate support is argued to reduce social action to what is essentially no more than a list of names, as opposed to engaged activists. Gladwell argues that successful activism requires hierarchies and allocation of tasks with centralized leadership, and that social media makes it easier for activists to express their views, but harder for such expression to have any real impact.

Propaganda and Hate Speech

In addition to contributing to positive social change through human rights documentation and advocacy, social and traditional media can also be used to communicate inaccurate information,

leading to negative change. Media have been used to escalate violent conflict through hate speech, dating back to cases of Nazi propaganda campaigns through print and radio media.

In 1994, popular radio stations in Rwanda were used to broadcast messages inciting people to exterminate the Tutsi population. The most popular station, Radio Television des Milles Collines (RTLM), preached messages of Hutu supremacy to its listeners. Within minutes of the shooting down of Rwandan President Habyarimana's plane, RTLM accused Belgian peacekeeping troops in Rwanda of shooting down the plane, resulting in the brutal deaths of Belgian soldiers and the withdrawal of UN forces. RTLM then gave the signal to begin the massacre of Tutsis and moderate Hutus. In addition to its role in promoting activism and social change, social media were also used in the Arab Spring in 2011 to incite violence. The debate over media censorship to curb ethnic tensions and hate media has been ongoing in Bosnia as well. Organizations such as al-Qaeda also utilize social media and the Internet to spread their ideologies.

Censorship and Freedom of Expression

The role of social media sites in promoting human rights advocacy, as well as propaganda, has resulted in censorship by several governments. After the presidential election riots in 2009 in Iran, the government blocked many Web sites and increased surveillance of Internet users. Similar issues exist in China. Internet companies that operate in China are bound by the government's strict censorship policies. The organization Reporters Without Borders highlights that, according to its Press Freedom Index for 2011 and 2012, repressive media censorship and regulations are most prevalent in Eritrea, North Korea, and Turkmenistan, followed by Syria, Iran, and China.

The Internet has served as a key factor in promoting civic participation in political processes. The Egyptian revolution, beginning online through social media sites such as Facebook and Twitter, faced government Internet blackouts aimed at silencing the masses of online activists. People used short messaging service (SMS) text messages through mobile phone networks and dial-up Internet connections to post updates to Twitter, which were then picked up by international media such as the *New York Times*, the

Guardian, Al Jazeera, and CNN. Governments in Tunisia, Bahrain, Libya, Syria, and Yemen also began to shut down social media platforms that were used for mobilization for protests during the Arab Spring uprisings.

It is difficult, however, for states to shut down popular Web sites where most people engage in trivial activities unrelated to social activism. According to the cute cat theory of digital activism, shutting down popular social media sites can aggravate those who were previously apathetic, causing people to become politicized. Although social media facilitates interaction among users, content is mediated by private, intermediary companies. Content can therefore be censored both by local governments and social media companies.

Although one might be able to challenge state censorship in a court of law, there are few remedies if a private social media company chooses to take down someone's page. The concept of net neutrality suggests that the Internet should be free of censorship by governments or service providers. Such ideas harken back to the principles outlined in the Universal Declaration of Human Rights to include the right to free speech, free association, and the right to privacy.

The Right to Privacy

The right to privacy has become a concern with respect to various social media sites. Such sites collect personal user information that can be utilized in personalized Internet searches. Facebook has been criticized for altering its interface and platform in ways that undermine user privacy. Although users can change their privacy settings, oftentimes they do not realize that such settings have been affected because of the new platform, and can consequently be sharing more information than intended. Such social media sites essentially constitute searchable databases of volunteered personal information. There is also the danger of access to such private information by governments or law enforcement agencies. In 2011, for example, the United States subpoenaed Twitter for information on users associated with WikiLeaks. This battle for the right to privacy is one indication of ways in which social media can infringe upon human rights while promoting advocacy for rights in other ways.

Conclusion

The relationship between human rights, politics, and social media has served as the nexus for analysis of many modern social movements. Dating back to philosophical and historical origins in religious and secular texts, human rights can be applied to both political realities on the ground and moral claims to such rights. Modern human rights movements have advocated for social change through technology and social media. These tools have made it easier for information to be spread worldwide at the click of a button, allowing for messages of advocacy to reach a wide audience with ease. It is important, however, to also acknowledge the potential for the spread of propaganda through such instruments. In addition to tracking and profiling dissidents, the Internet can be used to promote the views of those dissidents. Therefore, one must also take caution when promoting social media as an instrument of progressive political change. As easy as it is for positive messages to be circulated to a global audience, it is equally possible for false or negative campaigns to be spread through the Web.

The fact that most popular social media tools are run by large, for-profit corporations also presents a threat to freedom of speech and censorship based on the agendas of such companies and their relationships to potentially repressive government bodies. Social media today has created unprecedented access to information, voices, and connections globally, allowing for the dissemination of human rights and activism, which has shaped the future of modern human rights campaigning and advocacy throughout the world.

I

I Am Gonna Be Your Friend Campaign

“I Am Gonna Be Your Friend” is a line taken from the 1973 song “High Tide or Low Tide” by Bob Marley and the Wailers to name a Save the Children–affiliated campaign to fight starvation in east Africa. The campaign’s name evokes the convention of friending people on social media. The campaign urges celebrities’ social media followers (friends) to disseminate director Kevin McDonald’s film about child starvation in east Africa set to Marley’s song. Donations are then made directly to the campaign (www.imgonna-beyourfriend.org) and by purchasing the charity single version of “High Tide or Low Tide.”

Kevin McDonald is a filmmaker and documentarian, best known for his Oscar-recognized documentary *One Day in September* (1999) and feature film *The Last King of Scotland* (2006). In 2011, while working on the documentary, *Marley* (2012), about reggae artist Bob Marley, McDonald uncovered the connection that Marley felt for Africa and African people. As a result, McDonald created a short video about the devastating drought and famine affecting east Africa set to Bob Marley’s song “High Tide or Low Tide.” The three-minute video focuses on children suffering from severe malnourishment and dehydration.

In 2011, the drought and famine were widely reported to be the worst to strike east Africa in decades. Reuters estimates the total number of people affected at 12 million in the Horn of Africa, which includes Somalia, Ethiopia, and Kenya. The problem was important enough for the United Nations Food Agency to call for high-level talks to tackle the crisis and discuss rebuilding agriculture in the area. In 2011, Save the Children projected that 1 million Somali children would die without aid.

McDonald’s video ends with a black-and-white photograph of Marley, over which an appeal to help east Africa’s children and a Web link for the I’m Gonna Be Your Friend campaign donation page are superimposed. The campaign is affiliated with the global charity Save the Children, which delivers food, water, and medicine to children in need. The campaign has celebrities use their social media networks (for example, Facebook or Twitter) to disseminate information about the campaign and urge their followers to purchase Marley’s rereleased-for-charity single or to directly donate to the campaign through their donation page or that of Save the Children.

Celebrities, artists, athletes, entertainers, and singers used their social media networks to disseminate the video, news of the plight of east Africa, and fundraising appeals to their fans. Participating individuals included Eminem, Lady

Gaga, Jay Z, David Beckham, Bono, Beyoncé, Muhammad Ali, Jennifer Lopez, Elton John, Lewis Hamilton, Bruno Mars, Robert Plant, Kanye West, Madonna, Cristiano Ronaldo, Justin Bieber, Brian May, and Sting. It is estimated that a total of 150 stars communicated the campaign to an estimated 700,000 million online followers. The campaign announced a goal of reaching a billion people globally with the message. Google featured the campaign and links to its video on its homepage on August 18, 2011. At the time, Save the Children applauded the move, noting that over a billion Google searches are made each day.

Several celebrities visited affected areas to draw attention to the campaign. Somali-born model, actress, and entrepreneur Iman visited Somalia's capital of Mogadishu in 2011 under the auspices of Save the Children, and she described the devastation and human suffering that she witnessed. In the same year, Somali-Canadian singer K'Naan, whose hit "Waving Flag" was the 2010 World Cup anthem, used his international celebrity to bring attention to the food crisis when he visited Somalia. Also, U.S. rapper, actor, and entrepreneur 50 Cent visited Doolow district in the Gedo region of Somalia in 2012, where he met with men, women, and children living in displaced persons' camps for civilian victims of civil strife. The experience led the artist to tweet that he wanted to feed a billion people in Africa five years from the time of his visit.

Rita Marley, the widow of Bob Marley, lent her name to the campaign on behalf of her husband, who died in 1981 from cancer. Bob Marley's daughter, fashion designer Cedella Marley, has also used her celebrity to promote her family's 1 Love Charity program that, in addition to the I Am Gonna Be Your Friend campaign, has included third-world water relief, and earthquake relief in Japan. As a result of the campaign, Bob Marley's Facebook following grew from 18 million to more than 30 million people.

I Am Second Movement

The I Am Second online ministry movement was conceived from the Bible verse John 12:32: "Lift up Christ so that He might draw the people of His city to Jesus." Essentially Web-based, I Am Second aspires to provoke change by providing narratives about finding a sense of purpose in Jesus, putting the individual second. Norm Miller, chair of Dallas-based Interstate Batteries, believed that there was a need for an organization that would put these words into action. He took the idea to e3 Partners, an evangelical 501(c)(3) organization that he had partnered with in prior ministry endeavors. On December 2, 2008, they launched a billboard campaign in the Dallas area featuring the photo of an athlete, entertainer, leader, or "regular" person with the phrase "I Am Second" and the group's Web site on a stark, black background. The campaign now extends through print advertisements, television, films, events, speakers, and social networking sites, as well as small support group meetings.

E3 Partners manages Web content production and distribution. In 2009, the I Am Second Web site was selected as a finalist in the Activist and People's Choice categories of the South by Southwest Web Awards. The Web content centers on video testimonials from Seconds recounting their struggles, showing how these were overcome when the Second put him- or herself second to Jesus. Subjects range from death, divorce, and drug and alcohol abuse to satisfaction and finding

a purpose in life. The belief is that testimonies of those changed by God are strong arguments for faith. By December 2012, the 83 videos, which run from five to eight minutes, were plainly produced, featuring a person dressed in a black t-shirt, sitting in a white chair lit by an overhead fixture. One of the original and most famous testimonials is from former Korn band member Brian Welch, who relates how his crystal meth habit was overcome by establishing a relationship with Christ. In another, author Anne Rice (*The Vampire Chronicles*) describes herself as a “Christ-haunted atheist” whose early writings were reflections of her struggle with faith.

Other celebrity Seconds include American Idol Season 10 winner Scotty McCreery, who wore the black I Am Second wristband in his appearances; Olympian and cancer survivor Scott Hamilton; Bethany Hamilton, champion surfer; fashion blogger Lauren Scruggs, who nearly lost her life in 2011 when she walked into a spinning plane propeller; actor Steven Baldwin; former football coaches Tony Dungy and Joe Gibbs; National Football League quarterbacks Sam Bradford and Colt McCoy; and National Association for Stock Car Auto Racing (NASCAR) champion Trevor Bayne. Its Web site describes the narratives as ones “that give hope to the lonely and the hurting, help from destructive lifestyles, and inspiration to the unfulfilled.”

The Web site is not limited to Seconds video testimonials as it also offers a large number of resources to spread its ideas. Devoid of denominational influence, the resources offered may be used in church services, workplaces, or community groups. I Am Second provides extensive information, training, and free resources, as well as opportunities to engage in I Am Second lead labs. Based on a discuss-and-discover model, these lead labs offer leadership training that fuses scripture with individual commitment and discipleship. Participants experience developing discussion groups that are Bible-centered, yet individually focused. Leaders discover how to act as disciples, sharing with others what they’ve experienced and helping members toward individual commitments. These leaders return to their communities to create I Am Second support groups, which are unlike traditional Bible studies, by encouraging people to contribute through questions and scriptural discussion. I Am

Second groups may be found in cities worldwide. In 2012, the Web site debuted the I Am Second church campaign kit, which includes a copy of the book *I Am Second*, the I Am Second conversation guide, and the I Am Second DVD-based study, film clips, sermons, and outreach tools.

The Web site has further expanded from its original video narrative content. It also provides the opportunity to chat, e-mail, or call a hotline 24/7. I Am Second expeditions promote missions around the world, and have recently put special emphasis on school and university groups. I Am Second is in more than 212 countries and boasts more than 7 million hits on its Web site. In October 2011, it launched a speaker’s bureau that features personalities (people featured on the Web site), spokespeople (those involved with ministry philosophy, biblical issues, and outreach strategy), and ambassadors (speakers formally affiliated with I Am Second).

In January 2012, Thomas Nelson published *I Am Second: Real Stories. Changing Lives*, by Doug Bender and Dave Sterrett. The book contains extended testimony of 22 people, all featured on the Web site. I Am Second began a year-long association with NASCAR with an outreach event in February 2012 at Daytona Beach, where it premiered a new I Am Second film featuring six NASCAR drivers. I Am Second may be found on Twitter and Facebook, and is mentioned at concerts and other events throughout the country.

Identity Politics

In social life, one is held accountable for being, or assuming to be, a particular kind of person—of a particular race and ethnicity, sex, gender, ability, sexuality, religion, age, and nationality. Many use these categories to understand oneself and others (for example, if a person identifies as Mormon, others may have some ideas about the person’s religious practices).

Identities can be avowed (self-claimed), or ascribed to a person by others; sometimes, one may not know the categories for which others may hold one accountable. Further, the identities that a person claims, or are assumed to be, can influence what the person can do, what the person can and should say, and how others may evaluate the person. In other words, identity is a social and cultural construction shaped by way of public policies that not only dictate what the experience of a particular kind of person is, but also restrict how this kind of person interacts with others.

For example, identities have influenced who people can love and marry (for example, relational and legal prohibitions against interracial, interreligious, and same-sex marriages), as well as if and where a person can work, eat, or attend school (for example, relegating women to the home or toward careers in nursing or teaching, rather than math or engineering). When these kinds of restrictions and evaluations happen, made possible by the existence and understanding of particular identities, this is called identity politics. Identity

politics is the attempt to discern what it means to be a particular kind of person at a particular time and place. Identity politics is an investigation into the ways in which the categories—the identities—that people claim, or are assumed to be, influence what they are able to say and do, as well as how others might evaluate them. Most often, identity politics focuses on how some kinds of people in some contexts are treated in humane and privileged ways, whereas other kinds of people are silenced, disregarded, or abused in the same (or similar) context.

Searching for Equality

A person interested in identity politics may investigate obvious discussions of identities, such as when politicians try to court the vote of particular populations (for example, Hispanics), or when male legislators try to determine the reproductive rights of women. A person interested in identity politics may also investigate more everyday situations in which identities matter, such as when a disabled man, thought of as intellectually inept because he happens to be physically disabled, is talked to with a childlike voice or is addressed indirectly through other members of his party, or when a Muslim girl is not allowed to wear her religious garb (for example, a hijab) at school because such clothing may make other people uncomfortable. A person interested in identity politics may also investigate the sense of community that identities cultivate, especially the traditions, cultural practices, and ways of speaking that comprise a particular group, as well as the rules about who can (insiders) and who cannot (outsiders) say disparaging words. A person interested in identity politics may investigate the media representations of particular kinds of people, as well as who is, or is not, able to speak on behalf of these groups. For instance, does a person who is disabled (visually impaired) have any right to speak for or about someone who is also visually impaired, or differently disabled (hearing impaired)?

In many instances, identity politics indicate a quest for equality by offering strategies that particular kinds of people can use to work against cultural structures that do not recognize them. For example, when certain groups seek protections from discrimination in the workplace, this is often done with the hope that everyone will be

given a fair chance to succeed. Or, if a group wants to make government buildings or Web sites more accessible, this is done with the intent to increase the ability for everyone to equally participate in social life. Or, if a group wants to fight for the legal right to marry, this is a move toward legal fairness for them. However, in such instances, dominant groups may not perceive such issues as quests for equality, but instead as threats to social order.

For example, a woman wanting to join the military may want to be treated like the men, but men in the military may not only feel threatened by the woman's presence, but may also not allow her to participate in certain tasks (for example, flying aircraft or fighting on the front battle lines). Or, an able-bodied business owner may feel as though the need to make a building more accessible is unnecessary, and that structural changes will tax financial resources. Or, a religious organization may feel as though the legal recognition of same-sex marriages violates religious freedoms.

Some identity politics indicate a quest for superiority. For instance, with racial purification and racial cleansing, certain populations were assumed to be better (for example, the Aryan race). Thus, by eradicating the "inferior" populations, the (perceived) superiority of one group could be maintained. In the United States, the perceived superiority of races was also a significant rationale for the ban against interracial marriages because outlawing the legal ability for people of different races to marry protected the dominant, perceived-to-be purer race from genetic "contamination."

Social Media

The emergence and rampant use of social media also complicates identity politics. With social media, people can more easily and explicitly mark, manage, and manipulate their identities. However, they can become reluctant targets of tailored messages, and possibly even victims of identity theft or cyberbullying (that is, online harassment for identifying in a particular way). Social media can re-energize specific groups that, before these media, were weakening in power and social influence (for example, the Ku Klux Klan); social media can also strengthen groups that, before these media, were not known to exist, or did not have much social clout (for example, the Tea Party). Social media can allow certain groups

to assemble quickly, efficiently, en masse, without the presence of media gatekeepers in order to change harmful beliefs and practices, and influence—and possibly even overthrow—problematic cultural authorities and political regimes. Social media now allow people to create and participate in niche virtual communities, thus allowing "underground" resistances and identities to come together, interact, and take action, without having to participate in public protests or rely on a physical meeting space.

However, in order for people to engage in these uses of social media, they must have access to and knowledge of how these media work. For instance, in order for a person to join a (underground) virtual community, the person must have access to and knowledge of a computer or a smartphone, the virtual location of the community, and the time to interact with community members. If a person wants to create cultural change, then the person must find ways, by way of social media, to employ change-related strategies with committed, like-minded others who may not reside in the same physical location. Or, if a person—maybe a politician—wants to appeal to a particular group, the politician should recognize that his or her message, among dense social media environments, may spread quickly, and possibly even erroneously, and that it may incite immediate action by active participants in these environments.

New areas of research have emerged within academic contexts, all tied to the study of particular identities. Scholars must continue to focus on the workings of identities in everyday discourse and to make attempts to understand—and possibly challenge—what it means to be particular kinds of people in particular places, at particular times, and by way of particular technologies. Situations in which people are singled out, not recognized, and told that they do not matter are encouraged to come together, in solidarity, as a member of a group.

Idlenomore.ca

Idle No More (INM) is a grassroots indigenous protest movement that originated in Canada and gained momentum primarily through digital and online activism. The movement, born in social media, helped to unite First Nations people and foster an awareness of the plight of indigenous peoples in North America. INM has also gained international prominence, with committed activists employing user-generated Web content as a tool to spread their movement's message. The vision of INM includes fostering sovereignty and nationhood for First Nations, pressuring industries and the government to protect the environment (for example, demanding sustainable development), and building allies to reframe the nation-to-nation relationship through the inclusion of grassroots perspectives.

The INM movement rapidly spread online and offline across Canada around October 2012. During that time, the country's federal government, led by Prime Minister Stephen Harper, introduced Bill C-45. Activists argued that the bill posed major threats to the environment. The introduction of Bill C-45 prompted four women in Saskatchewan, Canada—Jessica Gordon, Sylvia McAdam, Sheelah Mclean, and Nina Wilson—to organize an event, which they had scheduled for November 2012. They created a page on Facebook and called it Idle No More to help publicize this event. Supporters of the INM movement also employed Twitter to spread the word, using the campaign's hashtag #IdleNoMore, and tweeting comments and links to news items, blogs, photos,

Idle No More supporters from the San Francisco Bay Area displaying a banner at the city's 43rd annual Pride Celebration and Parade on June 30, 2013. Idle No More's Facebook page, begun in late 2012, had 110,000 likes by 2013.

videos, and other relevant media. Not long afterward, the movement went viral, and similar meetings were organized in the region around Canada.

Among Bill C-45's provisions that most concerned First Nations communities were the Indian Act, the Navigation Protection Act, and the Environmental Assessment Act. INM argued that the Indian Act would allow for the easier privatization of designated reserve lands and treaty territory because it would change the way that First Nations communities approved the leasing and surrender of these areas. According to INM, previously, a majority of eligible voters were required to approve such leases and surrenders. However, C-45 allowed approval to occur after a meeting for such purpose was called, and irrespective of how

many people attended the meeting, the majority of attendees voted to approve the lease or surrender. On the other hand, through the Navigation Protection Act, companies that planned to build oil pipelines and power lines in Canada would only be required to prove that their projects were harmless to lakes and rivers if such waterways were on a “protected” list prepared by Canada’s transportation minister. INM argued that because of amendments to this list, the number of protected lakes and rivers would drop by 99 percent, making most waterways vulnerable to environmental damage. In a similar vein, the Environmental Assessment Act reduced the number of projects that required environmental assessments.

2012 Protests

INM supporters vigorously used social media to mobilize and organize an offline and online National Day of Action, which they scheduled for December 10, 2012. Corresponding with this event, Theresa Spence, chief of the Attawapiskat First Nation, who would later become the face of the INM movement, declared a hunger strike on December 11, 2012. Spence intended to use her liquid-only fast to bring public awareness to concerns over Bill C-45 and the plight of the INM movement, and to increase support for the rights of First Nations peoples. Spence vowed not end her hunger strike until Prime Minister Harper would agree to speak with First Nations leaders to discuss Canada’s treaty relationship. She called for a day of protest to occur on December 30, 2012.

Harper then agreed to meet with 20 chiefs of the Assembly of First Nations (AFN), a group of leaders who represented the First Nations in Canada. The meeting took place on January 11, 2013, and on that day, INM organized a number of protests across major cities in Canada. The outcome of the meeting led Prime Minister Harper to vow a renewed focus on treaty relationships and claims. Although National Chief of the AFN Shawn Atleo declared the outcome of the meeting as an achievement, other First Nations leaders, such as Spence, held that the meeting fell short of what should have been accomplished. These differing stances illustrate the division among First Nations groups at the time, because some groups did not support the stances of INM. Spence ended her hunger strike on January 24, 2013—the day that chiefs of the

AFN had scheduled to hold a major treaty meeting in Vancouver, British Columbia. This meeting culminated in a 13-point declaration spearheaded by Spence, which sought, among other things, to implement and follow through the commitments made by the Prime Minister Harper in the January 11 meeting.

INM provides an excellent case of how social media united an indigenous resistance movement. Mark Gollum, a senior writer with the Canadian Broadcasting Corporation, equated the movement to the Occupy Wall Street protests that occurred in the United States in 2011, having a campaign that was also largely diffused via social media. Gollum quoted Canada-based sociologist Jeffrey Denis, who described the INM movement as diffused with no organizing structure, much like the Occupy movement. Yet, the protest movements’ tactics differ in a number of aspects. In particular, while Occupy groups chose to indefinitely occupy spaces, activists participating in the INM protests primarily used temporary, flashmob-type events. These included round dances, teach-ins, ceremonies, and prayers in shopping malls and city centers. Activists supporting INM also employed direct action tactics, such as the use of blockades to disrupt major rail lines and highways across Canada. Various First Nation peoples, including the founders of INM, have questioned these direct action tactics for their aggressiveness. However, proponents of these direct action tactics have argued that they are necessary as a means to resist the loss of native rights.

2013 Protests

INM has gained worldwide attention. Around the end of January 2013, INM called for a worldwide day of action, and mass mobilizations occurred in a number of cities in Canada, the United States, France, and the United Kingdom. Amnesty International and the United Nations have issued statements in support of INM. In 2013, the INM Facebook page showed close to 110,000 “likes,” and an app called Makook, which tracks information on tweets, showed that close to 700,000 tweets had used the #IdleNoMore hashtag. While most of these tweets originated from North America, the app showed that some came from as far as Madagascar and Kazakhstan. Indigenous groups and other historically marginalized communities

continue to use social media as a resistance tool. INM is an exemplar of the power of social media in spurring on social change.

I-Docs.org

i-Docs.org is a Web site and symposium dedicated to the production and study of interactive documentary. Though in development since the 1980s, interactive documentaries have recently gained attention for their abilities to harness digital technologies, address political issues, and engage audiences. Judith Aston and Sandra Gaudenzi founded the Web site, while Arnau Gifreu and Mandy Rose serve as contributing editors. All four are European scholar-practitioners with experience in creating interactive documentaries, either independently or within media organizations, and in studying them. The Web site receives support from the Digital Cultures Research Center, which is connected with the University of West England, and with the Pervasive Media Studio, both located in Bristol.

To encourage discussion of the emerging genre, the i-Docs.org Web site primarily consists of a

blog. Posts fall under several categories, including activism, collaboration, locative, play, taxonomies, technologies, transmediality, and news. Written by site editors and guests, posts explore questions such as handling narrative order, using social media, using new creation tools, and engaging audiences. Other posts highlight the presence of interactive documentaries at film festivals, such as Sheffield Film Festival.

In addition to the posts, the news section covers conferences and research calls related to interactive documentary. The site also offers references to academic and other sources related to interactive documentaries, as well as a listing of currently available ones. Along with the main site, editors at i-Docs.org also maintain other social media presences, such as on microblogging site Twitter and photosharing site Flickr.

A key activity of the site's founders is to define, theorize, and explore the implications of the interactive documentary toward understanding applications, possibilities, and limitations. An interactive documentary refers to a documentary that incorporates multimedia tools such as short video, hyperlinked pages, clickable maps, and chat functions in its representations of reality. This grounding in reality is considered the foundation of the documentary form, distinguishing it from fiction. Digital technologies are used not only in creating interactive documentaries, but also in distributing them to audiences. Unlike cinematic or television documentaries, interactive ones unfold according to how the audiences direct them, such as through a mouse, keyboard, or even a microphone.

Interactive documentaries change how political messages reach audiences. Instead of just presenting these messages through voiceovers and interviews within a linear, time-based construction, interactive documentaries offer the opportunity to bring audiences into these messages and their creation, making them into interactors, collaborators, and even contributors. For example, in addition to watching, audiences might click on maps or objects, watch short videos, offer comments, or even upload content. The ranges of audience experiences expand with the number of options they can pursue, and overall meaning creation becomes more actively shared. At the same time, though, the interactive documentary maker

loses control over how audiences experience the text, and thus how audiences receive the political messages. Yet, political interactive documentaries about social issues regularly appear, such as *Here at Home: In Search of the Real Cost of Homeless, GDP, and Bear71* from the National Film Board of Canada. The British Broadcasting Corporation also has an interactive documentary division.

Some of i-Docs.org's posts specifically address interactive documentaries and political questions, such as through defining key issues, making interactive documentaries effective, and determining their impacts. They address not only technologies that become part of interactive documentary production, but they also address how people engage with them. For example, one post delves into the issues of collaborative production within the Global Lives project, wherein 10 filmmakers from around the world record their days. The editing and other project decisions get made as a group toward the goal of showing these global realities and hopefully enlightening audiences about differences. Another post examines the "docugame," wherein serious, reality-based subjects become re-envisioned as interactive games.

The Web site's founders also organized two conferences addressing interactive documentary in 2011 and 2012. The 2012 conference built on the 2011 conference in focusing on four key issues: user participation, space, activism, and open source technologies. Several presentations addressed the possibilities for interactive documentaries and political issues, analyzing titles such as *Journey to the End of Coal*, the *Endangered Languages Project*, and *The Great Primate Handshake*. These presentations addressed the reach and effectiveness of these campaigns. The site's founders anticipate convening another conference in the future.

Also available is a specially themed issue of the prestigious international journal *Studies in Documentary Film*. The winter 2012 edition of the journal offers a wealth of articles discussing practical applications of the i-Docs concept as well as presenting original academic research on this and related themes, which were explored at previous i-Docs symposia.

Immersive Journalism

Immersive journalism is a recently introduced alternative form of journalism that allows the production and consumption of news in a form in which people can gain first-person experiences of the events or a situation described in news stories. This is achieved by integrating virtual reality into journalistic stories and by employing various technological applications, such as gaming, 3-D audio and video, haptic technology, and digital avatars. It uses already existing virtual worlds, such as Second Life, to create a space in which news consumers can interact through simulated environments and activities. The simulation is achieved by using head-tracked or head-mounted display systems (HMDs), lightweight helmets that cover the eyes and track head movements in order to create a sensation of having a virtual body in a virtual location.

Immersive journalism does not aim solely to present the facts, but rather to create an opportunity to experience the facts. It is inspired by the immateriality of digital media, but also by a larger, ontological state of being that is luminal, emergent, and transcendent. Immersive journalism appears to its supporters as a profoundly different way to experience the news, and to understand it in a way that is otherwise impossible without really being there. This new form

of journalism poses a great challenge to the long-established mainstream and traditional journalistic practice by promising and envisaging complete user control over the experience of a news story.

The foundations of immersive journalism lie in the idea that the news experience of a person is enhanced by his or her virtual involvement (as a digital avatar) in a digitally recreated scenario representing the news story. This way, the person transcends his or her news experience as a reader/viewer/listener/user by his or her involvement through 3D gaming (video gaming or online virtual worlds) and immersive technologies to a virtual witness/participant in the story, thus creating a sense of “being there” and of direct engagement in the news report. This way, news experiencing enables the participant to have a direct, unmediated, and first-person experience to the visuals, sounds, feelings, and emotions that accompany news reports and documentary films.

Immersive journalism belongs to the various approaches of interactive presentation of news in which the participant is entering the news scene either as himself or herself or as a subject in the narrative process of the reporting. He or she can enter the news story as himself or herself as a visitor, gaining first-hand access to a virtual version of the location where the story is occurring, or through the perspective of a character depicted in the news story.

Immersive journalism utilizes video and online gaming platforms as well as virtual environments to give a first-person dimension to news, documentary, and other nonfiction stories. Visual and audio primary source material from the physical world reinforce the concept that participants are experiencing a nonfiction story, with the video, sounds, or photographs acting on the narrative. For example, video that triggers at key points in the virtual landscape reminds a participant that the computer-generated environment is grounded in the physical world. Scripted events that create a first-person interaction with the reporting can also help create a feeling of being there. Also, participants can query or interact with the elements around them to learn more about the details or context of the news story.

The main difference between immersive journalism and news games is that the former involves

an experience in which the user is participating, whereas the latter is about playing a game. News games follow gaming protocols in the sense that the player undertakes a task or pursues a goal and is constrained by rules, while the progress is measured by levels or points. On the contrary, a participant in immersive journalism is involved in an experience in which he or she is taking part and is affected by events, but may or may not have the possibility to change a situation following the news narrative.

Examples

The most notable and pioneering work on immersive journalism is undertaken by Nonny de la Peña, a U.S. journalist and producer and cofounder of Stroome.com (a collaborative video editing and sharing Web site) and senior research fellow in immersive journalism at the University of Southern California (USC) Annenberg School for Communication and Journalism. De la Peña integrates the modern technology of virtual reality with journalistic stories in order to depict real-life events. Her goal is to go a step beyond the third-party experience of learning about an event and allow the public to actually step into the event and participate in it. With her work, she aims to reinstitute the audience’s emotional involvement in current news events.

Some of the most notable immersive journalism projects include the following:

- The project *Gone Gitmo* is a virtual installation of Guantanamo Bay Prison in Second Life as a collaborative project between Nonny de la Peña and Peggy Weil.
- The project *Hunger in L.A.* developed by Nonny de la Peña focuses on calling attention to the growing issue of hunger in the United States by recreating an eyewitness account of a crisis on a food-bank line at the First Unitarian Church.
- *Condition ONE* is an immersive video player for the iPad, which allows users to simulate being in another environment, not quite virtual, but more a world that was captured using real video footage from a cameraman’s first-person perspective (e.g., video footage depicting soldiers

in battle and the Occupy Movement protests).

Immigration

Social media have become important parts of grassroots activism across many issues, but have been especially transformative in the area of immigration reform, in part because of their exceptional popularity among immigrants. In 2006, when immigration reformers gathered for a mass demonstration, the message was transmitted largely by Spanish-language radio announcers. Seven years later, a similar demonstration was organized by Twitter, e-mail, and text message.

Hispanics are not only the fastest-growing group in the United States and the largest immigrant group, they are—thanks to the population growth that makes them younger on average—the group most likely to use social media. The

Pew Research Center found that 72 percent of Hispanic Internet users are active on social media sites, while only 58 percent of all American internet users state the same. Similarly, Nielsen's 2012 Hispanic Market Imperative report found that Hispanic Americans outpace the American average in their engagement with smartphones, social networking, e-mail, text messaging, online video, and television.

While historically, immigrants have typically consumed media consumed in their home country or in their native language by fellow immigrants, the Internet has changed this and has encouraged immigrants to turn increasingly to the media of their host country in the form of social networks, Web sites, and online video. Further, while immigrants have typically primarily formed social ties with other immigrants until becoming well-established in their new home, in the 21st century we are finding immigrants becoming online contacts with native-born Americans very readily. Such online acquaintances help with language skills and cultural proficiency, as well as with political awareness and clout.

Hispanics were early adopters in using social media for political activism and vote drives. VotoLatino.com was founded in 2004 (in an attempt to defeat George W. Bush's re-election bid) by Maria Terese Kumar, who created the site on a laptop in a Starbucks coffee shop, with the goal of organizing voter registration efforts and encouraging communication among young Hispanic voters.

With the help of actress Rosario Dawson, Kumar sought out Hispanic Americans on Myspace, which at the time was the most prominent online social network. In the lead-up to the 2012 presidential election, social media played its largest role to date in registering Hispanic voters in support of incumbent Barack Obama. The large turnout rate of Hispanics, and the inability of the Republican Party to effectively outreach to Hispanic Americans, was widely cited as one of the critical factors not only in the 2012 results but is thought that it will influence presidential elections in the near future. While there are many reasons for Hispanics to be alienated by the Republican platform, immigration reform and the anti-immigrant stance of the Tea Party are certainly high on the list.

In 2009, *Latins in Social Media* (soon renamed *LATISM.org*) was founded to foster social media use, making cultural connections, and enhance political awareness in the Latin American community, including immigrants. The #LATISM hashtag is now viewed by more than 1 million people a week on Twitter.

The supporters of the Dream Act include a large number of young and tech-savvy immigrants and children of immigrants. A small group of undocumented students among them formed *Dream activist.org*, which originated as an online discussion forum for Dream Act supporters and young undocumented immigrants, and has become a deft public relations site for the act, highlighting individual stories. Journalist and undocumented Filipino immigrant Jose Antonio Vargas similarly founded *Defineamerican.com* to highlight the stories of immigrants and break down the stereotypes of the “illegal Mexican.”

Organized Movements

In May 2013, a 48-hour virtual iMarch on Washington was held on Twitter in the name of immigration reform, resulting in thousands of tweets directed at numerous recipients, for a total of more than 500 million “landings.” The name iMarch was both a play on Apple’s branding (social media being as associated now with iPhones and other mobile devices as with computers) and an invitation to offer a personal testimonial in support of immigration reform. The event was part of a larger effort by Latino activists and allies on both sides of the aisle, not only to mobilize their supporters, but to rally the political leverage of undocumented immigrants. Support was tweeted by prominent political and celebrity allies, including President Obama; Cory Booker, New Jersey senator and former mayor of Newark; Arnold Schwarzenegger; and former president Bill Clinton.

The iMarch was organized by the Michael Bloomberg–founded Partnership for a New American Economy, a New York City–based immigration reform group. The iMarch provided a template for targeting members of Congress that the group continues to use. Social media was again used to organize an in-person demonstration later in 2013, when a nationwide immigration reform rally was held on October 5, 2013. Demonstrations were held in more

than 100 cities, including a 5,000-person march across the Brooklyn Bridge.

The immigrant community and their allies have also used social media to spread key information and identify solutions to community problems. Undocumented immigrants use social media and text messaging to network with friends in order to stay apprised of police checkpoints, an increasing danger at a time when immigration-motivated checkpoints have been doubled in some parts of the country; the state of Arizona has even encouraged racial profiling in its attempt to weed out illegal immigrants.

Facebook and Twitter are instrumental in the drive to sign students up for the deferred action program for undocumented immigrants and those with expired visas, for instance, which results in a two-year reprieve from deportation. The use of GPS data of users on platforms like Facebook and Foursquare has also been used to provide evidence of residency and length thereof. Many activists cite the famous case of Walter Lara, who opened a Twitter account during his deportation proceedings in order to reach out to anyone who could help. His first tweet was “I am being deported,” in 2009. A childhood friend started a Facebook page organizing help for Lara, who had been brought to the United States illegally from Argentina by his parents when he was 3, and was now 25. Overnight, there were 400 responses offering help and advice, and Lara soon obtained a year-long deportation deferment, which was renewed repeatedly. Lara was also able to find legal employment.

Political Use

Politicians also rely on social media to court immigrant voters. Because the bulk of immigrants living in the United States are Hispanic and the Republican Party has lost significant amounts of support in the Hispanic community, Democratic candidates have had greater success. Despite research by political scientist George Hawley that found that pro-immigration Republicans fare no better with Hispanic voters than other Republicans, Republicans who are part of the bipartisan push for liberalized immigration reform have nevertheless turned to Facebook, Twitter, blogs, and other means to network with immigrant groups and promote their alliance. Elsewhere, in districts with large immigrant populations, politicians often make a point

of noting on Facebook, Twitter, and other social media the celebrations and issues important to their immigrant constituents, such as celebrating Chinese New Year or observing the anniversary of India's independence. In this case, social media has extended the tradition of the "photo op," in which a politician takes a small amount of time out of their day in order to make an appearance connected to a group or issue.

Independent Media Center

November 30, 1999, was one of the birthdays of social media and their political uses. Coinciding with protests against a meeting of the World Trade Organization (WTO) in Seattle, media activists, community journalists, and alternative media practitioners came together to start the first Independent Media Center (IMC, often referred to as Indymedia), a collaborative media operation with the goal to represent demonstrators' perspectives and provide a different account of the protests. They created not only a daily newspaper, a radio broadcast, and video reports, but also a Web site that was open for anyone with Internet access to upload text, images, audio, and video. Through this open publishing system, not only the media activists at the center, but potentially all protesters and concerned citizens could post reports and commentary to a global audience. And that audience read, watched, and listened: the site registered over one million hits during the days of the protest.

The Indymedia concept rapidly spread around the globe. A total of 150 local IMCs had been created by 2004, a global network of citizen journalism. Some were national groups, others were city based; some were created by coalitions of existing alternative media groups, others by new media geeks; some were set up for reporting large protest events, others for regular local news coverage. Yet, all of the local Web sites included an open posting mechanism that allowed members of the public to publish their stories, and typically featured an open newswire on the right side of the page. The local groups were connected through a common set of principles on openness and nonprofit alternative journalism, the shared use of technical resources, and the collaborative ethos of the Free and Open Source Software (FLOSS) movement.

They benefitted from transnational technical support, contributed to the global Indymedia Web site that served as aggregator of local stories, and participated in discussions and decision-making structures via network-wide e-mail lists. Spanning across a variety of topics, from finance to gender, and involving hundreds of

There were 150 Independent Media Centers around the world by 2004. This banner hanging on a building in Amsterdam in the Netherlands featured an Indymedia Netherlands Web site address while expressing support for strikers in Oaxaca, Mexico, who suffered from a violent crackdown by police in summer 2006. The text translates as "Mexico murders/Oaxaca is everywhere."

IMC activists, these openly archived lists constituted a rich online public sphere and space for complex participatory and democratic decision making. IMCs also expanded to the offline world, for example, by building technical infrastructure for protest camps and creating public access points in the middle of demonstrations. Computers and other equipment were shipped to partner groups in the global south (e.g., in Latin America and Africa) in practical attempts to bridge digital divides.

As an early form, as well as one of the more politicized versions of civic journalism, the IMC network was confronted with many of the new challenges of this emerging field. Its open platform and politically motivated approach led to questions regarding its trustworthiness, and opened doors for rumors and false information, and the quality of articles widely varied. Several times, government agencies seized IMC servers, demonstrating both the threats and vulnerabilities of open online platforms. In response, IMCs

experimented with different levels of moderation, and if necessary, censorship of their open posting newswires, leading to more regulated forms of openness. Yet, they continued to advocate two characteristics that became key components of the new citizen journalism sphere: a radical subjectivity that breaks with the attempts of objectivity and impartiality of traditional journalism, and is instead explicit about its vantage point; and a crowd-based journalism that seeks the truth through a multitude of voices, eyes, and comments, similar to the practices of open source software and Wikipedia.

In the mid-2000s, the steep rise of Indymedia was stopped and reversed. Its organizational model, based on online exchanges and volunteer labor, met increasing challenges; the wave of transnational protests that had carried the IMCs was in decline, and attacks from hostile governments added pressure. Perhaps most significantly, the rise of commercial social media platforms provided new opportunities for users to post their

stories and eclipsed Indymedia as the platform of protest and user-generated content. A new generation of activists now posts their videos to YouTube, stories are shared on Facebook, and pictures are posted on Flickr. Some local IMCs continue successfully, some are idle, and some have closed.

Despite its uncertain future, the IMC has been significant as a starting point for online citizen journalism, an early experiment of social media and a milestone toward Web 2.0—without the startup capital of the more recent social media enterprises, and organized in a decentralized, democratic way. It served as a key example for crowd-based peer production of content, and it has been one of the most prominent cases of Internet use by social and political activists. As a global hub of alternative media, it challenged established mainstream media at an unprecedented scale, and it built bridges between citizen-based old and new media practices, from community radio and video documentaries to online innovations.

The IMC's decline highlights the challenges to collectivist alternative media by new and more individualist forms of social media, but also the successful mainstreaming of the classic goal of alternative media—to turn the consumer into a producer. As concerns over online surveillance and the filtering practices of social media companies are increasing, the IMC serves as a reminder that nonprofit models of social networking based on anonymity and user privacy are possible.

Indexonensorship.org

Indexonensorship.org is a Web site for a publishing and campaigning nonprofit organization dedicated to promotion of freedom of expression around the world. Index on Censorship was founded in 1972 in London as a quarterly magazine with a circulation of 10,000 by poet and critic Stephen Spender. At its inception, the magazine provided space for dissident writers and thinkers from the other side of the Iron Curtain to publish their work and voice their opinions. Focused on the issue of global freedom of expression, the organization monitors and reports all forms of free speech violations around the world, including political, literary, religious, sexual, and ethnically motivated censorship and silencing. Among the original goals of the organization was to publish censored and “unpublishable” literature. At different points of time, the Index on Censorship published underground newsletters from Tehran in *Iranian Bulletins*, short stories by Russian writer and dissident Alexandr Solzhenitsyn, prose by Burmese political activist Aung San Suu Kyi, and commentary by controversial British Indian writer Salman Rushdie. The magazine also extensively covers instances of censorship in the cinema, visual arts, and music.

The magazine is published in three languages: English, Russian, and Arabic. Russian publication *Dosie na Cenzuru* was launched in 1997 with the financial support of Index on Censorship and the Glasnost Defense Foundation, a Moscow-based human rights nongovernmental organization. Initially, Index on Censorship provided some of the copy for the Russian edition, but the two publications now operate independently. Currently, an Arabic language edition of *Index on Censorship* is in the works.

The organizations' Web site was initially launched in 1997 as a blog, and relaunched in 2000 as a full-fledged online platform to support Index on Censorship's print publication and extend the organization's online presence. The Web site serves as a hub for all of organization's reporting and campaigning activities, and hosts all of Index on Censorship's writing, including some content from their quarterly magazine *Index on Censorship* published by Sage, such as originally commissioned articles, news reports, analyses, commentaries, and blogs on free

expression issues. The content is organized by geographic region, covering Africa, the Americas, Asia Pacific, Europe, the Middle East, and north Africa and around free expression issues such as access to freedom of expression, authoritarian states that attack freedom of expression, freedom of expression in the digital world, challenges to freedom of expression in democratic societies, and challenges for free speech created by religious and cultural beliefs.

Index on Censorship also publishes *Index Index*, a country-by-country chronicle of free speech violations. Part of the publication from its inception, *Index Index* presents a summary of free speech-related news items from nearly 100 nations monitored by Index on Censorship. In addition, indexoncensorship.org has a searchable database of reports, commentaries, and analyses on issues of expression that goes back as far as 1997. For example, the Web site carries an extensive archive of coverage of protests and subsequent arrests of the controversial punk rock band Pussy Riot in Russia, attacks on freedom of expression in Iran, controversy surrounding the publication of a cartoon depicting Muhammad by Danish newspaper Jyllands-Posten, and many landmark cases from around the world on Internet censorship.

Index on Censorship is not just a magazine and a Web site. Combining traditional journalism and campaigning practices, the organization uses its magazine *Index on Censorship* and online publication indexoncensorship.org to create a “noise of publicity” around issues that threaten freedom of expression and create censorship and oppression for journalists, writers, social media users, bloggers, artists, politicians, scientists, academics, activists, and citizens. This is done through extensive reporting, first-hand accounts, analyses, and commentary. In this way, *Index on Censorship* and indexoncensorship.org provide space for stories that do not receive adequate attention in the mainstream international media and a forum for creative thought and action in defense of free speech. For example, in the 1990s, *Index on Censorship* was among the first to report on fatal attacks against Russian journalists, which attracted the much-needed international attention and resources to combat the matter. As a result of its extraordinary efforts, in 2008, *Index on Censorship* magazine received an award from

Amnesty International for coverage of media reform in Russia.

Closely associated with the charitable work of the Writers and Scholars Educational Trust, Index on Censorship is actively involved in campaigns and advocacy efforts in defense of free expression. Index hosts an annual Freedom of Expression Awards, organizes debates in universities, and implements training programs for media workers to teach monitoring, publishing, training, and advocacy in freedom of expression in Africa, Central Asia, Eastern Europe, and the Middle East. For this reason, the organization’s Web site dedicates a significant portion of its space to campaigning and advocating for different aspects of freedom of expression around the world.

An active member of the Global Network Initiative, Index on Censorship also champions Internet and social media freedom. Index on Censorship CEO Kirsty Hughes is known for harshly criticizing the UK’s proposed regulations of news-related blogs on the Internet, arguing that it introduces a layer of undesirable political control on free expression in the digital world. Other current campaigns include the Libel Reform Campaign, advocating for free expression in Tunisia, Bahrain, Burma, and Azerbaijan, and campaigning against censorship in Europe’s last dictatorship, Belarus.

India

India is a culturally diverse country. Diversity of the people exists at many levels, including: geographical location, language and dialect, socio-cultural patterns and practice, and socioeconomic and education status. India is the second-most populous country in the world, with a higher percentage of youngsters. Diversity makes Indian culture different from other cultures. Sometimes, this creates social imbalance and unrest, which not only affects the basic social order, but also overall growth. Social media are the popular media among youth. Like other countries, social media in India are gradually affecting sociopolitical selection and the political system. People belonging to the 15 to 35 age group take part in social media conversations and write what they think about issues. People's views reflect the social condition of the society. In the last two years, people have shared their anger and frustration in the form of debates, conversations, and messages on Web sites, converting into protests on roads against the political class and governing system.

India is a democratic country, and follows a political setup that allows the citizens of India to elect the government, a federal government. The central government has greater power in comparison to states. India has 35 states, including seven union territories. These states show much diversity in their sociopolitical, geographical, and cultural setup. They have different political agendas, which create differences between central government policies and state priorities. At present, the United Progressive Alliance (UPA) is in power; this is the second term of the UPA. India is witnessing major changes and challenges in its political setup and system. Regional politics are more effective and altering national politics. This new trend has given birth to coalition politics in India. A coalition government has been in place in India since 1995, and has weakened the sociopolitical and governing system. It has created imbalances in power and has expanded differences between central and state governments. Corruption, poverty, high prices, and unemployment are the major problems that common people are facing while communal violence, terrorism, and casteism are some of the major issues affecting the integrity and security of India.

The legislature, executive, judiciary, and press are the four pillars of Indian democracy. Article 19 (A) of Indian Constitution provides freedom of expression to its citizens, with some restrictions. Both public and private media organizations in India play important roles in information dissemination. After economic liberation in 1990, the Indian market is open for foreign channels and private organizations. In recent years, the Indian media industry has shown progress, and analysts claim that it will grow quickly in the coming years.

Social Media

In India, social media have emerged as mediums of the masses in the last two to three years. They have played an important role in recent protests and have depicted social unrest. Social media were used in mobilizing people, mostly youth, in the anticorruption movement in 2011 and 2012. The anticorruption movement, mobilized by social media, was started in the wake of two major political scams: the Commonwealth Games in New Delhi, and the allocation of cell phone licenses. Around 12 million people registered their support for the cause. The movement was started under the leadership of Anna Hazare, a 72-year-old activist. Their demand was to bring the Jan lokpal bill (Citizens Ombudsman Bill) to remove corruption from Indian political and governing system. This was a revolutionary change in the history of protests in India, when thousands of people gathered to show their anger and frustration against political corruption and a faulty system.

India witnessed another public revolt mobilized by social media in December 2012. This protest was against gang rape in New Delhi. People demanded strong laws to punish the culprits and to give full protection to women by improving the system. People expressed their anger by writing on social media Web sites and blogs. Organizers of the protest used social media as tools to mobilize people and to garner their support.

India is a big market for Internet and mobile phone users. According to a report of the Internet and Mobile Association of India (IAMAI) and Indian Market Research Bureau (IMRB), the number of social media users in urban India reached 62 million by December 2012, and it was estimated to reach 66 million by June 2013.

Facebook, Twitter, and YouTube are commonly used social media network sites in India, apart from a large number of people who also write blogs. Generally, those in the 15-to-35-year-old age group use social media on a daily basis.

Unlike other countries, social media are not popular, and are not used very effectively by political parties for obtaining votes in elections or to keep people updated and informed about different government policies and programs. Few politicians and representatives of political parties are active on social media Web sites like Facebook and microblogging network Twitter. After recent agitations and protests mobilized by social media, the government has realized the potential of social media and planning to include them in their outreach activities and to use them to reach to the people. Certain political parties have social media cells, which they use to write against rival parties.

In 2012, there was an ethnic conflict in India's northeast state of Assam. The conflict erupted between two communities, the Bodo native tribe of Assam and Muslims. According to news sources, most of the Muslims living in Assam are migrants from neighboring Bangladesh. Communal violence erupted after the murder of three Bodos by Muslims. For retaliation, both the parties started killing people; and from fear, thousands of people left their villages and homes and took shelter in refugee camps.

The Muslim community living in other parts of the country opposed the killing of Muslims in Assam, and started protests in major cities of India. Some of the protests turned violent and killed civilians. Northeast people living in other parts of the country received threat messages through social media. Doctored messages and images were sent through social media to provoke people to take revenge against northeast people. In reaction, thousands of northeast people started going back to their home states. This mass exodus created panic, fear, and chaos. The government banned Facebook, YouTube, and other social media Web sites, and blamed Pakistan for uploading and sending doctored images and messages to provoke people and create communal tension. In this incident, social media was used to disturb the communal harmony, law and order, and sociopolitical system in India.

After this incident, the government is planning to make policies for social media. As a democratic country, regulation will be difficult. In India, public broadcasting services are run by the government and work as a mouthpiece of government, while it has been observed that private or mainstream media work mostly on selected agenda's and for monetary and business gains. Social media have given voice to the common people and are not biased. People feel empowered by expressing their views and opinions on social media.

To control cybercrime and cyberbullying, India passed the Information Technology (IT) Act in 2000. It was passed again by Lok Sabha (the parliamentary body) in 2008, after amendments were made to the original act. Some of the

A student protester climbs a lamppost during a protest against the 2012 gang rape case and violence against women on December 22, 2012, in New Delhi, India.

sections of the IT Act 2008 are implemented to control and filter out social media content. Section 69 of the IT Act empowers the central government/state government to intercept, monitor, or decrypt any information generated, transmitted, received, or stored in any computer resource if it is in the interest of the sovereignty or integrity of India, defense of India, security of the state, friendly relations with foreign states, public order, for preventing incitement to the commission of any cognizable offence, or for investigation of any offense.

In time, people in India will use technologically updated communication devices and advanced information-sharing networks and platforms. Different political sections are mapping existing possibilities of social media to reach urban youth and attain their votes in parliamentary elections in 2014. The ruling party and opposition in the center are also looking at different options for utilizing social media to make their presence on social media Web sites to counter political propaganda. Social media connect people and keep them updated; they start a thought process. Open dialogues motivate people to think differently—this initially creates a feeling of unrest and frustration, but brings major changes. In India, social media will help in bringing changes to the political and governing system.

Indonesia

The Republic of Indonesia is a diverse country located near the equator between the Indian and Pacific oceans in southeast Asia. Indonesia is an archipelago with over 17,000 islands, of which 5,000 to 6,000 are inhabited. There are 34 provinces. With around 240 million people, it is ranked the fourth most populated country in the world after China, India, and the United States. Indonesia also ranks as one of the largest democracies in the world.

Between 80 and 90 percent of the population self-identifies as Muslim, which makes Indonesia the largest Muslim-majority country in the world. It has almost 13 percent of the world’s Muslims. Indonesia is within the top 20 of the world’s economies for gross domestic product (purchasing power parity), but is still often called a developing country because of challenges related to poverty, unemployment, infrastructure, political and economic instability, corruption, public health, education, and the environment.

One particular area of rapid growth and development, however, is communication technology. Indonesia is currently experiencing a “digital jump,” whereby the country’s population is shifting from the building of traditional infrastructure, such as telephone landlines, to mobile devices. Close to 40 million Indonesians use a mainline telephone, while mobile phone penetration is close to 100 percent, and is expected to surpass that percentage within the next few years. Having a phone does not necessarily mean full access to the Internet, though. Statistics vary, but estimates are that from 45 to 50 million, or around 20 percent of Indonesians, are Internet users. These numbers are expected to surge as more mobile devices offer online access and companies provide more affordable communication options. This phenomenon has significant implications for social networking, business, and politics.

The Indonesian telecommunication industry is very competitive. The three major telecommunication companies in Indonesia are Telkom (semi-privatized, majority-state owned), Indosat (partially state owned, mostly foreign shares), and XL Axiata (privatized and foreign shareholders included). There are also other smaller telecommunication competitors in the sector. Since

1999, deregulation and strong market rivalries have contributed to affordable mobile services and contracts for many Indonesians. Inexpensive phones or handsets, especially from China, facilitate mobile access. Personal computers are not as common as mobile devices. All of the telecommunication companies pay close attention to price points, network coverage, call quality, and speed to stay competitive and avoid losing their share of the market. Telkom currently holds between 50 and 60 percent of the market share, while Indosat and XL Axiata are more closely matched around 20 percent each, and retain the remaining market share.

Most mobile device and Internet users are young, under 40 years old. The overwhelming majority of mobile phone customers use prepaid or “pay-as-you-go” services, especially among the 15-to-20-year-old set. There is high preference for free to use services like chat applications and low-cost options like texting. This preference has led to the popularity of Research in Motion’s Blackberry brand. While Blackberry use has significantly declined in other parts of the world, Indonesian customers continue to be loyal to the brand. The youth market is also quick to adopt or experiment with new services and applications. This openness has translated into high rates of social media usage. Analysts anticipate these rates to increase further as more Web-enabled phone plan options enter the market.

The most popular platforms for social media in Indonesia today are Facebook and Twitter. Indonesia consistently makes the top-five list for most Facebook users globally. At last count, over 47 million Indonesians were active Facebook users. Indonesia is also one of the top-five countries for Twitter, with around 29 million users. Jakarta, the capital of Indonesia, recently ranked number one on a list of the top-20 cities in the world by number of posted tweets. Online media monitoring companies such as Brand24, Semiocast, Socialbakers, and Mediabistro have found that Twitter users in Jakarta posted more than two percent of the 10.6 billion public tweets posted worldwide. Bandung, another sizeable metropolitan area in Indonesia, ranked number six worldwide for posted tweets. The social media landscape in Indonesia can be divided into three main subject areas: social networking or communication and

entertainment, business (e.g., brands), and politics (e.g., mobilization, critics, and education).

Social Networking

Indonesians use both Facebook and Twitter to connect with their family, friends, acquaintances, and coworkers. Both platforms provide users the ability to update one’s community about a range of topics and personal interests. Examples include everyday behavior, special events, hobbies, travels, sports, celebrities, television shows or movies, music, religion, political preferences, current news, and questions or requests for assistance. Indonesians tend to use Facebook and Twitter to keep in touch, share memories, learn new things, promote oneself, maintain friendships, and have fun.

Facebook users can create profiles, upload photos, list contact details, send private or public messages, chat in real time, create or join groups, link to other Web sites, play games, and show support for others by clicking “like” on a post or page, signing a petition or some other action item, and sharing or forwarding material to others in their online networks. Twitter has less variety than Facebook regarding program functions; it primarily focuses on brief commentary and building a following, or subscribers, to a particular person’s account. Twitter users can update their profiles with their mobile phones via text messaging or special applications on select smartphones.

Business

Indonesian entrepreneurs and businesses utilize social media to build and advertise their brands. Large businesses such as Yamaha Motor Indonesia, Surfer Girl, Blackberry Indonesia, Chocolatos, and Axe Indonesia each have between 1 and 3 million Facebook fans. These companies post information about their products, sponsor contests, experiment with applications, and encourage interaction with consumers by soliciting comments, photos, and videos. Occasionally, Facebook users will post a criticism or concern, which may or may not be addressed by the company. Depending on the company and type of campaign, there may be cross-postings or overlap between Facebook and Twitter. Businesses of all sizes adapt to their consumer base’s demographic backgrounds. They emphasize

culturally and linguistically appropriate content. For instance, many brands make a point to observe religious holidays. They also self-censor their quotes and pictures to fall within expected norms or boundaries.

While brands are able to spread the word about their identities and products via social media, there are obstacles for converting such publicity into profits. Indonesia is still predominantly a cash-based economy. Limited credit card usage and online bank accounts make it hard for individuals and businesses to make financial transactions easily or regularly via mobile phones. Although e-commerce is still in its infancy in the country, there are firms interested in identifying growth opportunities. Test markets in other developing countries suggest that online retail and microtransaction markets could be possible and potentially lucrative in Indonesia.

Politics

Indonesians make use of social media for political purposes. Topics covered on Facebook and Twitter include public policy debates, social causes, campaigns, and elections at the local, provincial, and national levels. Political candidates and parties, nonprofit organizations, activist groups, and others are increasingly turning to social media to disseminate information, educate, critique, and mobilize Indonesian “netizens.” Facebook and Twitter are often perceived as public platforms for free speech, deliberation, and possible activism. Underrepresented and marginalized groups such as women and lesbian, gay, bisexual, and transsexual communities have used social media to combat prejudice and discrimination and generate solidarity. Social media has also been used to facilitate government accountability. In early 2012, for example, the Indonesian Students Association turned to Facebook and Twitter to report on the perceived financial waste of certain lawmakers who went shopping in Berlin. There was a public outcry about using government business as an excuse for a paid holiday vacation.

Politicians also make use of social media. Joko Widodo used Facebook heavily during the September 2012 gubernatorial elections in Jakarta. His strategy involved online posts and commentary, a music video, and organizing a flash mob. He continues to use Facebook after winning,

along with YouTube to post videos of official meetings in an effort to demonstrate government transparency. While some analysts attribute Joko Widodo’s success to a unique, tech-savvy media campaign, tracing a causal relationship between being a “fan” of political candidates or parties on Facebook or following them on Twitter and actually winning office is still relatively tenuous.

While there appear to be several benefits from social media in Indonesia, there may also be disadvantages. As with any new technology, much depends on who is using the medium and for what purpose. Scientists do not yet know the precise boundaries or limits of virtual movements. People do not necessarily have a clear picture of how to translate discussions via social media into real policies, reforms, or political participation, like voting and protests. Facebook and Twitter users may also be self-presenting in “biased” ways, which could obstruct change, progress, or democracy. Furthermore, quantitative and qualitative data are currently limited about issues such as illegal activities, culturally sensitive material, and possible or actual security breaches and threats. As businesses, governments, and researchers continue to explore and analyze the development and use of social media, it will become more evident how and to what extent mobile devices and the Internet are helping or hindering the nation’s people and institutions. As more research think tanks and online or social media monitoring firms emerge and grow, social scientists will be in a better position to accurately and efficiently measure Indonesian public opinion, political behavior, economic matters, and cultural shifts in the future.

Inferring Sentiment

In 2006, Google developed quality scores to quantify the degree to which their search engine was meeting users' needs. This is believed to have been the first step toward the application of sentiment analysis to social media. Inferring sentiment is the systematic analysis of social media content, such as the text of blogs and forum posts, in order to discern the attitudes expressed in them. As a relatively new endeavor, methods for inferring sentiment from social media continue to evolve. In its simplest form, sentiment is inferred from the number of positive and negative expressions in selected online user-generated texts addressing specific matters of interest, such as the viability of a political idea or the likability of a political candidate. Positive and negative sentiments are determined using generic lists of positive and negative words or lists of words and phrases developed specifically for particular content areas. Other filtering mechanisms and machine learning processes are also employed to differentiate positive and negative sentiments from neutral and unrelated text and to discern sarcasm, casual language, and other language complexities that increase error. Typically, the goal of sentiment analysis is to gauge aggregate sentiment.

Inferring sentiment from social media content is becoming a highly valued and widely used resource. Businesses are prolific users of sentiment analysis, and intelligence agencies have used sentiment analysis to identify action plans of extremists and to help determine such things

as regional sentiment toward the 2009 hotel bombings in Jakarta. In the political arena, sentiment analysis is on its way to becoming a routine and necessary feature of a variety of political endeavors. User-generated text in political and news blogs and posts to news forums and politically oriented Web sites provide a plethora of data sources for inferring sentiments about political positions, candidates, and policies. The use of social media analysis by President Obama's re-election campaign has been credited with providing him with a critical advantage over his opponents. Sentiment analysis then can be used to discern such things as what constituents desire, what legislation or social policies are likely to be supported by the general public, and public reaction to how policies are framed and how politicians present themselves.

A critical component of success for businesses these days is the utilization of sentiment analysis to monitor consumer preferences and product reviews offered online because of the potential impact that such independent evaluations of their products could have, given the unprecedented number of people from around the world who can readily access such reviews. As with consumer product reviews, social media allow for the possible inclusion of everyone's sentiments about political policies and candidates. The potential circulation of such sentiments to a wide audience, outside of the control of politicians and their carefully crafted messages, means that politicians might do well to follow the lead of businesses in assessing and monitoring such sentiments in order to keep abreast of how their constituents, opponents, and the general public are responding to dynamic political developments. The reverse is possible as well. Readily available political widgets track candidate sentiments on many topics, including controversial social issues, domestic and foreign affairs, and military involvement and budget allocations.

Benefits and Challenges

The benefits of inferring sentiment from Internet content in comparison to traditional opinion polling include its low cost, the availability of vast amounts of diverse Internet content to analyze, and the speed with which such analysis can be accomplished. Sentiment analysis can also capture

how aggregate sentiments evolve over time, and dramatic changes in sentiment because of unfolding events, with sentiment results generated as they happen.

Challenges with sentiment analysis are the subject of much current research. One problem with inferring sentiment from social media content is that people self-select themselves for participation by deciding to post their views online, and people with more extreme views are more likely to post their thoughts. Moreover, people often vary their posts based on the audience of a particular venue and based on what others have already posted on that venue about the subject. The difficulty in sampling Internet content in a manner that effectively attends to representativeness is a weakness of sentiment analysis. Despite these challenges, inferring sentiment from social media content is likely to expand, and even more sophisticated questions about what people think and feel are likely to be addressed. The systematic mining of sentiment in social media has just begun.

Influence on Elections

In a democracy, elections are the moment in which citizens, through the vote, declare their consent to a candidate, political party, or even a whole political system. They can also declare opposition to those, for example, through abstention, or what political scholars call the "protest vote." For this reason, issues about the influence of social media on election turnout need to be discussed in the framework of media and social theories.

They assign to social media a specific importance for the democratic process, because they are mediated public spaces for the exchange of information, constitution of relationships, expression of thought and organization among citizens, and serve political or civic purposes. Therefore, asking questions about social media influence on elections also implies taking into account theories concerning the deeper process of building consent, which is specific to political and social studies.

The focus of those studies is on the construction of relations between political representatives and citizens, also in social media environments, in a context of ideological dealignment, permanent campaigns, and disintermediation processes. In addition to that, an account of the most recent electoral campaigns' practices through social media will be necessary. Since the earliest studies about social media's role in the electoral process (around the first half of 1990s), much attention has been paid to the efficacy of Internet-based electoral campaigns, especially on the possibilities of translating corporate marketing strategies into the political domain. This perspective helps to highlight the horizontal logic behind social media and the possibilities to mobilize users for political action, evaluate the performance of the campaign, and predict electoral turnout.

Political Activism

Despite what many have been claiming about the "Internet elections" or "social media elections" since 2000, data from advanced democracies' elections show an increasing, but still marginal diffusion of Internet and social media usage by citizens who are seeking information about the candidates or engaging in online discussions about politics and electoral campaigns. For

example, during the last U.S. presidential elections campaign, which saw the broadest digital activism ever seen, 39 percent of the American adult population used social media to conduct at least one political or civic activity. The problem is that those activities widely vary in their importance for the public debate and in levels of engagement needed, from clicktivism, which identifies the simple “like” or “follow” in social networking sites, to digital activism repertoire and more traditional ways of participating transposed online, such as signing petitions and active campaigning (encouraging people to vote and organizing groups and meetings).

International surveys highlight instead that social media and the Internet are only a part, even if increasingly consistent, of overall media consumption. Social media are not a world apart from real life: they are embedded in everyday life activities and other media, like television. Media scholars talk about the “mediascape” or “media-sphere” when referring to the complex interrelations among all media and between them and the overall culture—the shared collective values, practices, and images—of a nation (or even the world). For that reason, it would be very hard to isolate the power or the influence of social media on electoral behavior or on elections, as much as it would be for any other medium. The temptation to assign media a power of direct influence upon opinions and behaviors is old, but it has never been proven. On the contrary, media have a role in the day-by-day construction of opinions and consent, played in their interaction with the social, institutional, political, economic, and cultural context of each person. Thus, studying media and social media’s influence on elections means taking into account all of the variables in play, in each country, at every moment.

At the same time, data from several studies point out that online political activism (however it is defined and articulated) does not necessarily overcome or replace offline activism, and it is still unclear whether or not the former can positively influence the latter. Scholars and media professionals are constantly trying to detect cases of online activism to vouch for social media’s role in participation in democratic processes, not only during electoral campaigns. The north African and Middle East uprising in 2010 and 2011

known as Arab Spring is a perfect example of the need to cross the boundaries of disciplines to better understand the phenomenon of online activism and its relationship with offline activism. Media and political scholars are both facing the challenge of new trends in political participation and democratization.

One can use expressions such as “networked politics” or “digital democracy” to point out the possibilities of social media for democratic functioning, also concerning elections. The democratic value of social media is controversial, and it is a current convention to divide positions into cyber-optimistic and cyberpessimistic (or cyberskeptical) accounts. Cyberoptimists describe the Internet as having high democratic potential because it provides more access to information and a space to express opinions, which in a deliberative democracy perspective is believed to be positively linked

A man takes pictures with an iPhone while using an iPad to display a collection of photographs of the Mubarak regime’s brutality during a January 29, 2011, march held in San Francisco, California, in solidarity with the Egyptian uprising.

to a healthy and active engagement in public issues. Cyberpessimists emphasize what they consider the dark side of the Internet, apparently neverending memory, winking to the Orwellian Big Brother when describing the surveillance society and the perils for privacy. It is now commonly accepted and confirmed by data that social media can reinforce involvement in political and civic affairs in subjects who are already involved in public life; however, social media is not the real engine for new involvement.

The interest in analyzing public engagement, and its role in democracy's health, has to be contextualized in a situation typical of most advanced democracies, in which political legitimacy is undermined and needs are continuously reaffirmed. Abstention is increasing, in parallel with a trend that assigns to oligarchies the role of managing political decisions. Voters are no longer tied to ideological belonging and party membership. Media have a specific role in influencing political communication practices through offering a mainstream popular culture imagination, specific in each country, but with some common elements, in a videocracy. Political scholars use the term *dealignment* to identify the process of disanchorage of voters from historical party belonging, which produces relatively new categories of floating subjects such as "the young," "the non-voters," and "the disappointed," who have to be persuaded to vote each time.

The media influence this process of dealignment, building new forms of relationships among politicians and the electorate, which appear more direct and disintermediated. Disintermediation is the answer to a political demand from citizens, who are asking to bypass the traditional intermediaries in public affairs, first of all political parties and unions. Social media seem to particularly fit in this model of relationship, and they contributed to build it: Through them, citizens can directly dialogue with politicians and other citizens easier than before. Media are also influencing the political context by setting up standards to evaluate political performance, and scholars have pointed out that those standards are closely related to those for choosing products to purchase. Some call "Americanization" the process of translating every aspects of life, including politics, in terms of consumption. That is why the perspective of

political marketing helps to understand media's, and in this case social media's, role in the political process.

Influence on Electoral Campaigns

Social media's influence on elections can be read from the point of view of electoral campaign organizers. Social media are contributing to the design and creation of contemporary campaigning repertoire, as the proliferation of digital, new media, or social media divisions of electoral committees suggests (at least in the United States, the United Kingdom, and more recently in France). When facing social media environments, campaigners first tried to import expertise, methods, and techniques from public relations and corporate marketing. The result has been a combination of tools with a specific orientation to create relationships between candidate and citizens, involve them, and promote their action and mobilization through social networking practices.

It can be useful then to read the complexity of a campaign through the lens of political marketing. Political marketing has been defined as the use of marketing strategies, philosophies, and tools by political parties to raise interest and consent from voters. The four "Ps" of the corporate marketing mix can be applied to the political realm as follows: the product is the party, or the candidate, or even the policy that is to be sold; promotion and place concern all communicational and organizational aspects of a campaign; last, the price is the vote, which is given in exchange for the promises made by parties and leaders about what they are going to do when elected.

In this framework, social media may influence electoral campaigns by working on the first of the marketing mix, the product. In the construction of the message, social media and new media in general can be used as a symbol for an alternative style of communication, in opposition to traditional media outlets, and this opposition can in turn conceptually be linked to alternative political methods, far from the centers of power and institutional rigidity, closer to common people's real lives and spontaneity. This link lies on a sort of ideological position, claiming the Internet as providing a nonmediated space and resources for direct democracy, as in ancient Greece. However, despite the rhetorical use of social media

for electoral purposes, on many occasions, the Internet truly represented the only available platform to reach the audience and to try to influence the public debate. When traditional media are inaccessible because of power issues, or prohibitive because of high cost, insurgent subjects such as social movements, independent politicians, or new candidates have used digital media to compensate. In fact, social media can provide candidates a platform for fundraising, by collecting microdonations from supporters (which cannot replace corporate sponsor and party support, but can contribute to finance the campaign and raise the sense of belonging). Most of all, social media can help insurgent candidates who can try to exploit the viral potential of spreading pieces of information through social networking practices when traditional media pay them no or little attention.

Social media influence on elections can thus be studied as the influence of social media on the promotion and place elements of the marketing mix. Networking practices are the main element of this influence: Supporters can actively seek for more supporters among their friends and contacts in social networking sites, involving them in the campaign, inviting them to do the same, organizing meetings or joining already formed groups in the surroundings. This allows campaigners to reduce the budget for online promotion activities such as advertising, and this is also the reason for the increasing interest in promoting online engagement and activism.

Following the principle of viral marketing, once the network of affiliation is created, campaigners have to seed information, trying to reach the most influential subjects first (individuals who have the largest number of connections) in order to make information visible to the largest possible number of people. Disseminated supporters in almost every corner of the Web can also function as ears and eyes for campaigners, helping them to detect ongoing negative campaigning and providing an instant fact-checking service.

Electoral Data

Social media are mostly used in political campaigns as low-cost sources of information about voters in order to segment the electorate, position the candidate, identify the target of communication

strategy, and reach potential voters through a mixture of traditional and unconventional techniques. Social media provide analysts and marketers with a huge amount of data, called “big data.” When people sign into a social network site, they cede pieces of information about themselves: once ceded, those data about consumers’ and voters’ interests, tastes, and relations can be extracted and analyzed through software, helping marketers or political strategists to know the audience of consumers/voters and get in touch with them. In this perspective, social media are most of all powerful and cheap tools used to acquire data about citizens’ contacts, habits, and preferences, and to sell them a product, the politician, by manufacturing the most effective message or by placing it in the right network. Some argue that Barack Obama’s victory in the 2008 presidential elections was partly because of the great database built during Howard Dean’s run in 2004: In this database, the names, addresses, and e-mail contacts of Democrat voters were contained, so it was easy for Obama’s staff to reach and mobilize them.

Another way in which social media intervene in the design of an electoral campaign is in the attempt to measure consent prior to the elections, as in polls. Social media monitoring is the complex activity of listening to and analyzing social media data in order to capture the general trends of a brand’s reputation and detect possible crisis. Like polls, the aim of those activities is to describe people’s attitudes and perceptions with regard to the candidate, but unlike the first, social media monitoring is less expensive and time consuming, although it is not representative of the entire population (at least as long as a digital divide is in place). The focus on analyzing consent through social media has raised questions about how to measure it, probably along the lines of the need for calculating the return on the increasing economic investments in social media strategies.

To answer those questions, a quantitative approach has been developed, relying upon Web metrics such as Twitter “followers” and/or Facebook “likes” counts, but also sentiment trends detected in textual corpuses. The consent for the politician in social media is then planned, calculated, analyzed, and even predicted, as for every kind of brand, because parameters and metrics employed to evaluate the success of online

corporate marketing campaigns have also been adopted to evaluate the effectiveness of online political marketing campaigns.

Although most research shows no significant correlation between social media metrics and voter turnout, some scholars, journalists, and politicians still continue to superimpose the concepts of efficacy of online political marketing strategies and influence of social media on elections. Social media are used as alternative tools to traditional polls in order to observe and predict the consent for a candidate or a party. This (theoretical) link is not free of consequences: in particular, this vision of social media recalls deterministic information theories, according to which exposure to a message would have an effect on people's thoughts and behaviors. Social media do not have a natural and necessary power to influence voters' perceptions and behavior. Social networking practices can be planned and carried out following previous cases of successful campaigns, but it would be better not to evaluate this success only in terms of election turnout because there are many examples of perfect social media campaigns, where candidates eventually lost the elections.

Social media's influence on the "price," or the vote, is a difficult stance. It would be better to examine the role of the Internet as an infrastructure for data transmission. In democracies where voter registration is needed, such as in the United States, the Internet has been used to provide voters the possibility to register and find the nearest polls. The Internet represents a facility for citizens in terms of speed and immediacy, and it can hinder abstaining, which is one of the major problems in contemporary advanced democracies. Although it is not a specific function of social media, e-voting or electronic vote systems are already used in different countries, even if they are still experimental (e.g., in primaries or in administrative elections, not yet in political or general consultations).

Most scholars agree that candidates never won an election solely by designing the perfect online campaign or by crafting the perfect communication strategy. Electoral campaigns are as much field and territory operations as media events and social media presence: conventions, meetings, and groups, even organized through social media, are still important moments in electoral runs, in

which people build their sense of belonging and networking is put into practice. The success of an electoral turnout cannot be ascribed only to communicative aspects, which are important, but are combined with other elements such as political context and culture, social and economic conditions, and the institutional framework.

Infographic

Infographic, a contraction of information graphic, is a means of conveying complex, quantitative or categorical data in visual form. The terms *infographic* and *data visualization* are sometimes interchangeably used. As the use of statistical information has grown in the study of politics, so has the need to find methods by which that complex information can be easily and intelligibly

conveyed. Infographics provide the essential messages behind numerical patterns in manners that popular audiences can grasp without needing to understand the finer details of how that information was collected or analyzed. Because of the visual relationships they create among geographic, temporal, and other kinds of data, infographics also allow more sophisticated analysts to observe patterns that they might otherwise miss. Finally, cognitive psychologists have demonstrated that visual representations of data aid comprehension and memory. Infographics thus provide different audiences with meaningful access to densely numerical or wordy information that they might otherwise incompletely interpret or recall.

Edward Tufte

Historians of data visualization identify ancient geographic and astronomical maps as among the first infographics. With their graphical representation of complex geographical information, maps perform data visualization's essential task by providing a selection of simplified essential details in information-rich, but intelligible visual forms. In *The Visual Display of Statistical Information*, statistician and political scientist Edward Tufte observes the ways that geographic mapmakers paved the way for others to later merge geography with other forms of data. The 19th century contains a number of important examples of the evolution of data visualization. Effectively conveying the futility of Napoleon's 1812 march on Russia, in 1869, Charles Minard displayed the number of surviving French soldiers as a steadily narrowing stream along their geographic path between the Polish–Russian border and Moscow. Similarly, Dr. John Snow's 1854 mapping of the number of cholera deaths in central London revealed the geographic centrality of a single public water pump that Snow was then able to identify as a likely source of the infection.

Tufte, who remains political science's most cited authority on the aesthetics of infographic design, argues for the principle of high “data-ink ratios,” and increasing the amount of information available per inch of graphic. Good infographics should maximize the amount of information by removing unnecessary graph lines, labels, and distractions. Ideally, by using each recorded point to convey multiple measurements, Tufte argues

that a well-designed chart can convey a quantity of information that would require substantially greater page space if expressed in the form of numerical tables. Tufte also argues that the benefits of well-displayed data can provide critical advantages in decision making; as an example of this, he describes how charts mapping temperature with O-ring failure might have prevented the 1986 space shuttle *Challenger* disaster. Tufte's intellectual forbears include William Playfair, the 18th- to 19th-century economist and inventor of the major graph forms (including the line graph, bar graph, and pie chart), and semiologist Jacques Bertin, who systematized a set of retinal variables (shape, orientation, size, color, value, texture, and position) that help convey specific kinds of information to audiences of visual data.

Web Infographics

While Tufte's insistence on visual economy remains one important reason for researchers to convey data in visual form, infographics have also become more prominent as the audience for scientific information has broadened. While traditional publications remain important, the Internet allows researchers ever greater ability to disseminate information through institutional Web sites, personal blogs, and multimedia Web features on journalistic Web sites. The information offered through these broadly accessible portals must be easy for a wide array of people to interpret, and infographics provide one easy and visually appealing way to achieve that goal. Cognitive psychologist Stephen Kosslyn has developed a series of eight psychological principles for the creation of effective graphics, which he argues encourage the quickest learning and easiest retention. Attention to these principles—relevance, appropriate knowledge, salience, discriminability, perceptual organization, compatibility, informative changes, and capacity limitations—allows infographic designers to effectively connect with their audiences and to promote comprehension and retention.

While some work on infographics describes best practices for visual communication, scholars have also expressed caution regarding the potential for data visualization to confuse—or even actively manipulate—audiences. Geographer Mark Monmonier has pointed out how the simplification of graphics allows for active advocacy and deception,

distorting rather than enhancing a balanced view of complex information. By disregarding logics of scale, poorly conceived infographics can convey messages at odds with the numbers they ostensibly represent: for example, an object that is doubled in length along a horizontal axis may be quadrupled in perceived volume, creating the visual impression of a much larger numerical difference than is truly the case.

Information Abundance

The term *information abundance* refers to the idea of ever-increasing amounts of information on a wide variety of topics that becomes accessible to people via growing number of channels and from increasing number of sources. Technologically determined by its dependence on information storage capacities and communication channels' capabilities, as well as availability in terms of price and penetration, the phenomenon is of current interest in the age of the World Wide Web. While the gap between information supply and demand for it grows exponentially, accelerated significantly by the introduction of the Internet,

audiences find themselves in a situation of cognitive challenge. The information-age consumer has to rely on technologies and collaboration in an attempt to sort through and make sense of immense amounts of information that is now at his or her fingertips.

Technology, which created the information abundance in the first place, becomes the necessary tool of functioning in an information-abundant world. Some argue that such dependence on technology in information seeking and processing limits users' cognitive development. A relatively easy and aided process, information seeking in a situation of abundance reinforces adherence to the principal of least effort in audiences. Having to deal with tremendous amounts of information may be changing the ways in which people process incoming messages and assess their credibility. Heuristic, as opposed to systematic, ways of sorting through vast amounts of data are making way into user's preferences, discouraging mental effort. The other side of the argument, however, supported by research and speculation alike, illustrates lack of evidence for such claims.

One of the arguments in relation to information abundance states that emerging new technologies, instead of enriching information markets and contributing to the pluralism of opinions, facilitate imbalance and serve as an engine for Western cultural and political domination in the world. Control over design and production of communication technologies, and ownership of databases, expertise, and experience (determined in large part by accessibility of education) provide more developed Western countries, as well as private companies based in those countries, with greater ability to make use of and benefit from information technologies. On the other hand, the phenomenon of information abundance arguably levels the field by providing cheaper, easier access to information, resulting in further education and expertise. The idea of information abundance is closely related to the phenomenon of information overload, researched mostly within the fields of psychology and organizational sociology. While testing the influence of plentiful and excessive information on human capability and decision making, researchers tend to agree that scarcity of time, not the excess of information, usually becomes the key impairing factor in decision making.

In the era of information abundance, the information supplier (media) loses control over the audience's agenda. Researchers suggest that the process of news editors essentially telling the audience what is important is being reversed with the help of new technologies (such as new search engines on the Internet). Instead of receiving and sorting through the information pushed on them by traditional media, the news consumer pulls (with the help of technology) the information that he or she needs from the vast supply. While generating fair amounts of controversy about possible adverse effects on society, development of communication technologies and resulting information abundance find appraisal in making citizen science and citizen journalism possible, giving voice to greater numbers of people, simplifying access to knowledge and education for the underprivileged. The notion of information abundance did not appear with the development of the Internet and emergence of social media. The latest advances in technology, however, provided an unprecedented acceleration in rates of accumulation and distribution of information. New groups gain access to information and produce unique messages that become available to the public. While ill-researched at the moment, the effects of information abundance are yet to demonstrate themselves fully.

Information Aggregation

The World Wide Web has changed dramatically in recent years, not just in sheer number of users, but, in particular, in the new forms of participation it offers. Web 2.0 technologies now make it potentially possible for every Internet user to have a voice and a worldwide audience—linking people from around the world in an unforeseen way—and have been hailed as a new paradigm in Internet communication.

The rise of social media sites, such as blogs, wikis, Digg, and Flickr, among others, underscores the transformation of the Web to a participatory medium in which users are collaboratively creating, evaluating, and distributing information. Social media sites share four characteristics: (1) Users create or contribute content in a variety of media types; (2) users annotate content with tags; (3) users evaluate content actively by voting or passively by using content; and (4) users create social networks by designating other users with similar interests as contacts or friends. This entry is to present the basic ideas of information aggregation.

Social media not only allow public relations practitioners to reach out to and engage their publics in conversation but also provide an avenue to strengthen media relations. More advanced users have a greater feeling that social media have been integrated widely into the industry than those who are using more common tools. Information aggregation is a formal framework in which are expressed means and tools for the alliance of information originating from different sources. It has been stated that a group of individuals who have to choose one of two alternatives by expressing their individual opinions, with the final verdict determined according to simple majority rule based on these opinions, would likely make the correct choice. Moreover, as J. Paroush states, this likelihood would tend to become a complete certainty if the number of members of this group tends to infinity, and this statement lays the foundations of the ideology of the democratic regime, providing the theoretical justification of democratic participation in public affairs and in social choice.

Condorcet Jury Theorem

The Condorcet jury theorem gives certain conditions under which majority rule is superior to dictatorship for a society composed of individuals with identical preferences, but diverse information. A precursor of the statistical fact known as the “law of large numbers” shows that the decisions made under majority rule are asymptotically perfect as the population of voters becomes large. A. McLennan believes it is generally the case that the probability of making the optimal choice converges to one, as the number of voters goes to infinity.

The formal framework is explicitly based on the idea that political institutions have a constructive role to play in order to allow for an efficient aggregation of all the socially useful information that is dispersed among individuals. T. Piketty believes that it states under which conditions majority-rule voting yields efficient information aggregation.

The Condorcet jury theorem provides a theoretical basis for democracy, describes K. K. Ladha, assuming that a population of size n has to choose between two possible policies $P = A$ or B , and that all agents have the same state-dependent utility function $U(P/s)$: If the state of the world s is equal to s_X , they all prefer policy X to policy Y , $U(A/s_X) > U(B/s_X)$, and conversely, if $s = s_Y$, $U(B/s_Y) > U(A/s_Y)$; further assume that all agents have the same initial prior beliefs about the state of the world $\mu_0(s_X) = \mu_0(s_Y) = 1/2$ and that they all receive a signal $\sigma = \sigma_X$ or σ_Y drawn from the same conditional distribution, such that $\text{Prob}(\sigma = \sigma_X/s = s_X) = \text{Prob}(\sigma = \sigma_Y/s = s_Y) = p > 1/2$. Then, the Condorcet jury theorem simply states that if free elections are held, then the probability that the efficient policy (X in state s_X and Y in state s_Y) wins a majority of the vote tends to 1 as n goes to $+\infty$. In other words, majority-rule voting allows efficient information aggregation, and nobody would prefer to be a dictator. Piketty observes that this result is a trivial consequence of the law of large numbers, but it is powerful.

Role of Elections

Concerning political institutions, Piketty proposes that electoral systems need to be complemented by nonvoting institutions, and in particular by political parties, in order to achieve efficient information

aggregation. A central role of elections is the aggregation of information dispersed within a population. T. Feddersen and W. Pesendorfer explain that elections have two distinct roles in society. First, they serve as a mechanism to decide policies when individuals disagree about appropriate action. Second, they aggregate information dispersed in the population.

Why are policies influenced by polls? One possibility is that polls aggregate information dispersed among affected constituents. Policymakers are often reluctant to say that this purpose guides policy at all. President Kennedy, for instance, famously kept his polling numbers locked away in a safe in his brother's house, rather than admit to using them. President Reagan, as stated by J. Green, was often viewed as making policy based mainly on his ideology, polled obsessively, taking polls “prior to his inauguration, while he was being inaugurated, and the day after he was inaugurated.”

Informationalized Nations Versus Industrialized Nations

The progress of human civilization, as explained by A. Toffler, includes three periodical phenomena: agriculturalization, industrialization, and informationalization. Apart from a few tiny, agrarian tribal populations in the world, the agriculturalization era, which was mostly seen between 8000 B.C.E. and 1750 C.E., has been totally exhausted.

However, the industrialization process, which has revolutionized life in many parts of the world for the last three centuries, is still in effect due to the fact that, as the economic growth of many countries continues, some are at their early stages of industrialization, and they are in pursuit of industrialization like the United States, United Kingdom, France, Germany, and Japan. Informationalization has begun with the technologic and scientific revolution of the post-World War II era. This period is also known as the space age, information age, electronic era, or global village, thus indicating the shift from the industrialization process toward informationalization.

Informationalization is the new technological paradigm of the 21st century, to the point where Kerric Harvey argues that a nation's level of informationalization is now more economically, politically, and culturally significant than its relative degree of industrialization. Contrary to the material-based production of industrialization dating back to the 19th and 20th centuries, informationalization refers to the production of immaterial goods.

There has been recent development in information and communication technologies, such as computers, mobile devices, and the Internet, which can contribute to the rapid flow of money and information. These technological revolutions have eroded physical boundaries in politics, economics, and other aspects of world affairs. Therefore, there is a technological change from the conventional notion of industrialization to the involvement of information, knowledge, and communication in production and marketing industries.

In this respect, there are two aspects of the debate, respectively, as the cases altering the industrialization process and the cases challenging the industrialization process, which seem more salient while explaining the dilemma between the informationalized nations and industrialized nations.

Information-Based Cases Altering the Industrialization Process

In accordance with the Schumpeterian perspective emphasizing the importance of innovation, firms and states profit when they innovate. One can claim that using information technologies in industries is of utmost importance. For example, J. A. Cantwell argues that Asian countries, such as Japan and Korea, entered global competition later than the United States; however, they concentrated on innovation more than the United States.

Instrumentation, which is designed for scientific purposes, has a broad range of applications within industrial technologies. As suggested by N. Rosenberg, instrumentation and techniques have shifted from one scientific field to another. There have been interactions among different areas of science. The electron microscope (EM) and nuclear magnetic resonance (NMR) can be given as examples for scientific instrumentation that have been transferred from one field to another. The EM was first designed to examine atomic structure, but it later became a useful instrument in medical research. In the same vein, NMR was first designed to measure the magnetic moments of atomic nuclei, but it was later used in analytical chemistry and biology.

The semiconductor industry is hardly unique in its experience of transferring research instrumentation, as opposed to transferring knowledge derived from research, from the university laboratory to the factory level. For example, ion implantation was first designed for high-energy particle physics by academic scientists, but it was later used as an alternative deposition technique in the semiconductor industry. In the same way, the scanning electron microscope has become an important measurement tool in the production of microelectronic elements because of its higher zoom capability, which cannot be obtained by optical microscopes.

Similarly, the invention of the laser resulted in a beginning of basic research in the fields of optics

for the purpose of using lasers in fiber optic transmission. The invention of the transistor in 1947 can be considered one of the most prominent milestones in microelectronics, thereby leading to the production of the first personal computer in the 1980s. Therefore, one can claim that science and information retain dynamic features, thus giving an impetus for transferring and diversifying industries.

There have been crucial changes for many other industrial products as well. For example, today's automobiles are manufactured with data information and communication units that can mediate their basic functions, including acceleration, braking, and steering. In terms of industry on household appliances, a new washing machine has a microcomputer with controlling and information systems, instead of the mechanical ones of the 1980s and 1990s. Moreover, a primitive 1990s cell phone, which was capable of making only basic phone calls, later transformed into smartphones comprising navigation, wireless data communication (Edge, 3G, LTE, bluetooth and Wi-Fi), digital cameras, digital compasses, accelerometers, and light sensor units. With the inclusion of new features, smartphone usage has dramatically increased.

Along with advances in communication technologies, the information revolution boomed especially in late 1990s because of the rising number of personal computers and Internet usage. Increasing speed and mobility of wireless communication networks such as 3G, LTE, and Wi-Fi further accelerated the use of the Internet around the world. Therefore, the Internet has had the lion's share of marketing and purchasing in the world for the last two decades. Thus, advances in information technologies have led to the occurrence of a highly developed, informationalized society, and it has also contributed to the emergence of alternative marketing and purchasing industries.

Information-Based Cases Challenging the Industrialization Process

Informationalized nations have challenged industrialized nations over environmental issues. The dilemma between industrialization and the promotion of environmental protection in accordance with scientific information has hitherto

become a matter of debate. Thus, the 1992 Earth Summit also drew attention to this issue and highlighted the link between environmental problems and economic development. There are two core arguments as to whether industrialization is positive for the environment or not.

Proponents of industrialization argue that economic growth and wealth contribute to fund environmental protection needs, to develop higher environmental standards, and to adapt environmental technology used for the protection and prevention of environmental problems. However, opponents of free trade have concerns about the preservation of nature due to the impact of industrialization policies. They argue that industrial activities will lead to increased pollution (as a result of overconsumption and transportation) and the extravagant use of resources. In addition to these concerns, countries' reluctance to sign environmental agreements because of their industrial policies will inevitably result in environmental problems.

The information-based conflicts around environmental issues take place in two specific areas, respectively, known as ozone layer depletion and climate change.

The Depletion of the Ozone Layer

The ozone layer plays a critical role in protecting human life on Earth by absorbing harmful ultraviolet radiation from the sun. In 1974, two American scientists suggested that the ozone layer was being depleted by anthropogenic chemicals, notably chlorofluorocarbons (CFCs). In 1977, the United Nations Environment Programme (UNEP) organized a conference attended mostly by scientists from 32 countries, and the output of the conference was a world plan of action aiming to coordinate future research on ozone layer depletion.

However, all these efforts did not create a significant result until a hole in the ozone layer was discovered above Antarctica in 1985. In 1988, scientists from around the world reached a consensus that CFCs and other synthetic chemicals were the primary cause for ozone layer depletion, and this fact was declared in the Ozone Trends Panel in 1988.

Meanwhile, in 1977, the United States, Canada, Norway, Sweden, and Finland (subsequently

known as the Toronto Group) pushed the UNEP for remedial action. Members of the European Community, which accounted for 45 percent of the world's CFC production, strongly resisted such an action. The Toronto Group proposed a complete ban of nonessential production and usage of CFCs, while the European Community advocated only limiting production. The UNEP's endeavors led to an international convention in Vienna in 1985.

Two years later, the resistance of the European Community and Japan was removed, and the Montreal Protocol was signed in September 1987, aiming to reduce CFC production by 50 percent of 1986 levels by 1999 and freeze halon production at 1986 levels by 1992. This was a success for the UNEP because the states had signed the protocol without any firm scientific evidence that proved the causality between ozone layer depletion and CFC production. Several months after the Montreal Protocol was signed, scientists proposed scientific evidence that linked CFC production and ozone layer depletion at the Ozone Trends Panel at the beginning of 1988.

Industrialized countries were responsible for almost 90 percent of CFC consumption, although they represented only 25 percent of the world's population. Therefore, it seems that the environmental regime on ozone layer depletion was successful. However, there are new problems that have occurred in the last two decades. Emerging global economic players like China, India, and Brazil consume ozone-depleting substances in refrigeration and air-conditioning systems that will increase with further industrialization. They may ask incentives from developed countries in order to develop substitutes to replace CFC and halon. Developed countries' resistance would jeopardize the future of the protocol.

Climate Change

Besides ozone layer depletion, the other striking environmental problem that the world faces is related to climate change. Climate change engrosses not only the scientific community, but also policymakers. In the international arena, there have been some initiatives to draw attention to this problem. Scientific conferences, panels, protocols, and global institutions all played roles in addressing the climate change phenomenon.

Therefore, it can be claimed that implementing policies in accordance with the findings of the scientific community has become crucial.

For example, the 1997 Kyoto Protocol, which reinforces the United Nations Framework Convention on Climate Change, commits developed countries to reducing their collective emissions of six key greenhouse gases (GHGs) by at least 5 percent below 1990 levels from 2008 to 2012. Furthermore, the Climate Change Conference, which was held in Denmark, offers a framework for the alleviation of climate change beyond 2012. However, what is apparent is that the climate change is still on the agenda, and its main provisions wait to be collectively adopted.

Some countries are reluctant to agree with the provisions of the Kyoto Protocol because of the fact that it leads to the creation of ecotaxes that would provoke public hostility. On the other hand, provisions on reducing gas emissions would influence powerful energy producers and car manufacturers.

Moreover, enacting legislation on climate change can trigger energy lobbyists and split them in accordance to their industrial interests. According to J. Broder and J. Mouawad, producers of natural gas are battling with the oil companies. Electrical companies are fighting over the use of coal and emphasizing wind power or other renewable energy resources. Coal companies are combatting against natural gas firms.

Therefore, climate change is vitally important, and there is a need to take precautionary measures before it causes unsolvable problems. However, today's individual states are not willing to adopt and implement internationally acknowledged scientific provisions on climate change due to their own industrial interests.

Conclusion

One can argue that there has been a rapid flow of information, thus giving way to the development of new technologies and diversifying industries with information-based ones. However, information technologies do not always go well with industries. Nations adherent to the principles of scientific information can challenge nations making profits from conventional industries.

Informationalized nations defy industrialized nations through diverse industrial activities and

their scientific standpoints in dealing with environmental problems, which emerged as a result of industrial activities. Henceforth, informationized nations will be on the agenda of the world politics for some time due to the fact that they will continue to shape industrial and environmental policies and challenge nations dependent on conventional industries.

Innocence of Muslims, The

The Innocence of Muslims is a trailer for a film, supposedly about the life of Muhammad, which appeared on YouTube in July 2012. It was posted by a man using the alias Sam Bacile, and turned out to have been produced by Nakoula Basseley Nakoula, an Egyptian Copt living in the United States. It came to prominence in September of that same year, after it was dubbed into Arabic and shared among anti-Muslim communities, eventually coming to the attention of Egyptian television station Al-Nas, where it was presented as a popular American film that denigrated the Prophet of Islam. The true notoriety associated with this short 14-minute clip occurred when protests against the film broke out on September 11, 2012. Aside from the associations of the date with the 9/11 terrorist attacks on the United States, these protests were significant because they occurred in a variety of Arab Spring states, including Egypt, and were initially, erroneously, tied to the attack on the U.S. Consulate in Benghazi, Libya.

The Innocence of Muslims and its producer are indicative of a couple of much wider social media trends. Many people claim that there has been a significant rise in Islamophobia since the 9/11 attacks, and that the Internet provides a means for people to vent hatred or prejudice against Muslims with relatively little fear of reprisal. Alternatively, the methods used to generate interest in the film and the likely motives behind its distribution could be seen as an example of online "trolls" at work.

Film Content

The claims of Islamophobia in regard to this film are based largely on its themes. In the space of only 14 minutes, the film makes a rather large number of points about the character and actions of Muhammad and their relationship to Islam as a whole, nearly all of which would be deeply offensive to the general public, and especially to Muslims. Muhammad as a man is depicted as a hybrid of domineering master and effeminate vacillator. As master, he marries various women, some of them forcefully, and is depicted forcing sex upon them and upon their slaves or women he has conquered in battle. There are also mentions of him marrying a child and approving of his troops sexually abusing children from conquered territories. As the indecisive, effeminate prophet, Muhammad's angelic visions are linked to placing his head between a woman's thighs.

He is shown being especially dependent upon the support of Kadijah and submissive to her. Another scene shows his men discussing him and asking whether he is gay. This is followed up by a further question of whether he is dominant or submissive in these acts, to which a resounding answer of "both" is given. Still other scenes show Muhammad interacting with non-Muslims. These involve him demanding conversion or payment of "extortion" money, which is a reference to the traditional tax on non-Muslim monotheists called the *jizya*. Refusal to obey leads to declarations of war, murdering men in front of their wives before mutilating their corpses, and admonitions to give up all their goods and flee.

Apart from these depictions of Muhammad, the short film also makes a host of claims about Islam. The opening of the clip involves the destruction of a Christian library or church by Muslim mobs while police stand by and watch. Then, Christians are shown discussing how they have been tortured and forced to confess to crimes against their people that they did not commit. At several points, it shows Muhammad or Muslim soldiers referring to the Koran and calling it perfect and gracious and holy, but always after making claims regarding the sexual liberties or killing that it allows. It is also depicted as having been written by someone else entirely, who states outright that it will be a mixture of Jewish scripture and the New Testament, but done in a way to look somehow

new. The portrait painted of both Muhammad and Islam is meant to provoke a reaction because it touches upon things that are generally considered taboo in Islam, such as depicting an image of Muhammad, pedophilia, homosexuality, and questioning the origin and validity of the Koran.

The pattern of provocation is not only seen in the material in the clip, but also in the actors who ensured its distribution, including Florida pastor Terry Jones, who is famous for such things as wanting to host an International Burn the Koran Day. In the world of online social media, this practice is known as "trolling," and those who go about provoking reactions are called "trolls." These individuals promoted this YouTube clip from utter obscurity to center stage in an international protest movement. In the past, there were plenty of people with strong and even hateful views who would publish their beliefs. However, distribution required access to significant amounts of money or influence because publishing was expensive and often subject to state control.

Presently, though states often still attempt to regulate speech and media, they are generally rendered unable to comprehensively prohibit material because there are countless people committed to ensuring that they can slip information past firewalls and other technological barriers. Trolls are even harder to control because much of their work is simply done by sharing offensive links or statements in the comments section of articles or Web sites that are commonly accessed, and which often bear no relationship to the topic of their hatred. Once the material enters the mainstream, links are quickly replicated and shared, and it is nearly impossible to stop the spread of information.

Political Ramifications

The Innocence of Muslims is a case study of social threat posed by the potent combination of hate speech, easy access to distribution channels, the lack of context and accountability on upload sites, and the actions of provocateurs who seek to create social unrest or reactions. In this case, not only the film's maker and its promoters are responsible for stoking reactions, but also the inaccurate representation of the clip on Egyptian television as a proper film with some level of U.S. government approval or involvement. It has been argued that conflating protests expressing displeasure at

Protesters on September 20, 2012, in Sydney, Australia, display their anger about the controversial film *The Innocence of Muslims*. The film trailer was supposedly about the Prophet Muhammad.

the film with attacks by terror groups on the U.S. Consulate and CIA facility in Benghazi, Libya, made the film even more notorious. These attacks led to the first killing of a U.S. ambassador in decades, J. Christopher Stevens, ambassador to Libya, and three other embassy staff.

Further muddying the waters was the timing of the events in the last stages of the U.S. presidential election. In an effort to prohibit a rush to judgment and to encourage calm, President Obama's ambassador to the United Nations, Susan Rice, subsequently appeared on several political talk shows, and suggested that the attacks in Libya

were spontaneous protests in response to the film. It soon came to light that this was not the case, and the Obama administration was accused, chiefly although not exclusively by its conservative opponents, of downplaying a terror attack for political reasons, a politically charged accusation. Given that these accusations reached their zenith in the contested period just prior to the 2012 presidential election, there has been some commentary regarding possible over-playing of the incident by conservatives for strategic purposes. There has been an ongoing series of hearings about the sequence of events in Benghazi, and much of the focus remains on the press releases and public statements regarding the supposed connection to *The Innocence of Muslims*.

The confluence of events that led to *The Innocence of Muslims* going from a nearly invisible YouTube clip to the spark of violent international protests and political scandal at the highest level of U.S. politics is unprecedented. To a certain degree, the volatility of social media because of its ability to quickly go viral and the ease with which information can be completely misrepresented is unsurprising.

The explosive nature of these events was further stoked by the way in which the clip played into stereotypes of Muslims as uncivilized, violent, and overly sexualized, while confirming the suspicions of some in the Middle East that the West is anti-Muslim and morally degenerate. The fallout from this incident is known to have included not just protests, but also deaths, and political ramifications for the U.S. government are yet to be determined. At the very least, the inability of governments to restrict potentially inflammatory material and the tension between free and responsible speech were brought into stark relief by this incident.

Innovation and Technology

The technology of social media depends on mechanisms that allow users to contribute content. In this way, as described by Tim O’Reilly, companies no longer offer products for consumers to buy, but platforms for users to exchange information. The incredible proliferation of social media technologies since 2000 is, in large part, from the shared set of resources that they can use to create their services. Many of the technologies behind social media were developed for other purposes, and almost all social media depend on infrastructures that they did not create (such as the World Wide Web and cell phone networks), so the innovation of social media companies is as much in how to harness the efforts of users for a social media platform as they are to develop new techniques for enabling public participation.

It could be argued that computer technology was social after the introduction of time-sharing computers in the 1960s. This method of sharing access to centralized mainframe computers meant that users were no longer in competition for scarce resources, and were encouraged to support each other by leaving files in common storage areas for other users, a practice that would be developed into e-mail. The development of the ARPANet encouraged users to share information between dispersed geographic locations, and researchers developed several conventions for group communication that are familiar today. Michael Hart, at the University of Illinois Material Research Lab, desiring to pay back the expensive computing resources he was given for free, decided to make the full text of the U.S. Declaration of Independence available to users of the network on July 4, 1971. This was the first e-text of a collection that

would later become known as Project Gutenberg. ARPA leadership demanded that users of the network communicate electronically, leading to the development of protocols that allowed users to collaborate in groups.

USENET, or what was sometimes called the “poor person’s ARPANet,” was developed in 1979, based on a protocol for communication between Unix mainframes. USENET relied on periodic connections between mainframes, usually over telephone lines, to distribute messages. The first connections were to support computer users between Duke Medical School, Duke University, and the University of North Carolina at Chapel Hill. Because any user could create a group to foster a conversation between individuals with a mutual interest, USENET communities quickly grew. The network was helped by Bell Labs’ sponsorship of a cross-country link in the early days of the network. Michael Hauben, an early USENET user and an eloquent spokesperson for its potential, coined the term “netizen” to refer to the new medium that was controlled by its audience.

Outside the United States, a French service known as Minitel brought many online services to the wider public, demonstrating how users would embrace this kind of service. First demonstrated in 1980 and available for users in 1983, Minitel was a small household terminal developed to replace the paper phone book, and promised to provide businesses with commercial listings. Soon, additional services were added: library catalogs, transportation schedules and ticketing, USENET information, e-mail, chat, and newspapers. One of the most used (and most infamous) services was Minitel Rose, an online sex chat that in peak periods of usage threatened to overwhelm the system.

In the United States, bulletin board systems (BBSs) allowed users to dial into a mainframe computer and share messages (and sometimes chat or explore virtual worlds) with other users. The first of these were available in the late 1970s, but one of the best known of these was the Well, created when Stewart Brand brought his Whole Earth Catalog online. This service was first profitable in 1987, and had a user base of 2,000. Other consumer dialup services were available at this time; Compuserp, which had begun in 1969

as a subsidiary of Golden United Life Insurance, was spun off as a separate service in 1975, and allowed users access to e-mail and other online services. Steve Case, who had been inspired by connecting to computer users all over the country, started a service in 1985 that would become America Online (AOL).

A mechanism to bring these different services together through one interface was developed by Tim Berners-Lee in the early 1990s. Berners-Lee developed the hypertext transfer protocol (HTTP) so that applications like his WorldWideWeb could share pages that were formatted according to the hypertext markup language (HTML), which standardized the way that information was stored. Although the first Web browsers, software to access the World Wide Web, were available in 1992, search engines were not yet in use. Some users, in an effort to be helpful, created lists of interesting and useful Web sites that they discovered. These Web logs came to be known as blogs.

Using HTML, many different types of documents were easily made available, but the interactive capabilities of the Web (however rudimentary) allowed for input from users. In 1994, Ward Cunningham developed software to allow computer programmers to share their research using interactive Web pages as part of the Portland Pattern Repository. Based in part on hypertext applications that were readily available for single users, Cunningham's insight was to deploy a distributed hypertext that was available over the Web that users could quickly and easily edit. He made the software available on his personal Web site in 1995, calling it WikiWikiWeb, a conceptualization of Tim Berners-Lee's application WorldWideWeb, "wiki" being a Hawai'ian word for "fast." His software allowed his community to quickly collaborate.

The browser wars of the 1990s, where competing companies gave away browser software to access the Web and earned money by selling proprietary services, led to browsers with features that helped companies enrich their online presence. One of the protocols was known as real simple syndication (RSS). The idea behind RSS was that instead of expecting customers to visit a Web site—what was known as a "pull"—it would be better to "push" information out to those who might be interested. RSS allowed companies to

push short notifications to potential customers who had subscribed to their RSS feeds. By subscribing, the notifications would show up in the user's Web browser when he or she started the application. This idea was borrowed by Facebook and other services that encourage users to sign back often to see updates from friends, colleagues, or companies that interested them.

Rise of Social Media

One of the first platforms to take advantage of the insight that users would donate their time and expertise to a project that would serve a social need was Wikipedia. Other encyclopedias had begun to appear online, but these were based on publishing enterprises and an expert-based mode of creating content. In January 2001, the organizers of a project to generate a free encyclopedia, Nupedia, went online with the intention of rapidly iterating the drafting, review, and publishing process. Although Nupedia had only created a dozen articles, in a few months, Wikipedia had over 8,000; after its first year of operation, there were more than 20,000. The first international Wikipedias appeared that same year, even though about 90 percent of the first Wikipedia articles were written in English.

The technical infrastructure for Wikipedia is remarkably simple to use. Based on Ward Cunningham's WikiWikiWeb concept, users can quickly begin editing the text of encyclopedia entries without knowing anything about Web programming or database management. Instead, users may edit pages with intuitive tags that the platform then converts into styles and links. In this way, the power and the flexibility of the World Wide Web ensure that a wide variety of users have access to the pages of the encyclopedia, while the WikiWikiWeb conventions allow users with varying degrees of computing expertise to participate in the creation of pages.

However, deciding to use this flexible, intuitive platform was not the main contribution of Wikipedia. Giving users the capability to create and edit pages does not in itself generate a usable resource. From the beginning, the encyclopedia announced clear guidelines for its users on what the expectations of the overall project were. For instance, the convention of the "neutral point of view" for articles was announced in the first year, requiring

that users do not present articles from a partisan position, but instead consider how different people will consider the topic. The international community involved in the project has taken this policy in interesting directions: for instance, the objectivity of the article on the launch of Sputnik in 1957 was questioned because it referred to the “Sputnik scare.” Although this is a typical way of thinking of the aftermath of the launch, when Americans were concerned that they were falling behind in the quest for space, readers pointed out that this phrase only applied to people within the United States.

In 2003, when the encyclopedia contained more than 100,000 pages, the basic structure of the arbitration system was codified. A number of trusted users were given administrative privileges, allowing them to resolve conflicts regarding the encyclopedia, and a dispute policy was announced that explained what would happen when different users of the site disagreed about its contents. These developments helped develop the project because contributors made the editorial policies of the site transparent, but they had another important effect. By distributing the authority for maintaining the platform, much in the same way that AOL and other content providers had done in the previous generation of services, Wikipedia ensured that devoted users had a stake in the project. In this way, the most motivated and respected contributors to the encyclopedia were awarded for their contributions, giving them the sensation of pride that encouraged them to continue working on the project. Other awards and roles were developed that continued to respect the contributions of Wikipedia users.

China blocked Wikipedia in 2004 several times, and continued to block the site periodically in following years. In 2005, when there were more than 750,000 English pages alone, Wikipedia and other social media began to appear in the mainstream media. The article about John Seigenthaler, a journalist, was vandalized to accuse him of conspiracy in the Kennedy assassinations. The incorrect information was not detected for months. In addition to harnessing the creative power of their users, another way that social media technologies profit from their customers is by mobilizing information about them; as described by Tim O'Reilly, the key to a Web 2.0 company is to collect data

on what users do, and then profit from it. The one company that has maximized the use of data generated by users is Google. Steven Levy has documented the rise of Google from its humble origins in a Stanford University dorm room to a multinational corporation, explaining along the way how Google has studied what its users do and has used that information to innovate new ways of helping them to do it better.

For instance, in order to improve search results, Google studied what users were looking for and identified which terms were likely to be searched together. The word *bio*, Levy points out, could mean “biography” or “biological.” By studying which other words go along with the search, Google can understand the difference: When *Gandhi* is in the search box, the word must mean “biography”; but when *warfare* is in the search box, the word must mean “biological.” Similarly, Google has used typing errors to help improve search results. By noticing what corrections users make in successive searches (e.g., looking first for *enterpenurial*, and then *entrepreneurial*), Google can help bypass user error and direct them to what they are looking for sooner.

User information is also helpful in creating some of Google's key products, such as advertising. While other search engines had sold preferred placement in search results, Google decided early on that it wanted to provide a reliable service for its competitors. Instead, the company decided that it would sell advertising space based on what its customers were looking for and interested in. Google's AdWords service allows companies to bid on specific words, tying their advertisement to a selected number of times that a word appears in search results. This allowed smaller companies to gain access to Google's customers; in television advertising, in contrast, only the largest corporations have access to the most profitable consumers.

Criticisms of Social Media Technology

Social media have provided meaningful ways for users to collaborate, share, and access information in ways that go beyond the resources that any single company could have developed by paying employees. These services, however, are not without their critics. Privacy drives many of the concerns from users. Although Wikipedia

and other services can be credited for providing a usable mechanism for large numbers of people to donate their time, this means that many people are working without compensation. Trebor Scholz edited a volume titled *Digital Labor* about concerns over possible exploitation because users contribute their creative effort to social media, and companies use that content to turn a profit. These critics consider whether the contributions from netizens, who have made many billion dollar companies, are so different from *Harry Potter* or *Star Trek* fans, who add to the depth of media corporations' holdings.

Another issue is what has come to be known as content that is developed according to “geek priorities.” Although social media have been used to develop what seem to be comprehensive resources for the study of culture, society, and even history, the development has been directed by the interests of users who tend to be white, male, in younger demographics, and American. As Roy Rosenzweig

has pointed out, what is possible to find on Wikipedia is slanted. One critic pointed out that the article on Hurricane Francis is five times as long as the one on Chinese art. This is not to say that resources developed by traditional media are free from this kind of bias; some scholars have argued that encyclopedias and scholarly work in general are always conditioned by an unconscious pressure toward what the creators think is the most important. In order to address topics that have been underrepresented on Wikipedia, some groups have organized editing brigades, such as the March 2013 Feminists Engage Wikipedia.

Given the way that international protest movements have relied on social media to organize themselves, social media has been criticized by human rights organizations because their policies, geared toward an American audience, do not consider their responsibilities toward people in other countries. For instance, Facebook's policy that individuals and not groups may create their pages—and the policy that users have only one account and use their legal names—is inhibiting to those who wish to use Facebook to organize. As documented in *Access Controlled*, for instance, YouTube's prohibition of violence in user contributions has led to documentary evidence about police brutality to be deleted by savvy regimes that seek to remain in power. It might be too much to ask organizations to respect the human rights of individuals when they make their policies, but it could also be said that companies that seek to profit from social media technology have a responsibility to those who use it in contexts outside of the United States.

Inouye, Dan

Daniel "Dan" Ken Inouye was, until December 2012, Hawai'i's senior U.S. senator. A lifelong member of the Democratic Party, his service as president pro tempore of the Senate made him the Asian American with the highest rank in the history of American politics in 2012, and third in line of succession to the presidency after the vice president. Until his death in December 2012, Inouye served the Committee on Appropriations of the U.S. Senate as chair.

Military Career and Education

Dan Inouye witnessed the attack on Pearl Harbor in 1941, where he was a medical volunteer. The U.S. Army ended the ban on Japanese American soldiers in 1943, prompting Inouye to postpone his educational plans and enrollment at the University of Hawai'i, where he was a premedical student, and enlist in the Army. He was a volunteer member of the Nisei 442nd Regimental Combat Team, a unit almost entirely comprised of Japanese Americans. In his first year of military service, Inouye attained the rank of sergeant and led his platoon. His regiment served abroad in Italy and France starting in 1944, and he was promoted to second lieutenant for his two-week stint in battle, attempting to relieve the surrounded Lost Battalion. He was shot in the chest during these weeks, but was saved by two silver dollars he had in his shirt pocket.

In April 1945, Inouye was seriously wounded in Italy as he led his platoon. Shot in the stomach, he proceeded to attack, and even refused treatment in favor of rallying his troops to destroy a second enemy gunning position. He personally advanced to within 10 yards of his next target, and as he had with the first, destroyed it using grenades and his machine gun. At that point, his right arm was severed at the elbow and left him next to his own primed grenade; he called back his own troops in case he lost control of his severed arm, removed the grenade from his right hand, and threw it at his target with his left hand. He managed one last burst of fire before he was wounded again, this time in the leg, collapsing from blood loss and shock. Inouye endured the amputation of the remainder of his right arm without proper anesthesia. In the hospital, Inouye met and became friends with Bob Dole, also a patient. The two maintained their friendship after that time.

Despite these trials, Inouye remained in the military until 1947, and left with the rank of captain. He was honorably discharged with the Bronze Star, two Purple Hearts, the Distinguished Service Cross, and 12 other citations. The Distinguished Service Cross was upgraded to the Medal of Honor in 2000 by President Clinton, alongside 19 other Nisei veterans; these men were initially believed to have been denied proper recognition based on their race.

In 2000, the emperor of Japan awarded the Grand Cordon of the Order of the Rising Sun to Inouye for his career in public service. In 2006, the U.S. Navy Memorial bestowed the Naval Heritage Award on Inouye in recognition of his support of the U.S. Navy and his military service. In 2007, French President Nicolas Sarkozy inducted Inouye as a Chevalier of the Legion of Honor as a living veteran of World War II who had served on French soil. In 2011, in honor of his work on behalf of Japanese and American goodwill, Inouye received the highest Japanese honor available to a foreigner not a head of state: the Grand Cordon of the Order of the Paulownia Flowers. He was the seventh American to receive the honor, and the first Japanese American to do so.

Forced by his disability to change intended career—he had originally planned to be a surgeon—Inouye returned to the University of

Hawai'i using the GI Bill and studied political science. He graduated in 1950 with his bachelor of arts degree and went on to earn his juris doctorate from Washington, D.C.'s George Washington Law School in 1953.

Political Career

Senator Inouye first ran for office in 1954. That year, he was elected to join Hawai'i's Territorial House of Representatives and selected to be the Democratic majority leader. In 1958, he joined the Territorial Senate on the eve of statehood for Hawai'i. When Hawai'i was granted statehood in 1959, Inouye was elected to represent Hawai'i in the U.S. House of Representatives and served there until 1962; that year, he went to the Senate, and until his death in late 2012, he remained there, serving his ninth term in a row. Inouye was the first Japanese American elected to the U.S. House of Representatives and the U.S. Senate.

Inouye was the keynote speaker in Chicago at 1968's tumultuous Democratic National Convention. In the 1970s, Inouye was a member of the Watergate Committee, and this investigatory role was reprised many times in his political career. Inouye was the chair of the Select Committee on Intelligence from 1975 until 1979. In the 1980s, Inouye was the Senate Democratic Central America Study Group chair and the National Bipartisan Commission on Central America's senior counselor.

Inouye was perhaps most well known for his role as the Iran–Contra Committee chair. It was during the exchange with Lt. Colonel Oliver North that he referred to the Nuremberg trials with counsel for North taking great umbrage to the reference. His service during the Iran–Contra affair gave rise to his now-famous description of the “secret government”;

There exists a shadowy Government with its own Air Force, its own Navy, its own fund-raising mechanism, and the ability to pursue its own ideas of the national interest, free from all checks and balances, and free from the law itself.

In 2009, Inouye replaced Robert Byrd as chair of the Appropriations Committee, where he remained until his death in December 2012.

He also served on the Defense Appropriations Subcommittee within the Senate until his death. At the time of his passing, Inouye was also the Commerce, Science & Transportation Committee's ranking Democrat, and he was on the Indian Affairs Committee. Inouye also served on the Rules Committee at the time of his death.

If Inouye had remained in office until June 29, 2014, he would have been the United States's longest-serving senator in history; instead, he was the second-longest after Robert Byrd. Inouye announced in 2012 that he intended to campaign for a 10th Senate term in 2016, a record number of terms; at that point, he would have been 92 years old. Senator Inouye entered the hospital on December 5, 2012, needing his oxygen intake monitored, and remained there until he died on December 17, 2012, of respiratory issues.

Social Media Use

Senator Inouye had a Starscore of 43,279 as of December 2012. He was number 53,171 on the Global Social Media Chart on December 13, 2012. Inouye's Media Power Rank was 51 of 541 on that same date. As of December 2012, he enjoyed almost 5,400 YouTube views, more than 5,500 Facebook fans, and more than 8,300 Twitter followers.

At least one opponent, Republican Cam Cavasso, saw Inouye's social media presence as a weak point for attack at election time. Cavasso's primary strategy in the 2010 election was to launch a social media-based campaign. Cavasso used Facebook, Flickr, Foursquare, and Twitter to attempt to reach younger and more technophilic votes. Ultimately, this proved unsuccessful as Inouye won with almost 75 percent of the vote.

Instagram

Instagram is a popular social networking platform that allows users to share digital photographs. The service was created by Kevin Systrom and Mike Krieger in October 2010, and was sold to Facebook Inc. in April 2012. Political candidates and political organizations use the application to connect with various relevant audiences, perhaps the most important of which is voters. Instagram was founded in San Francisco, California, when Kevin Systrom began work on an application that aimed to combine the best characteristics of other popular social networking applications such as Mafia Wars and Foursquare. The original application was called Burbn, but the name was later changed to Instagram when Mike Krieger joined the project and the upstart began focusing exclusively on

A collection of Instagram photos showing four different types of filters and varied borders. The Instagram site rapidly grew from 1 million users in December 2010 to 100 million by April 2012.

photo sharing. The name was designed to reference the idea that Instagram is a form of instant telegram service.

Instagram's mobile applications lets users upload and share photographs on the Instagram network and on other social networking sites such as Twitter, Facebook, Tumblr, Flickr, and Foursquare. All photos uploaded to the Internet via Instagram are converted to a standardized square shape. Users are also given the option of applying a filter to the image that transforms the photograph's appearance. Many of the filters alter the lighting and tone of an image so that it looks dated. Available filters include Amaro, Mayfair, Rise, Hudson, Valencia, X-Pro II, Sierra, Willow, Lo-Fi, Earlybird, Sutro, Toaster, Brannan, Inkwell, Walden, Hefe, Nashville, 1977, and Kelvin. However, many users still choose to upload a photo in normal mode, without a filter. Users also have the option of adding a border to their photograph. In addition to posting their photographs, Instagram users can browse others' photographs, comment on them, and "like" them. Users can "follow" their friends and their favorite Instagram users. Images can be organized via hashtags so that content is more searchable. Photo maps

organize images according to the geographical location where they were taken. Competing platforms such as Hipstamatic, Camera+, and Tadaa, offer many of the same photo-sharing and photo-filtering features as Instagram, but are not as popular.

Instagram officially launched on October 6, 2010. By December of the same year, they had over 1 million registered users. By April 2012, the site boasted over 100 million users. Because Instagram has always been free to users, and because the company was initially reluctant to incorporate paid advertising into its site, Instagram's popularity did not translate into immediate financial success. However, the upstart's founders and financial supporters reaped financial rewards when Facebook Inc. bought Instagram for an estimated \$1 billion in cash and stock in April 2012. When the deal was finalized in September 2012, the actual price tag was closer to \$741 million. In December 2012, Instagram incurred the ire of many users because it amended its terms of service. Specifically, a new clause gave Instagram permission to use users' likeness, photos, and other information in Instagram's commercials and other promotional materials, without any compensation to the Instagram user. Other critics noted that the agreement expanded Instagram's ability to collect and share personal information about users with potential advertisers. Instagram has since backtracked on many of the proposed changes to the user agreement.

Political Use

Just like other social networking tools, Instagram has been put to use by political candidates and political organizations. In the 2012 U.S. presidential campaign, both major party candidates, Democrat Barack Obama and Republican Mitt Romney, operated Instagram accounts. In addition to images of candidates speaking at campaign rallies, meeting political supporters, and spending time with their families, these accounts often featured candidates in more candid, behind-the-scenes situations. Barack Obama's Instagram account also encouraged supporters to use the hashtag #Obama2012 to share their political images with the campaign. The praise that Instagram has received as a political communication tool has tended to focus on how it provides

politicians with a concise, direct method of sharing their message and enhancing their image, and how it helps citizens feel personally connected to government and its leaders.

Elected officials have come to rely on Instagram for documenting their activities. For instance, New York City Mayor Michael Bloomberg's office used Instagram to document Hurricane Sandy relief efforts. Former Newark Mayor Cory Booker used Instagram to share his experience when he volunteered to live on food stamps for a week. The Independent Voter Network, an organization dedicated to encouraging political discourse through new media, listed Representative Kevin McCarthy (R-CA), President Barack Obama, Senator Elizabeth Warren (D-MA), Representative Steny Hoyer (D-MD), and Representative John Boehner (R-OH) as the top five politicians on Instagram. Political news organizations such as CNN, as well as political think tanks such as the Heritage Foundation, also maintain Instagram accounts.

Instagram may be more useful for helping politicians and political organizations connect with citizens who already support them, than for converting people to new political positions. Users may only see the images from users (in this instance, politicians) who they have already agreed to follow. Therefore, Instagram may be more useful for reinforcing views about politics and politicians than changing those views. In addition to political actors' use of Instagram to influence audiences, the *Pittsburgh Post-Gazette* has noted that many citizens used Instagram to document and share their Election Day experiences in 2012. The popular hashtag "#vote" aided in this process. Prevalent themes among Election Day images included pictures of citizens' "I Voted" stickers, pictures of voters' individual ballots, and pictures of the lines at polling places.

Instant Messengers, IRC, and ICQ

Instant Messengers (IM), Internet Relay Chat (IRC), and ICQ are all protocols or software clients enabling online chat. As predecessors to social media platforms, these forms of Internet communication enable users to engage in real-time, text-based discussions. IRC is the Internet's first chat network, developed in 1988 in response to the popularity of online discussions on Bulletin Board Systems (BBSs) in the 1970s and 1980s. BBSs only allowed asynchronous communication.

Blossoming in the 1990s, the IRC network currently still operates from more than 2,000 servers worldwide, and the top 100 networks serve 500,000 people at any given time, according to Netsplit. IRC, accessible through clients or Internet browsers, enables real-time conversations. IRC is mostly collective, taking place in channels. Invisible to fellow users, one-to-one exchanges are also possible in private mode.

Political Role of IRC

Little attention is given to how IRC was used for political purposes among citizens, similar to contemporary social media applications. IRC is a historical predecessor of today's use of Twitter, Facebook, and YouTube for airing dissident voices (e.g., by Occupy or Arab Spring protesters). When Communist Party hard-liners sought to overthrow the Soviet government led by pro-reform president Mikhail Gorbachev during the Soviet coup d'état attempt (August 19 to 21, 1991), IRC played a key role in circulating information within the Soviet Union and beyond. A media blackout affected traditional media and communication networks, including newspapers, TV, radio, and telephone. However, RELCOM (one of the Soviet Union's first Internet service

providers [ISPs]) was not censored, allowing alternative information to be circulated among the Soviet people and the outside world, which in turn assisted Gorbachev to regain authority. Similarly, IRC was used to circulate bottom-up citizen perspectives on events such as the 1992 U.S. presidential election, the 1995 Oklahoma City bombing, Gulf War events, and the 1994 earthquake in California, according to Ibiblio. Besides political and everyday use, IRC is known to be used for terrorist recruitment, criminal activities, and the dissemination of pirated and illicit sexual materials through private messages. By virtue of its decentralized workings, the intelligence community has difficulties in proactively monitoring all chat sessions. Furthermore, IRC chat is prone to hacker attacks, because exchanges are often collective and unencrypted, and activity typically spans long time periods.

ICQ

ICQ was the first IM client, launched in 1996 by the Israeli company Mirabilis. IM is a social media technology that allows users to privately exchange written messages in real time. Users can add people to their personal lists of contacts. Besides one-on-one communication, one-to-many communication consists of the broadcasting of personalized screen names to the audience of fellow users added to the contact list. In 1998, ICQ was acquired by the America Online (AOL), and in April 2010, it was bought by the Moscow-based investment group Digital Sky Technologies (DST).

The client has fallen out of fashion among users in the United States, but its popularity continues across eastern Europe and Russia (with 50 million active users in 2010). The transfer of servers to Russia that resulted from the latest transaction is feared to hinder U.S. law enforcement monitoring and investigations of user activities. Furthermore, the Russian Federal Security Service has achieved a greater stronghold over ICQ activities because it has rightful access to user data in the event of suspected security threats. Unlike other IM clients, on ICQ, only a five-digit unified identification number is permanent; other details such as personal information, display name, and contact details can be altered without having to reregister. This feature allows users great influence over their

privacy; great anonymity simultaneously provides increased opportunity for malevolent use.

Other Instant Messengers

Other prominent IM clients are Windows Live Messenger (formerly Microsoft Messenger, or MSN) with an active user base of 330 million in 2009, Apple's iMessage with 140 million active users in 2012, AOL Instant Messenger (AOL) that dominated the U.S. market but diminished to 4 million active users in 2012, and the Chinese Tencent QQ with an estimated 440 million active users in 2011. Recent additions to IM are the inclusion of voice and video chat and casual games.

IM remains relatively understudied because data gathering within this private space is not straightforward; users control who they let into their networks, and exchanges are not stored in a publicly accessible environment online, but mostly on the computers of users. On the level of identity politics of everyday use, it should be noted that text-based digital interaction was initially celebrated by scholars for its theoretical potential for sustaining disembodied identity, including gender, race, and looks. Separated from the offline physical world, IRC, IM, and ICQ, by virtue of their disembodiment, would be equalizing, democratizing, and empowering. Recent scholarship has, however, proven that offline power relations also pervade online written interaction.

Institute for Public Diplomacy and Global Communication

The Institute for Public Diplomacy and Global Communication (IPDGC) at George Washington University (GWU) examines public diplomacy on a global scale in the 21st century. IPDGC is a new vehicle for public diplomacy to connect with foreign publics. By combining the power of social media with leading U.S. and global political figures, the institute has established itself as a center to both inform and influence the global dialogue. As the institute's director Sean Aday notes, the lines between public diplomacy and diplomacy and that of the people and those in power are now blurred.

Established in 2001, the institute lies within the School of Media and Public Affairs of the Columbian College of Arts and Science, and the Elliot School of International Affairs, in collaboration with the University's Public Diplomacy Council. It is part of the university's global communication master's program and is led by Sean Aday. Aday joined the university's School of Media and Public Affairs in 2000, and focuses his work on the intersection of the press, politics, and public opinion.

The institute has five primary core focus areas: new media, security, and public diplomacy; the role of women and gender in security, communication, and diplomacy; 21st-century U.S. foreign policy priorities, such as China, Iran, and Africa; "whole of government," interagency challenges, particularly in the areas of public diplomacy and strategic communication; and global perspectives and approaches to public diplomacy.

It studies how fast information moves, how people connect with one another, and the impact of mass communications. Through conferences, panels, research talks, and workshops, the institute seeks to advance public diplomacy through scholarship, research, consultation, and professional services.

IPDGC has welcomed leading scholars, leaders, practitioners, and undersecretaries of state through its doors, and has offered training for nongovernmental organizations and embassies. Diplomatic officials from around the globe have

visited the institute to connect and discuss pressing and topical issues with students.

Dr. Abdul Hakim Asher is the director of the Government Media and Information Centre for the Islamic Republic of Afghanistan. Dr. Asher visited George Washington University as a visiting scholar in 2012 through May 2013 to work on a book, participate in events at the School of Media and Public Affairs, and connect with scholars and students.

In November 2011, the institute welcomed two delegates from the People's Republic of China. The delegates, scholars from IPDGC, lawyers, and former and current government officials held discussions on the strengths and challenges of the American political structure, public affairs, and Internet policy.

Social Media Presence

The media play a critical role in public diplomacy in influencing opinion and thought. IPDGC leverages the power of the media through means such as Twitter, YouTube, and Facebook. In this manner, global conversations are driven by users, and feedback on the dialogue is instant.

IPDGC has a YouTube channel to share its lectures and conferences. In March 2012, the institute hosted a symposium, *Hip Hop Diplomacy: Connecting Through Culture*, to discuss cultural diplomacy in an intriguing and interesting manner. As Aday notes at the event, the Obama administration brought about a revolution in public diplomacy because it focuses just as much on the people as those in power. Mass communications play a large role in how the United States presents itself and how diverse audiences and stakeholders behave.

The IPDGC Twitter account, @IPDGC, presents itself as a hub for state affairs, new media, and important domestic and international news. The institute also features a blog, *Take Five*, which seeks to invigorate the public diplomacy discussion with contributions from a wide range of authors offering fresh ideas about the way that America conducts its diplomatic relations abroad and about the impact of current policies.

Many of IPDGC's events aim to analyze the role of social media in current affairs. In one event, which partnered with the U.S. Institute of Peace, a panel of journalists and political leaders discussed the role of new media, technology, and

the Syrian crisis. Throughout the day, discussions were held on how user-generated images, videos, and stories stream in every day from the nation of Syria, documenting the country's instability. The group provided analysis and insight into the influence of new media in the crisis, specifically on three types of actors: activists on the ground, journalists and media-makers who are reporting on the crisis, and policymakers around the world.

On December 3, 2012, the institute hosted an event on the Role of Social Media in Ending Violence Against Women. The crux of the discussion, which included social media strategists and women advocates, was how social media offers unprecedented opportunities to raise awareness around violence against women and girls, to help users stay safe, and to inspire people to engage in social activism. Simultaneously, social media blur the lines between journalism and activism.

Institution for Social and Policy Studies

The Institution for Social and Policy Studies (ISPS) was founded at Yale in 1968. Its aims are to foster

interdisciplinary social science research, and its outputs draw upon scholarship from several different faculties. The organization's tagline is: "Advancing Research, Shaping Policy, Developing Leaders." These functions are served through hosting academic conferences on a wide variety of social science topics, funding and publishing original research, hosting academics from the postgraduate to the professorial level engaged in interdisciplinary work, advocating specific policy positions that reflect its prodemocracy and proacademic values, participating in public policy debates, and offering degree programs for undergraduate students.

Areas of Study

The ISPS has 25 recognized areas of study in its research and publication remit. Of these, at least four have direct relevance to social media and politics. These include: civil society and the state, governance and democratic process, political behavior, and science and technology.

The vast majority of its publications and research in these fields is in the form of academic journal articles, with a significant number of book chapters, and the occasional academic monograph. Many of these articles are published in the most prestigious journals, demonstrating not only the publishing success, but also the intellectual rigor and innovation involved in its work. In particular, the institution has a reputation for excellence in field experimentation, which is a method of research that involves the use of randomized variables introduced into personal or institutional political processes, which can then be studied for their effects. Studies of this type have assessed the role of constitutional education in generating support for civil rights and tax policy. Many eminent political thinkers and social activists have participated in the institution's events, including open information and technology advocate Lawrence Lessig.

The ISPS has three semi-autonomous study or research centers under its umbrella, in addition to its other projects. These are the Center for the Study of American Politics (CSAP), the Program in Agrarian Studies, and the Interdisciplinary Center for Bioethics. The center is heavily engaged in the U.S. political science community, and frequently hosts conferences, seminars,

roundtables, and visiting scholars on topics related to American politics. Its more unique offerings include short courses for faculty of other departments, which aim to give advanced specialist training and knowledge on particular special interests. The staff structure of ISPS reflects its interdisciplinary focus. Its current director, James Hacker, is a professor of political science. Other members of the leadership include professors from sociology, psychology, law, economics and management, and health policy and administration.

Advocacy

The ISPS could be characterized as generally progressive in its policy recommendations and advocacy activities. Much of this advocacy simply takes the form of convening experts in various fields to discuss political topics and making the proceedings available to the public through a variety of social media platforms. Examples of recent topics have included gun violence and gun control, the role of money and power in gaining a political voice, climate change and pressure on scientists to keep their findings quiet, and the idea that scholarship/scholars should take political positions and be politically engaged.

The political engagement of scholars can be problematic for an academic discipline such as political science, which purports at least a degree of objectivity by inclusion of the word *science*. There have been issues with government funding of political research, especially when that research is used to advocate positions that are not in agreement with the governing party or parties that appropriate the funds.

The ISPS was part of an effort to lobby the U.S. Congress to continue funding political science research through the National Science Foundation, but this effort failed, with politicians acknowledging that they objected to the type of research and its implications. The institution has been particularly forceful in advocating for open access to research and academic publications as part of its commitment to creating a better-informed voting public and citizenry.

This commitment is evidenced not only in its statements and research outputs, but also in the availability of its research database, which allows open access to view primary source

datasets, published papers, and journal articles, and even book chapters from its various scholars. Given that it has to negotiate numerous copyright obstacles in order to allow this level of access, this demonstrates a genuine commitment to the open access to information cause. Much of this information will remain practically inaccessible to the general public because of its academic language and specialization; however, the center also makes lectures and roundtable discussions from its functions available online for public viewing.

Social Media

In order to disseminate its work as widely as possible and to fulfill its role as an advocacy organization, the institution maintains a presence on several of the major social networking and media platforms. It has a Facebook page, and is especially active on Twitter. Its tweets link to articles and videos, and frequently refers to political hot topics using hashtags.

This allows its research to quickly enter the mainstream political discourse. It also has a YouTube channel with over 30,000 subscribers and a library of roughly 20 videos. The International Political Science Association lists its Web site as among the most important political science Web sites in the world. Through the medium of eBooks and hardcopy books, the institution also publishes a book series, showcasing the work of its scholars, often offering assessments of public policy and prescriptions for making it work better.

Institutional Cabling

As the Internet and other technological advances have become more reliable and common in schools, nonprofit organizations, hospitals, and other institutions, social media have become an area of interest, especially with regard to the extent that they allow the creation and exchange of user-created content. To permit such a change, however, institutions must have the infrastructure, such as cabling or wireless technologies, that permit the use of Web- or mobile-based technologies to foster such communication. Infrastructure improvement has been a keen concern of these leading institutions, although even wealthy organizations have sometimes found the cost of installing cabling or wireless access to be prohibitively expensive. This is perhaps related to a colloquial understanding of the term *institutional cabling*, in which those industry sectors perceived to have both the need for a new technology and the means to pay for it are likely to be at the top of the installation and diffusion list. A variety of public and government-sponsored initiatives, however, had greatly assisted with this endeavor.

Although discussions regarding social media commonly refer to the Internet, in reality, an extensive range of information services and resources are used to connect millions of private, public, commercial, institutional, and government networks. These information services and resources include the World Wide Web, which consists of a series of interlinked hypertext documents accessed by means of the Internet, as well as the infrastructure necessary to support this information transfer. Sometimes referred to as information infrastructure, it is comprised of facilities, people, processes, and technology that are used to create, use, transport, and store information. During the 1990s, information infrastructure first came to the public's attention as a result of a political initiative by Vice President Al Gore to assist nonprofit institutions, especially schools, to install the cabling necessary to connect to the Internet.

In 1991, then-Senator Al Gore introduced what became known as the High-Performance Computing Act (HPCA). Although the HPCA had a variety of goals, the creation of a National Information Infrastructure and the funding of the

National Research and Education Network had important ramifications for institutions seeking to create the high-speed computer networks necessary to efficiently access the Internet. This information superhighway would permit the development of digital communication systems that ultimately led to the creation and advancement of social media tools common today.

Building upon developments begun by the military during the 1960s, and refined for educational and commercial use with funding from the National Science Foundation (NSF) during the 1980s, HPCA sought to bring the use of the Internet to the general public. To this end, HPCA helped to fund the National Center for Supercomputing Applications (NCSA) at the University of Illinois at Champaign/Urbana. Work at NCSA led to the development of Mosaic in 1993, an early Web browser that helped to spur the Internet boom because of its use of a graphical user interface (GUI) and reliable and easily understood experience. While the HPCA provided funding for the cabling of schools, the attention this drew also led to state, local, and municipal governments funding this initiative, as well as volunteer initiatives designed to ensure that all students had access to the Internet.

In 1995, the chief science officer at Sun Microsystems, John Gage, established NetDay as a way for high-tech companies and organizations to assist clinics, libraries, and schools in connecting to the Internet. The first official NetDay, held on March 9, 1996, received a great deal of publicity because of the participation of President Bill Clinton and Vice President Gore, along with 20,000 other volunteers. Clinton and Gore spent NetDay 1996 at Ygnacio Valley High School in Concord, California, as part of an initiative to install cable in 20 percent of California schools so that they would be able to connect to the Internet. NetDay continued to be an annual event through 2004, with the program eventually merging into Project Tomorrow, another initiative that seeks to encourage and improve science and mathematics education.

Evolving technology has changed the materials used for institutional cabling. In the early 1990s, short coaxial cables were commonly used for implementing Ethernet networks, which is the standard for local area networks (LANs).

As technology advanced, however, fiberoptic and twisted pair cables came to be favored for use in wiring institutions. As wireless local area networks have grown in popularity, many institutions have experimented with switching to a Wi-Fi system that allows electronic devices to exchange data using radio waves over a computer network. Wi-Fi can be used by many devices, including personal computers, tablets, smartphones, and digital audio players. The switch to Wi-Fi requires the installation of access points, sometimes called hotspots, every 65 feet within a structure. As the price of this technology declines, it seems likely to continue to replace traditional cabling in institutions.

Interactive Advertising Bureau

The Interactive Advertising Bureau (IAB) is an organization founded in the United States in 1996, with the primary objective of encouraging investment in interactive advertising, and thus in digital media. This supranational organization has two main divisions in the United States and Europe that looks for specific purposes in their operation areas. The North American division of the IAB is composed of more than 500 telecommunication companies and media that account for 86 percent

of the country's interactive advertising investment. Its headquarters is located in New York City, and it has a public policy office in Washington, D.C. The power of this association lies in its members, including: general members, companies with turnover that is significantly based on the sale of interactive advertising inventory; associate members, companies that support the sale of interactive advertising inventory but are not qualified to be in the previous membership; and long tail members, composed of independent sites and corporations that act as publishers (selling indirectly, through a network, or directly) and have incomes above \$1 million a year.

The current president and CEO of the American division of the IAB is Randall Rothenberg. He was elected president in 2007, and served as such until 2010, when he left the office to join Time Inc. as executive vice president and chief digital officer. Later in 2011, he was rehired by the IAB as president and CEO. Before working for the IAB, Rothenberg worked for 10 years as marketing and media columnist for *Advertising Age*. Then, he worked for six years for the *New York Times* as technology editor and politics editor of the Sunday magazine, daily advertising columnist, and media and marketing reporter. Prior to his IAB role, Mr. Rothenberg was the senior director of intellectual capital of Booz Allen Hamilton, the international strategy and technology consulting firm.

Members

IAB Europe represents more than 5,500 organizations from 27 countries across the continent. IAB Europe includes not only the mature markets of western Europe, but also countries such as Russia, Macedonia, Croatia, and Slovakia. Members fall into two main categories, corporate and national. The 54 corporate members include "a variety of European, Russian and American companies acting in Europe throughout different digital platforms, technologies and disciplines." Their role within the organization is supporting expertise and funding so that the association can achieve its objectives.

The association also brings together 27 national members that conduct regional studies about advertising investment in interactive media. They are responsible for developing ethical codes for the sector and to unify audience measurement

systems in the network. Lack of standardization is the major barrier to advertisers. The 27 European countries that have headquarters of the IAB are: Portugal, Spain, the United Kingdom, Ireland, Germany, Austria, Belgium, Bulgaria, Croatia, Denmark, Slovakia, Slovenia, Finland, France, Greece, Holland, Hungary, Italy, Luxembourg, Norway, Poland, the Czech Republic, Romania, Serbia, Switzerland, Sweden, and the Ukraine.

Goals

The Internet is so far the only medium that combines three key channel capabilities in marketing: communication, transaction and distribution; and the vertical integration of marketing communications, including advertising, public relations, promotion, and direct marketing. In the early days of Internet advertising, editors of traditional mass media feared a loss of investment to online media. This did not happen, and the launch has been very slow, mainly because of the lack of standards for audience measurement, which is one of the reasons why the IAB was created. According to its statutes, the fundamental objective of the IAB is to promote interactive advertising, supporting its members to improve their position on the market.

The main goals of both divisions are: establish guidelines for audience measurement in digital media and promote standards to unify the market; share best practices that result in business growth; and generate research regarding this area, demonstrating the growth of the online industry. IAB Europe publishes the following reports: Adex Benchmark, the definitive guide to the European online ad market, covering 25 country clubs in 2012; Mediascope Europe, the industry standard, an average European consumption study; Regional Reports, including EEC, the Nordic countries, the Middle East, and the big seven markets in Europe; and Consumer Benefit Study, calculating the value of the free Internet, the economic value of the digital industry highlighting the digital creation of employment and trade for the regions, and protection against adverse legislation and regulation, which can influence the development of this market.

To achieve these goals, the IAB proposed establishing a system of councils and committees specialized thematically, and through its work, created added value to members. Committees are

advertising, platform-based groups open to all members of the IAB. Councils are based on job role or industry initiative, and are open only to members of the IAB General. Associate members may be invited to councils on a case-by-case basis. Both councils and committees are agenda-setting groups of senior executives. They spin off working groups made up of subject matter experts from member companies to focus on personal projects.

Interactive Documentary

Interactive documentary is a term used to describe the new possibilities for both the construction and representation of reality brought about by the human–computer interface. For a documentary to be interactive in this context, a physical action needs to take place between the human and the computer. This physical action can include many different types of interactivity, such as mouse clicking through Web sites, tapping on multitouch tablet screens, activating sensors in gallery installations, and using smartphones to call up locative media. As computers become ever more embedded into everyday life, the possibilities of interactive documentary continue to evolve, with the understanding of

these possibilities. Interactive documentary has a strong link to the theme of politics and social media because it can help facilitate participation by breaking down boundaries between producers, audiences, and documentary subjects.

Early examples of interactive documentary presented multimedia recordings organized as a closed database of clips that the user could explore via a hyperlink interface. An example of this was *Moss Landing*, produced by the Apple Multimedia Lab in 1989, which used multiple cameras to record the life of the inhabitants of Moss Landing over the period of one day. This logic of hypertext documentary was subsequently applied to pioneering work produced by the Voyager Company, such as the Stravinsky's Rite of Spring CD-ROM and BBC Interactive Television, such as the Domesday Videodisc Project. These works tended to focus on the point-and-click style of navigation that was prevalent at the time, through which users could take multiple routes through an organized database of recordings.

By the mid-1990s, it had become evident that this approach to interactive documentary was failing to deliver an immersive experience for the user, and the suggestion was made that more subtle forms of interaction based on simulation and spatial metaphor held much greater promise for the future. The term *interactive documentary* fell largely dormant, and the focus shifted away from representation toward the development of networked computing. However, by 2005, high-speed broadband had enabled a new form of convergence, bringing together computing, television, and the telecommunications industry. This led to a renaissance of the term *interactive documentary* and a flurry of activity. While networked computing has been key to these developments, it is not the sole driver. Other factors, such as the development of more immersive interfaces and an increasing desire to combine documentary recordings with live performance, are also at play.

In 2011, i-Docs was convened as the world's first conference dedicated to interactive documentary. Taking an expansive view of interactive documentary, the conference incorporated possibilities afforded by a wide range of technologies, and placed debates around intent and purpose at the center of the discussions. A follow-up conference was convened in 2012, and the i-Docs.org

Web hub was set up for ongoing discussion and debate. Central to the endeavor was the idea to engage a community of practitioners and theorists in open-ended dialogue driven by a spirit of collaboration and exchange. Discussion around the politics of participation and associated ethical issues continues to be an important theme within this developing community. Interactive documentary making has subsequently become more recognized within the mainstream documentary circuit, as can be seen by its increased exposure at festivals and conferences around the world.

Current debates around interactive documentary are focused on different approaches to authorship within a fluid and interdisciplinary field of practice. The creators of these new forms may be professional storytellers communicating expert knowledge, artists communicating personal visions, or activists working to engage disenfranchised communities in an active process of making. By 2011, the current focus for interactive documentary making was in countries such as Canada and France, where there is a long-standing tradition of government subsidy for such endeavors. However, interactive documentaries are becoming ever more global in their reach. Projects such as *18 Days in Egypt* have crowdsourced peoples' recordings of the events leading up to the 2011 uprising, and the database of documentary recordings from the Indian subcontinent found on the Pad.ma Web site has grown exponentially. *18 Days in Egypt*, in particular, is a good example of the multiple ways in which interactive documentary as a new media storytelling genre can—and often does—not just incorporate, but often capitalize on social media as a source of content nontraditional distribution strategies.

The interactive documentary holds the potential to facilitate political engagement by encouraging users to become participants in the active construction of a reality. This potential is playing out in a variety of contexts, from requiring participants to make active decisions through role-play and simulation, through increasing people's access to government information, to empowering people to create interactive documentaries in response to the world around them. Remix culture is also a key factor in the world of interactive documentary because recordings can be

downloaded and repurposed to create new interpretations. In addition to this, the open source community is actively developing free software to facilitate access to interactive documentary making. This participatory promise must not be taken as a given. As interactive documentary making becomes ever-more mainstream, viable business models are emerging. This brings well-rehearsed debates around access and ownership to the fore, placing the genre within a much broader continuum of practice.

International Examples of Political Parties and Social Media

Social media offer much to democracy and political engagement; therefore, much research has been devoted to examining how political parties and candidates use these platforms. Political parties are arguably the lifeblood of democracies. Traditionally, political parties form around a set

of ideological values and precepts. Recent trends have seen many parties shedding their ideological constraints to instead offer a manifesto of policies that appeal to a postideological electorate. These have been described as catch-all parties, designed to appeal to the largest number of voters possible. Within this postideological context, electioneering becomes more about positioning the party elite and leader as the best management team than selling a value-laden perspective of society. Political parties perform a number of functions within democracies. First, parties provide representation for individuals and groups. Second, they provide mechanisms for political socialization through meetings, social clubs, and societies and encourage participation by mobilizing their members. Third, they articulate the interests of those they represent and aggregate those interests to formulate policy. Fourth, they provide leadership to form governments or coalitions; power is dispersed among the elite and across the membership who elect the leader.

The Potential of Social Media

Theoretically, the first three functions of political parties may be supported through the use of social media. The demand for responsive representation necessitates greater emphasis on communication. Mass media are increasingly unlikely to provide space for parties to inform citizens about their representative activities. Web sites have, for over a decade, been spaces for unmediated information from political parties; however, longitudinal studies by the U.S.-based Pew Research Center, the United Kingdom (UK) Hansard Society, and the French Mediapolis Project show that no more than 12 percent of people visit party Web sites. Weblogs, microblogs, the use of Twitter or Facebook as news feeds, or picture or video sharing platforms offer more engaging ways of reaching citizens. Furthermore, due to platform functionality permitting content sharing, social media use can extend the reach of the party beyond their immediate followers, via those followers to a broader online diaspora. Informing remains a core element of political parties' communication; however, the second and third functions may be best served using social media.

Social media facilitate the creation of communities that connect around shared interests.

These demonstrators gathered outside BBC Television in London to protest the network's invitation to the leader of a neofascist party to a television interview. Opponents of the British National Party also attacked the party on its Facebook page.

Political parties can use social media platforms to create spaces for members, activists, supporters, and those with a general interest in the policies or fortunes of the party to congregate virtually. The act of joining gives the party permission to contact individuals within that community, therefore enhancing the informational link.

However, and more importantly, parties are also able to mobilize their supporters to extend the reach of their messages, support their campaigns using e-petitions, for example, and engage in some form of offline activism. But, political party use of social media need not stop at building a community of members that will work for the party; the party can also work with members of the community. Social media can be used to solicit the views of community members, gaining data regarding policy priorities and cocreate policy. These activities evoke a somewhat optimistic view of how political parties may use social media.

Social Political Parties?

Political parties were initially slow to incorporate social media into their communication strategies. The U.S. campaigns of Jesse Ventura in 1998, the innovative use of Weblogs and Meetup.org by Howard Dean in 2003 and 2004, and Barack Obama's 2008 campaign showed the potential the Internet offered for building and mobilizing a grassroots movement. The use of the MyBO site to build a community, mobilize supporters online and offline, and, in a limited way cocreate policy priorities following his victory, led to his tactics being mirrored in elections across the world, from Portugal to Israel and the UK. However, take up of social media mostly just mirrored the look of the Obama campaign, rather than replicating the social strategy in its entirety.

Studies of elections in advanced democracies where a critical mass of citizens has access to the Internet show that the majority of parties create profiles on the most popular social media platforms in their respective countries. The global dominance of YouTube, Twitter, and Facebook has seen them equally dominate the sphere of political communication. YouTube plays the role of a personal television channel, allowing parties to place their videos online for continual viewing; this is particularly useful in nations where political advertising is not permitted by law. Twitter plays the role of a news feed, transmitting information, often including links to the party Web site or its YouTube channel. Facebook is largely used for a similar function. A Facebook feed is often linked to Twitter, but with scope for embedding pictures and videos. These social media platforms are often complemented by multimedia Web sites that offer news feeds allowing visitors to leave comments. These uses of social media all support the representative function of political parties by providing spaces where information can be delivered directly to interested supporters and the wider citizenry. The byproduct of this usage, even when it is not always the intention, is to facilitate a more interactive mode of political communication.

The use of Facebook in particular, by default, creates a community to whom the party can communicate, and that can communicate back to the party. The community is also able to communicate with one another, discussing any aspect of the party's communication or political program.

However, parties remain absent from conversations that take place. Parties do not encourage discussion by asking questions or requesting content cocreation. They do not respond publicly to questions asked by community members (e.g., YouTube channels comments are disabled to prevent the party message from becoming distorted).

What appears within the political party profiles on social media platforms is a form of graffiti. Visitors place comments and slogans on the walls of social media profiles of the parties that require no response, and the graffiti writer does not return to check for responses. The majority of this graffiti is supportive. The Facebook profiles of parties during election campaigns in the UK, Poland, and France largely had favorable comments from supporters happy to publicly advertise their support. However, opponents also use these spaces to attack parties. The UK Labour Party launched a campaign called Change We See, asking supporters to upload pictures demonstrating what the Labour governments from 1997 to 2010 had achieved. One activist uploaded pictures depicting urban decay to subvert the campaign.

A blunter example saw Facebook users become fans of the British National Party, a right-wing neofascist organization, long enough to post comments such as "fascist scum." However, political parties universally encourage one form of interaction, activities that extend the reach of the party. Hence, social media is seen as a tool for political parties to promote themselves, using the free labor of supporters, as opposed to a space for communities to work with parties to develop policy.

Promotion is not the only use made of the Internet, and so, social media spaces that permit interaction but are not public need to be considered. The German Christian Democratic Union and Social Democratic Party created private spaces within StudiVZ, which could only be accessed by approved members. More common, however, is to have a social space within a party Intranet system. Here, debate can take place to determine policy, but this is open only to party members. Party strategists argue that if parties were to open up decision making, then it would undermine two key principles that underpin the principles on which parties operate. First, political parties should sell solutions, not simply

follow public opinion, retaining the role for values and utilitarianism. Second, parties with an internal democratic structure must involve members in policymaking, not the broader citizenry. Hence, the use of social media is limited; public communication is allowed, but interaction is designed to mobilize supporters into activism, not to contribute to policymaking. Political communication on social media largely adheres to the norms of persuasion.

The Challenge of Reach

The assumption was that social media provided the means to reach young people, those least likely to be interested in party politics, to engage with elections or vote. While young people are among those who follow parties on social media, according to surveys, the majority are 30 years old or older and have an existing high interest in politics. These data suggest that the only way for social media to fulfill the potential to gain support among new demographics relies on network effect, that online supporters of the political party share messages with their networks, facilitating messages to reach those who would perhaps never consider seeking political information online.

Social media usage, however, not only facilitates reaching new demographics, but also delivering information to individuals and groups who may extend the reach of a party by dint of their professions and interests. This group includes party activists, but more importantly, journalists, issue activists, and Webloggers. Party use of Twitter, for example, seems far more likely to be targeted at journalists. But, parties have the problem that they are unsure what voice to use on social media. Corporate brands can build a following using special offers. Individual politicians, presidential candidates, party leaders, or local representatives can present a more engaging experience for followers by using a mixture of political and personal insights. Local representatives can also address specific local issues that are of interest to their constituents. Political parties are unable to personalize their communication, have no products to entice supporters, and can offer little beyond a news feed.

Social media offer one further opportunity for political parties: the collection of data. A

significant amount of data can be gleaned about party supporters from platforms like Facebook. Insights into their interests, the causes they support, their occupations, education levels, and other personal details can be learned and then used for targeting further communication. However, resources determine whether data mining can be effectively conducted.

Caution and Cost: Barriers to Usage

Two issues constrain political parties embracing social media, beyond those raised relating to wider issues of external and internal democracy. First are those relating to loss of control. Because of the practices of trolling, control over communication can be lost.

Criticism on social media is likely to be public and so becomes part of the overall online presence of the party. Furthermore, parties can be drawn into in-depth discussion about policy that they ordinarily avoid. Particularly in the context of elections, but also possibly when the opposition develops critiques of government policy, parties tend to eschew specifics in favor of broader political statements.

Second, there are practical reasons that social media are not used to their full potential by political parties: finances. To effectively manage a social media presence requires personnel to create content, answer questions, and moderate comments; resources are also required to effectively use data that can be gleaned from social media. Few parties outside of the United States have the resources for these demands; hence, social media tend to be used for promotional purposes only.

International Intervention

Interventions are intentional actions taken by an actor from one state in the affairs of another. Historically, intervention has been viewed as state actions in the domestic affairs of other states. Today, augmented by social media, non-state actors are also able to effect interventions across state borders. In countries where domestic political conflicts have potential international consequences, or where domestic factions are supported or opposed from the outside, various types of intervention can occur.

Electronic social media have provided new methods and channels for carrying out intervention. Social media are used to inject new information into political conflicts from outside a country's borders, and social networks can be deployed for political mobilization and opposition. Especially where political conflicts reach a crisis level, social media provide a critical instrument in foreign policy to influence the outcomes of domestic contests for political power.

Forms of Intervention

Intervention, as it applies to social media, can be viewed along a continuum of discrete actions of increasing escalation. In the social media context, interventions include official government-sponsored messaging, messaging by nongovernmental organizations (NGOs) outside and inside the country, messaging by political factions or opposition groups in the country for internal and external consumption, and individuals—wherever they are located—participating in a political contest. The messaging can be strategic, in terms of communicating objectives, threats, and intentions or tactical in terms of organizing particular events

or commenting upon developments in political crises.

Along this continuum, traditional diplomacy ranks at the base of the scale, where social media can best be used to communicate intentions from one government to another in a public setting. Social media have also played roles in revealing private, diplomatic communications that might benefit one faction or another. For example, the Tunisian uprisings beginning in December 2010 spawned a number of organizations, such as *tunileaks.org* and *OpenTunisia.org*, with their stated purpose to publicize diplomatic correspondence about the Zine al-Abidine Ben Ali regime, spreading their messages through social media networks.

Public diplomacy and advocacy follow traditional diplomacy in using social media to communicate intentions, demands, and support directly to affected groups, bypassing official governmental channels. Communicating intentions from one government directly to people in another country has the objective of countering, reinforcing, or contradicting messages by adversaries. Messages that condemn provocative or violent actions or expose human rights violations, for example, can be linked from press releases on official Web sites to social media services, and thus have a large, ready audience receiving such messages simultaneously.

During the Egyptian conflicts of January 2011, social media sites were extensively used to obtain real-time changes in support for the Mubarak regime in other countries. Likewise, running commentaries on official policy statements can be aggregated and used as an indicator of support or opposition. Knowing this fact, the security agencies in Egypt for a time injected individual messages of alleged support for Mubarak as a way of tempering opposition and perhaps to confound foreign social media analyses.

Novel ways to sustain intervention occurred during Iran's Green Revolution following presidential elections in 2009. Internal groups organized around the defeated political parties in ways that amplified their influence through social media, and they soon had support from Iranian diaspora groups and other sympathizers. The momentum and size of these groups grew and began to use social media effectively for both organization and tactical mobilization in the streets of Iran's major

cities. To sustain pressure on the Iranian government, U.S. authorities persuaded Twitter to defer maintenance on its site so that Iranians could continue to use the service. When the Iranian government began to block social media sites, individuals outside Iran provided methods for circumventing such censorship, and continued to monitor Iranian networks for signs of interference. While one of these circumvention tools was later proven ineffective, rapid, real-time actions from outside Iran were able to assist social networks inside the country actively and were able to get information in and out of the country, overcoming Iranian government interference. Thus, both governments and organized groups can monitor the activities of opposition groups during a political conflict and take measures to sustain and secure their activities or attempt to close them down.

Intervention can also extend to selective communications-related sanctions against one country by another or by a coalition of governments seeking to alter the dynamics of a political conflict. In the case of Syria, for example, in 2012, the United States and other sympathetic countries embargoed hardware and software that can block Web sites or enable surveillance of mobile texting and short messaging services (SMSs). At the same time, communications equipment, software, and training were made available to opposition groups by governments and private sources. This type of assistance has been used in social networks for warning the population in a given area of impending actions by the Syrian government and for better organizing groups inside Syria to report and document human rights abuses.

Intervention using social media also takes the form of covert actions and the use of proxy actors. Certain groups may not want to disclose the identity of their members for security reasons. Some groups and governments may desire to inject disinformation and rumor into a political conflict anonymously or in a false name. These uses of social media are only beginning to be understood because it is difficult to obtain systematic, reliable data about covert or clandestine media operations. Yet, when the stakes in a political crisis are high, and especially when such intervention promises to increase turmoil and disorder, incentives are strong to use social media to complicate the landscape or distract certain groups to their

disadvantage. It is also very difficult to determine the source of such actions because social media services cannot always prevent pseudonymous identities or messages. Attribution becomes obscure: Groups may claim credit through social media for certain actions, without any independent means of verification.

When intervention reaches the point of military action, social media can be employed to aid certain operations. In the July 2006 war between Israel and Hezbollah, incursions by Israeli forces or coordinated air strikes were preceded by SMSs and texting broadcast messages to thousands of Lebanese numbers. These broadcast text messages were effective in evacuating noncombatants from certain areas or compelling opposing forces to move, thereby disclosing their positions. Future conflicts

Local members of the International Committee of the Red Cross and Red Crescent unloading food with the help of city residents in the Al-Ghuta neighborhood of Homs, Syria, in February 2012.

can expect social media to play similar roles of warning and response. Opposing forces that want to restrict communications can also be expected to shut down or impede social media services of an adversary to gain operational advantage.

Norms of Intervention

International relations scholars generally agree that all forms of intervention have been increasing along the entire continuum in the past two decades and will likely continue. Yet, scholars disagree whether such evidence of intervention indicates an emerging norm in international behavior, and they disagree about the desirability of social media to play an increasingly significant role in international intervention. In normative terms, many forays in media freedom, the free flow of information, and similar concepts feed directly into arguments that promote human rights, democratic reform, and the development of healthy civil society. Yet, it remains to be demonstrated whether foreign intervention in a domestic political conflict can induce desired results or be controlled once ignited. Social media initially appear to be neutral or benign channels for distributing news, information, and for organizing political groups. Yet, its power for social mobilization appears strong. Once unleashed, these media may take on characteristics beyond the control of their initial source.

Even in a humanitarian response, social media may not always be used as intended by aid and relief agencies. Such observations should not be taken as arguments to curtail the value of social messaging in these situations. Yet, governments and nongovernmental organizations will need to understand that, when they intervene in a political conflict, their ability to control the outcomes of events may be more limited than desired. Conversely, the effects of social media in political conflicts show that information is power, and as such, political actors will seek to control and manipulate it for their ends whenever they are able.

International Online Communities

The Internet, by its boundary-crossing nature, has been able to support the development of a number of communities at an unprecedented international level. The definition of "community" is in itself a fluid concept, but for the purposes of this entry, it will involve an analysis of groups that come together online across a number of different

countries with a shared interest or aim. These communities can be facilitated through any form of online interaction, from video chat to bulletin boards, and can be open access or closed to a specific group. Furthermore, online communities can differ from real-world communities in that they can connect not only individuals, but also organizations working in relation to a common purpose or interest.

Research into real-world communities highlights the development and existence of norms of behavior, and while international online communities follow certain social structures, the use of technology has led to the development of new behavioral norms and methods of internal regulation. Whereas some communities, for example Virtual Sunderland in the United Kingdom, link to particular physical locations, a large number of online communities have developed at an international level.

Types

International online communities are difficult to categorize because of their differing origins, aims, and regulations. Some develop through a focus on entertainment and interactions relating to specific genres. Something Awful is a discussion-board Web site based upon the sharing of comedy-related content. Its pay-to-register forum has a large, international user base that has contributed to the development of a number of notable Internet memes. In a similar vein, IGN is an entertainment-focused community Web site that not only addresses video games, but also films and television programs. While most of the interaction focuses on entertainment, it also has active general discussion and community areas.

Certain international communities develop through an initial focus upon a particular interest or issue. Vault Network is a large, international community focused on roleplaying and massively multiplayer online role-playing games (MMORPGs). It includes a wiki and a very active forum, with a heavy emphasis on user-directed topic development. Buddy Pic has developed into an online community and had more than 74 million posts as of 2012; these often have a focus on rating users' photographs on the basis of their attractiveness. This is then underpinned by a number of forums, including general discussion topics. Gaia

Online initially developed as an anime-focused community site, but has significantly grown to encompass social networking and forum-based interactions. It had more than 26 million registered users in 2012, and developed currency, Gai-aCash, which can be gained as a reward for community participation. In a similar manner to Gai Online, 4Chan is a Web site that initially developed in order to discuss anime, but has grown into something much more all encompassing, and no issue is off limits. It has a focus on the posting of images and a policy of anonymous registration. Due to these policies and the grassroots development of community group standards, 4Chan users have created numerous Internet memes and are rumored to be at the center of high-profile instances of online activism and pranks.

The development of content is the key driver for the international online communities that have grown on a wiki basis. The first user-generated wiki site was WikiWikiWeb, which acts as an idea-sharing forum to bring people with shared interests together. Wikipedia is the largest wiki Web site, with approximately 365 million global users. It is a user-generated and edited online encyclopedia that supports a large, international community of contributors and interactions in order to achieve a consensus on the shared information. Its multilingual format supports the international nature of its community-building resources.

Certain online international communities encourage global interaction through immersion in virtual worlds. These allow users to interact with others through the online interaction of avatars. The international nature of these Web sites facilitate community development on a global scale, where users can find others with similar interests and share information using related chat, forums, and blogs. Second Life is an immersive online environment with more than 20 million registered users that allows those over the age of 16 to interact as avatars in a sophisticated virtual world.

International online communities can build up around the interactive features supporting commercial Web sites. EBay is a consumer-to-consumer Web site that allows users to list items for immediate or auction-based sale. Its attached community allows global users to use discussion boards and videos and to join groups. In a similar

manner, Amazon is a large e-commerce selling platform that includes community-building features, which allow registered users to rate and discuss products and to interact via its forums. The development of a virtual community attached to a commercial enterprise is a powerful way to expand online businesses. The community in which users can interact and support each other both attracts potential customers and aids the retention of existing ones.

Social Networking

Some of the largest international online communities have built up around social networking platforms. These will generally allow users a space upon which to post information and images; this is then complemented by chat facilities, games, and group spaces. Facebook is one of the largest social networking communities, and in 2012, its number of active users surpassed 1 billion. Another example of a social networking-based international community is Myspace, which developed with a focus on pop music and culture, but has recently seen a downturn in active unique users. Other similar platforms include Hi5, which has a large, international user base outside the United States; and LinkedIn, which seeks to create an international community of professional contacts.

International virtual communities have also been created in order to facilitate the sharing of research at a global level. The interaction provided through these communities allows for an unprecedented level of participation and collaboration across existing and new networks. The European Union's Lisbon Strategy includes a focus upon developing these online communities through initiatives such as GEANT and the e-Science Grids.

International Social Media and Politics

Social media began to emerge as a widespread tool for political change at the turn of the 21st century, alongside the development of the social Web. Globally, popular social media platforms such as Facebook, YouTube, and Twitter have had a strong impact on the development of tactics for online organizing, while local platforms often play significant roles in the delivery of local political messages. Older social media, such as short message service (SMS) play significant roles in organizing, particularly in countries where mobile penetration is higher than Internet penetration.

Among the earliest examples of social media use to influence politics occurred in 2001 in the Philippines, where upon a congressional vote to set aside key evidence against President Joseph Estrada in his impeachment trial, thousands of Filipinos quickly organized in protest, in part by forwarding a text message with instructions on where to meet and what to wear. Their protest was effective in changing legislators' minds: The evidence was allowed, and Estrada was sentenced.

Similarly, after Spanish Prime Minister José María Aznar inaccurately blamed the March 11, 2004, Madrid train bombings on Basque separatists, demonstrations organized by text messaging led to Aznar losing the elections several days later.

Researcher Michael McFaul has suggested that Ukraine's 2004 Orange Revolution "may have been the first in history to be organized largely online." Activists coordinated protests using SMS, while Web site discussion boards for reporting election fraud were quickly developed and

disseminated. Additionally, the relative increase in Internet access—3.5 percent of Ukrainians had access in 2004, compared to 1.25 percent in 2001—allowed for newly developed independent and citizen media to reach a larger constituency.

Social Media and Political Movements

The launch of dedicated social media platforms such as Facebook (2004), YouTube (2005), and Twitter (2006) greatly improved the ability of politicians, activists, and other organizers to communicate to the masses. Whereas blogs and other Web sites enable individuals and organizations to broadcast information, these platforms enable one-to-one communication, and coupled with the proliferation of smartphones, allow anyone to quickly distribute text, images, and video.

While these tools have had significant impacts on the structure of both political campaigns and grassroots political organizing, they have been slow—or, in some cases, have yet—to eclipse older social media such as SMS in countries where Internet penetration remains low. For example, unrest triggered in January 2008 by Kenya's contested presidential elections quickly turned to violence because of the viral spread of SMS urging violent retribution against the Kikuyu ethnic group.

This prompted the development of a tool to track incidents of violence by a group of Kenyans located in the country and throughout the diaspora. Dubbed Ushahidi, the tool blends the use of Google maps with a tool for users, via mobile phone or Internet browser, to report incidents of violence and add photos, video, and text documentation. Ushahidi, later developed and made publicly available as a tracking tool for political and humanitarian purposes, helped draw attention to Kenya's political unrest and later restore order to the country.

Although it also relied heavily on the use of SMS for organizing, Burma's 2007 Saffron Revolution was among the first political movements to utilize Web-based social media tools. Using mobile phones, Burmese citizens took pictures and videos that they then uploaded from Internet cafes or sent across the border to Thailand to be uploaded. Although it is impossible to determine the intent of such widespread action, with Internet penetration in Burma well below 1 percent at the

time, the effect was less of political change, and more toward ensuring that the world was watching. The government, nevertheless, responded by shutting down the country's Internet and mobile phone connections for nearly two weeks.

One year later what may be the first large-scale protest organized in part on Facebook occurred. In Al Mahalla al Kubra, Egypt, workers responding to low wages and rising food costs organized a general strike on April 6, 2008, just two days before municipal elections. Their strike was picked up and promoted on Facebook, blogs, SMS, and through word of mouth by activists. One Facebook group, dubbed the April 6 Youth Movement, attracted more than 64,000 members. As a result of the strike, several bloggers and online activists who participated in the calls to action were arrested. The 2008 movement is often cited as having contributed to the 2011 protests that ousted then-president Hosni Mubarak.

Facebook also featured prominently in what may have been the largest demonstration in Colombia's history. On February 4, 2008, more than a million Colombians—as well as smaller groups in dozens of major cities worldwide—took to the streets to demonstrate against the Revolutionary Armed Forces of Colombia (FARC). The call for demonstration originated with Oscar Morales, a young engineer who set up a Facebook group called One Million Voices Against the FARC in an effort to influence public sentiment during a period of hostage negotiations. Morales's Facebook efforts received considerable international attention, and may have influenced future use of the platform.

Twitter Revolutions

The use of Twitter in a political movement first came into play in April 2009 in Moldova, where more than 10,000 protesters were reported by the *New York Times* to have materialized, as Ellen Barry describes, from “seemingly out of nowhere.” Utilizing Twitter's format of 140 characters or fewer, activists used the hashtag #pman (short for Piata Marii Adunari Nationale, or the name of Moldovan capital Chisinau's main square) to encourage citizens to join the protests and report on events, leading scholar Evgeny Morozov to dub the protests a *Twitter revolution*, the first documented use of the term.

Although the Moldovan uprising failed as a revolution, it succeeded in drawing attention to the use of social media as a protest tool. Moldova's Internet penetration—about 30 percent of the population in 2009—may have hindered Twitter's role in organizing, but given the global popularity of Twitter at the time, its use greatly contributed to global awareness of the Moldovan protests, partly because of the ability of activists to hijack existing conversation threads on Twitter in an effort to increase international attention.

A second uprising in 2009 cemented Twitter's utility as a tool for political movements when, following Iran's contested presidential election, protesters took to the streets to protest Ahmadinejad's win and used Twitter to ensure that the world was watching. At the time of the protests, many news sources—including the *New York Times* and *TIME Magazine*—immediately dubbed the uprising a "Twitter revolution"; however others, including Evgeny Morozov, were skeptical, questioning the number of Iranians actually using Twitter within the country. Whereas thousands of tweets utilizing the #iranelection hashtag were documented, it is not clear how many of those missives came from within the country; discerning location was made more difficult by the fact that many Twitter users changed the location field of their user profiles to Tehran as an act of solidarity, obscuring their true locations. The perceived importance of Twitter was increased by a request from the U.S. Department of State on June 12 to Twitter to delay a network upgrade in order to ensure that Iranian protesters using the site could access it during the day.

YouTube also played a prominent role in the 2009 Iranian uprising after the death of a passerby, Neda Agha-Soltan, was recorded and uploaded to the site, turning Agha-Soltan's death into "probably the most widely witnessed death in human history," according to Krista Mahr. Although in the aftermath, the utility of Twitter as an organizing tool of the 2009 Iranian protests remains hotly debated, Twitter's importance in garnering international attention for a political cause is not. However, while the Iranian government blocked access to Facebook amid the protests, presumably because they felt the platform presented a demonstrable threat to their stability; they did not block access to Twitter, which may have contributed to its heavy use.

Iranian authorities also demonstrated their ability to use social networks to identify, harass, and otherwise intimidate protesters, a harbinger of what would later occur in countries throughout the Middle East. While their tactics were reportedly rudimentary, relying on manually identifying faces in images and videos, their strategy nonetheless served to intimidate Iranian citizens.

In March 2010, Thailand's United Front for Democracy Against Dictatorship (UDD), whose supporters are commonly known as Red Shirts, organized demonstrations to demand that the prime minister dissolve parliament and hold elections earlier than scheduled. After negotiations between the UDD and the government failed, the protests escalated into violence, with more than 80 civilian deaths and 6 police deaths in a period of two months.

Amid the protests, media researchers documented a significant rise in Facebook users: an increase of nearly 1 million between April and May 2010. At the same time, Thailand's Deputy Prime Minister Suthep Thaugsuban reportedly ordered the blocking of television and community radio stations and Web sites that broadcast "subversive" stories. The blocking of news Web sites and blogs may have contributed to the rise in Facebook users: The platform may have served as a central location for information sharing at a time when popular sites were blocked. Twitter, which remained unblocked, also served to spread information, as well as serving as a guide for journalists to locate sources amid the demonstrators.

Thailand's Internet penetration in 2010 was roughly 22 percent, or 14 million users, roughly comparable to the number of users in Iran a year prior. At first glance, the two scenarios are quite similar: social media-fuelled protests lasting a period of several months, followed by an eventual crackdown by authorities. What distinguishes these two scenarios from one another is not related to technology; it is the political environments, the demands from protesters, and other cultural and sociopolitical barriers.

Analysis

In analyzing the role of social media in political movements, popular media has often focused on the use of social media among members internally, particularly for the purpose of organizing.

Meanwhile, scholars such as Zeynep Tufekci and Christopher Wilson have demonstrated that social media allow for information sharing that is beyond the control of governments, and can be crucial for individual decision making about participation. New network configurations enabled by social media often allow for previously disconnected publics to unite, thus enabling the rise of new political ideas and identities. In authoritarian countries, these connections are particularly important because they may be the only tolerated means by which individuals organize. Still others have looked to the role that social media play in information dissemination and in informing popular media.

Social Media and Politicians

While the use of social media by political opposition movements has been a popular topic in the media, mainstream and incumbent politicians have found effective uses for social media platforms, as have authoritarian dictators.

An early example of social media used in a political campaign comes from the United States, where in 2004, presidential hopeful Howard Dean was lauded for his campaign's use of the Internet, built with a dedicated director of Internet outreach. Just three years later, during France's 2007 election in which incumbent president Nicolas Sarkozy faced off against Ségolène Royal, a member of the French Socialist Party, social media once again became a point of discussion, as both campaigns developed innovative online tactics. Sarkozy's party, the *Union pour un Mouvement Populaire*, or Union for a Popular Movement (UMP), dedicated 1.5 million euros to its digital strategy, which included sending short messaging service (SMS) to party members in advance of Sarkozy's television appearances, keeping French video-sharing site DailyMotion updated with videos of the candidate, and purchasing sponsored links on other sites.

Royal's campaign, on the other hand, created and launched a Web site called *Désirs d'avenir* in February 2006, which served as a social network throughout her campaign and beyond. At the start of her campaign, Royal declared that 50 percent of its initiatives would take place online, establishing her as an innovator. All of the content on *Désirs d'avenir* was released under a creative

commons license, which meant that it could all be freely shared, resulting in the creation of several similar Web sites, including Segosphere.net, a Web site for young supporters of Royal.

Although Royal lost in 2007, she continued to make use of social media, tweeting alongside activists during debates in the 2012 French elections during which her former romantic partner, François Hollande, was a candidate. Royal, however, also blamed Twitter as the reason for her loss in the 2012 French parliamentary election, demonstrating the influence of social media in French politics: Hollande's new girlfriend, Valérie Trierweiler, sent a tweet wishing good luck to Royal's rival, which Royal reportedly believes resulted in her loss.

In the 2009 Iranian presidential elections, all four approved candidates utilized social media. Opposition frontrunner Mir Hussein Mousavi's supporters conducted digital interviews, including with Mousavi backer and former Iranian president Mohamad Khatami. Interview questions were submitted through social media, including Twitter, Facebook, and Yahoo! Messenger. Another candidate, Mehdi Karroubi, also developed a social media strategy, perhaps influenced by his advisor, former president Mohammad Ali Abtahi, an active blogger. A third candidate, Mohsen Rezaei, used his Web site to list bloggers who were supportive of his candidacy.

The campaign of incumbent candidate Mahmoud Ahmadinejad, whose blog was launched in 2006, developed the most comprehensive online strategy, listing more than 100 bloggers supportive of his candidacy on a campaign Web site, creating blog badges for fans to place on their sites, and utilizing Twitter, Facebook, and other social media to send updates and links to videos about the president.

Venezuelan president Hugo Chavez has claimed that nearly 20 percent of the messages he receives on Twitter are hostile, reports the BBC News. The Latin American politician also claimed that in 2010, he hired a staff of 200 to help him deal with the influx of responses he received on social media sites.

Social media was also picked up by candidates in India's general election in 2009. Dr. Shashi Tharoor, the former undersecretary for Communications and Public Information to the United

Nations and the 2009 Congress Party candidate in the general election, utilized Twitter throughout his campaign, and just a few months after losing the elections, became the first Indian politician to reach 100,000 followers.

Other Indian politicians, such as Narendra Modi, chief minister of the state of Gujarat, have kept on top of social media developments, utilizing newer tools such as Google+. Modi, who was outspoken against his state congress's silencing of journalists who were critical on Twitter, became the first Indian politician to host a live chat using Google+'s Hangout feature in August 2012. On the day of the Hangout, the Twitter hashtag #ModiHangout became the top trending topic in India, while the hashtag #VoteOutModi, created by Modi's opponents, came in third on the list of trending topics that day, demonstrating the widespread use of social media by India's politically savvy.

In neighboring Pakistan, where Facebook and Twitter rank highest among social media platforms, social media became an integral part of politics in 2009, the year that both former president Pervez Musharraf and presidential hopeful Imran Khan created Facebook pages.

Although Internet penetration in Pakistan is fairly low—approximately 10 percent, or 17 million users—social media is central to the strategy of Imran Khan's political party, Tehreek-e-Insaf (PTI). In addition to Facebook, the PTI has used YouTube and Twitter to reach out to the public in advance of the 2013 Pakistani elections. Its various Twitter accounts, including @ImranKhanPTI, @ptiUK, @PTIOfficial, cumulatively have more than 500,000 followers, while videos on its official YouTube account have been viewed more than 5 million times. The party also has an account on Livestream, where it regularly streams live speeches and rallies.

Nepal is another south Asian country in which social media has become vital for politicians. In May 2011, using Facebook and other social networking sites, young Nepalese launched a campaign to pressure political parties to draw a new constitution for Nepal. By contrast, a December 2011 political incident to which the U.S. ambassador responded on Facebook prompted the leader of the Nepali Congress, Gagan Thapa, to proclaim that the ambassador was unnecessarily meddling

with local affairs. In response, Thapa and the congress were criticized by young bloggers for not understanding how social media works.

Across sub-Saharan Africa, Internet penetration remains low, but social media is nonetheless a feature of politics in many countries. In Tanzania, traditional political campaigning involves handing out merchandise, but politicians—including the president, who tweets as @jmkikwete and parliamentarian Zitto Kabwe, who tweets as @zittokabwe—have recognized the importance of social media in reaching young constituents. Kabwe, notably, tweets mainly in English, but also maintains a blog in Swahili.

Amid the crisis following Côte d'Ivoire's 2010 elections, two politicians—Prime Minister Guillaume Soro and Minister of Youth Development Alain Lobognon tweeted using pseudonyms, both later creating accounts in their real names after

A Liberian user logs into Ushahidi, which was initially developed as a means of tracking incidents of violence during political unrest in Kenya. It has since been used worldwide during political events and natural disasters.

the elections were sorted. Both men, particularly Soro, are prolific on Twitter, interacting with citizens frequently.

In South Africa, which has the third-highest Internet penetration in sub-Saharan Africa (after Kenya and Nigeria), opposition parties and candidates have directly engaged with constituents on social media, signaling a shift in approach for the nation's politics. For example, the Democratic Alliance, a leading party in South Africa, has hosted Twitter town halls and discussions on local social networking site MXit.

In the Middle East, few major politicians have picked up social media, with notable exceptions. Jordan's Queen Rania and Queen Noor (the queen dowager) were both early adopters of Twitter, and Queen Rania's YouTube channel is popular throughout the region. Bahrain's government runs several official accounts (such as @moi_bahrain, representing the Ministry of Interior), but only its Foreign Minister Khalid Alkhalifa utilizes the site to converse with admirers and detractors alike.

Several prominent Lebanese politicians, including former Prime Minister Saad Hariri and Prime Minister Najib Mikati (@Najib_Mikati), utilize Twitter. While Lebanese politicians on Twitter generally interact with their own citizens, most are multilingual and tweet in Arabic, English, and sometimes French. In December 2012, a controversy erupted after Lebanese security agencies demanded the social media passwords and other data of Lebanese citizens for the purpose of investigating the October 2012 assassination of the head of the country's information services. Lebanon's Minister of Telecommunications Nicolas Sehnaoui took to Twitter to protest the request, using the hashtag #ProtectPrivacy, and encouraging citizens to tweet: "As a Lebanese Citizen I refuse to give up on my Internet Privacy."

More than a year after the uprising that ousted President Hosni Mubarak, Egypt's political parties have learned to adapt to the social media era. @IkhwanWeb, the Twitter account for the Muslim Brotherhood—the party of President Mohamed Morsy—tweets frequently, and has notably traded jabs with the Twitter account of the U.S. Embassy in Cairo. Social media also continues to be important for political movements, possibly helping to instigate protests against Morsy's presidential decree in November 2012.

One of the potential pitfalls of social media for politicians is the ability of content to immediately go viral, or spread quickly, offering no chance for backtracking. Just as the U.S. Embassy caught the Muslim Brotherhood in a lie on Twitter, Estonian President Toomas Hendrik Ilves—disappointed by one of the *New York Times* journalist's columns—took to the social media platform to call out Paul Krugman for being "patronizing" in a piece he wrote about Estonia. Ilves vented his anger across several tweets containing profanities (which he censored with an asterisk) and American jargon.

Social Media and Diplomacy

Conceived by the U.S. Department of State, 21st-century statecraft is a concept that involves "complementing traditional foreign policy tools" with new, digital tools that "fully leverage the networks, technologies, and demographics of our interconnected world." In its efforts to promote 21st-century statecraft, the Obama administration has adopted social media, presumably encouraging other departments to follow; this has resulted in the use of Twitter and Facebook by embassies, consulates, and other officials.

The concept has been championed by some, such as former state official and current Google Ideas Director Jared Cohen and Google Chair Eric Schmidt, who have argued that governments that fail to engage online will be caught off guard by rebellious citizens "armed with virtually nothing but cell phones." Scholar Philip Seib has argued that the lagging response by the United States to the Arab Spring was a "failure to appreciate the importance of social media in modern politics," and that traditional diplomacy efforts were "left behind" in the midst of the uprisings.

Others, such as Evgeny Morozov, have criticized 21st-century statecraft, stating that the U.S. government is "showing too much admiration" for Facebook and Twitter, which he argues have "questionable ethics."

The Impact of Social Media on Politics

Given the rapidly changing nature of social media, it is difficult to assess the impact of social media on politics around the world. For the same reason, it is difficult to predict future implications of social media's impact on the international realm.

One important factor is the Internet penetration rate, or number of Internet users, in a given country. In France, where the use of social media in politics is widespread and arguably influential, Internet penetration exceeds 80 percent; in Lebanon, just over half of the population uses the Internet. In some countries, mobile penetration rates are a greater indicator of potential social media engagement. In India, for example, only 10 percent of citizens have access to the Internet, but 72 percent have access to mobile phones. In Libya, mobile penetration is more than 150 percent (meaning, generally, that some citizens have more than one mobile phone), but Internet penetration rests below 20 percent. Numerous factors unrelated to technology may affect its successful use for political means, including the form of government in a country and the politicization of a populace.

International Unrest and Revolution

At age 11, Malala Yousufzai began writing, using a pseudonym, a blog for the BBC about living conditions under the Taliban in the Swat Valley of Pakistan where she lived. A great deal of what she wrote involved the difficulties of attaining an education, including the Taliban's destruction of 172 schools. In 2009, after the Taliban issued an edict that all girls in northwestern Pakistan be banned from school, Yousufzai began publicly speaking out through her blog and other media outlets about the need for girls to receive a quality education. Her father, an educator whose school refused to honor the edict, had raised her to stand

up for what she believed in. For her work, Pakistan bestowed upon her its highest civilian honor for bravery. However, the media attention also attracted Taliban militants, who shot Yousufzai in the head and neck on October 9, 2012, as she came home from school. The militants stopped the van that the 14 year old was riding in, and demanded that the children identify Yousufzai. When they did, she was shot, along with two other girls. As threats against her continued, she was airlifted to Britain to receive specialized care.

While Yousufzai has recovered and returned to school in Britain, her story illustrates the benefits and dangers of communication in a global media environment. Social networking/media, international cable channels, blogs, and mobile and citizen journalism have given increasingly more groups of people a chance to not only tell their stories, but also hear the stories of others. Many of those stories are coming from voices that did not have a platform from which to speak until the development of social media. Recent international protests have shown that social media can be a tool used by these dissident or minority groups to spark and sustain revolutions. The use of social media sites does not require a high level of computer proficiency or a large amount of expensive equipment. All that is really required is a smartphone that permits the user to place his or her posts across a range of interconnected social media platforms. In this way, anyone can become the voice of a revolution. However, it is overly simplistic to say that social media were the cause of or the sole reason for success of the international revolutions seen in the 2000s. There are many other factors that must come together to make a protest succeed.

In order for there to be a revolution, regardless of what communication tools are available to fuel it, there must be a group of people who share a common goal or passion. That passion must be so strong that it allows participants to overcome the fear of personal reprisals or harm. Whether these conversations occur in the salons of France or on a Facebook wall, revolution is born from discussions of shared concerns and desires. Communication and communication networks are vitally important for protest movements to not only grow, but also to gauge when the time is correct to ignite and spread. Therefore, controlling, or at least having

significant access to communication channels has been seen as a crucial component in the creation and success of social or political activism throughout history, especially in modern times.

Communication Technologies

In looking at revolutions from a historical perspective, communication technologies have played a role as platforms for public speech. During the Reformation in Europe, the printing press allowed for a wider distribution of revolutionary thought, although it was limited by high illiteracy rates. Throughout the period leading up to the American Revolution, the postal system designed by Benjamin Franklin carried revolutionary materials to all the 13 colonies. The Vietnam War was brought into American living rooms via television, and the images shown decreased support for the war effort. Live images of the collapse of the Twin Towers in New York City on September 11 heightened the intensity of feelings about the responsible terrorists. However, technology is only one piece of each of these events, and it was not technology alone that caused them. Technology must be used appropriately by human agents in order to have an impact. Therefore, communication technology on its own is not enough to cause change, but it can help coordinate and organize it.

Social media allows protesters to organize their activities during all stages of activism. During this process, communities and collective identities are formed that provide strength and cohesion to people who have often started as marginalized groups. It does not matter if these activist groups have large amounts of resources because few resources are needed if the organization is occurring in cyberspace. Activists do not need to spend large amounts of money printing pamphlets or posters, nor do they need the resources necessary to own a mass media entity. Mass media allow for the broad dissemination of information about a cause, but social media allow for not just that, but also for the ability to recruit and organize new members, as well as to coordinate activities and craft new messages. In other words, social media create a space for two-way communication that is outside of government-controlled media channels.

Social media can also keep the issues that fuel the revolution in front of potential protesters and the world 24 hours a day, rather than on

an occasional news report. Keeping the issues in front of as large a group as possible increases the chance that more people will join or support the movement, and increases its opportunities for success. Unlike mass media, social media also allow for an instantaneous dialogue between activists and outsiders that works to increase the realism of events as they can be observed in real time, and without the perception of having been edited by an authoritative or corporate group. Finally, social media bring back some of the interpersonal dimension of face-to-face communication, which is why social media interactions can have stronger levels of influence over behavior. However, all computer-mediated communication has the potential for misinterpretation or the feeling of impersonality, so the impact in terms of influencing behavior can be tempered.

An additional advantage of social media for disseminating revolutionary discourse is the dissolution of space and time barriers. Communication through social media is both instantaneous and repeatable around the world. Broadcast signals or publication runs have significant limits in terms of reach to a potential audience. Theoretically, the Internet can reach anywhere, thus giving it the broadest possible influence. In reality, the reach is not so absolute or universal. While it can be one communication form, it cannot be the only one if the revolution is to succeed. The greatest hindrances for distributing information or organizing cyberactivism in social media are lack of open Internet access, access to equipment, and user knowledge.

Limits of Social Media

While social media allow for networking, there is concern that the ties built in social media are not strong enough to sustain cohesion throughout the often lengthy and dangerous process of social change. Once there is organization through social media, there has to be enough spirit to put the plans into action and take to the streets to call for political or social change. For example, in Egypt, the protests were supported by strikes of bus drivers, laborers, and even professionals such as doctors. In addition, protesters created a pamphlet, distributed online and in paper form in Arabic, which informed potential activists where and when to protest, escape routes,

and how to dress. The Egyptian protesters were extremely organized and knew how to frame the protests and mobilize the necessary resources. In the recent international revolutions that were successful, the activists were well organized and the organization transcended just one group or form of communication. While there were leaders in the organization that allowed for clear channels of communication, the leadership was spread out among members of the organization, rather than concentrated in one person.

While organization is crucial, it is not the only factor necessary for successful cyberactivism. Protesters must also use social media to frame how the world is seeing the revolution. As with any media, the stories presented in social media are not always an objective reflection of reality.

The camera only has so much range in front of its lens, and the perspective of the camera operator will determine what parts of a scene the camera sees or that the edited story contains. The person who is controlling this framing, either the state or the protester, will control how events are perceived by the larger public. In traditional media, there is little chance for a group that is not in power to have access to the media. Social media, however, changes that power dynamic. Anyone with Internet access can capture an event in such a way that the story supports their point of view.

Framing is especially important because members of the protest group try to bring others into the growing revolution. In order to maintain consistency of messaging, organizers need to try to control slogans, speeches, and videos that present the ideas of the revolutionary group in a context that can be understood by people within the country, but also by individuals outside of the country. In Egypt, there was a concerted effort made by supporters of the revolution to convince Western media to describe the uprising as a revolution, rather than a riot. Such terminology framed what was occurring in Egypt as an organized movement to enact change, rather than as disorganized acts of vandalism and looting carried out by random individuals. Videos and comments can be easily and instantaneously shared with the world to show how a group is mobilized around a central cause, and they encourage others to support the movement.

Social movements require three key factors to succeed: organization, resource mobilization, and framing. Having just one or two of these three key factors is often not enough. Social media provides a platform where all three can be utilized to bring like-minded individuals together around a common narrative that can then be disseminated to large numbers of people. In addition, social media can provide crucial on-the-ground information, such as where and when protests or meetings will occur, or directing aid to protesters who are wounded or trapped. Mass social movements are not unique to the digital era, but computer-mediated communication technology assists in the development of such movements and the dissemination of the movement's ideology to a global audience. Nowhere is this better seen than in the many protest movements of the early 2000s.

Political Use of Social Media

The first political movement to successfully utilize social media occurred on January 17, 2001, in the Philippines. President Joseph Estrada was engaged in an impeachment trial for allegedly receiving bribes, and on January 17, the Philippines Congress voted to set aside key evidence in that trial. In just two hours, a large protest was organized at a crossroads in Manila through the forwarding of text messages. By the end of the week, over seven million text messages had resulted in a protest group of over 1 million people. The size and swiftness of the protest caused Congress to reverse its decision, and Estrada resigned on January 20. Similar use of text messaging resulted in the removal of Jose Maria Aznar as Spain's prime minister in 2004.

While the cases of Estrada and Aznar could be seen as the first instance of a political leader being ousted by social media, text messaging does not possess all of the characteristics associated with social media. Social media requires the creation of online communities where users can create and share content, as well as post personal messages. It was not until 2009 that social media was used as a true device for political revolution. Activists in Moldova, a former Soviet republic, used Facebook, Twitter, YouTube, and LiveJournal, an electronic diary service, to publicize the political unrest in the region that followed the disputed general elections. On April 6, 2009,

protesters gathered in front of government offices in the capital, and the next day they were joined by opposition leaders.

In 24 hours, the size of the protest grew from 10,000 to 30,000 as a result of real-time dissemination of stories and pictures via social media. The official media of Moldova, however, did not carry any information about the protests. In spite of the international attention that was then focused on the protests, no political change occurred. However, the Moldova protests demonstrated that social media could be used as a source of political protest in the face of media censorship or government control of mainstream media.

This potential of social media was quickly tested in June 2009, in Iran. The unrest began, as it did in Moldova, after Iran's presidential election was called into question. Protests broke out June 13, 2009, when opposition leader Mir Hossein Moussavi asked for vote counting to stop because of violations. The government, however, declared incumbent Mahmoud Ahmadinejad the winner. Seven days of increasing protests followed as Moussavi continued to call for a new round of voting. The protests were the largest seen in the country since the 1979 revolution. Images and accounts of the protest were spread around social media sites, but primarily through Twitter. Twitter brought the story to the Western media after journalists were removed from the country, but also allowed Iranian protesters to organize because their communication could occur outside of government detection. At this time, social media were so new that governments were not aware of all of the ways in which activists were able to use them for organization or framing purposes. The U.S. State Department, however, saw the importance of Twitter during this uprising, and asked Twitter to postpone an upgrade in order to allow protesters continued access to the site. Twitter delayed the upgrade, which is one of the reasons the Iranian uprising is often referred to as the "Twitter Revolution."

The protests in Iran continued and steadily grew. Then, on June 20, a young woman, Neda Agha-Soltan, was driving and got out of her car after becoming stuck in traffic. As she walked, she was shot and killed by an unknown sniper; protesters said she was killed by a member of the militia, and the killing was captured by a cell

phone. The video went viral, and Agha-Soltan became a martyr for the protest movement. In spite of Iran's strict media censorship, the video, also picked up by mainstream American media, became a symbol for antigovernment protests. The government also made claims that protesters actually shot Agha-Soltan, and then altered the video to make it appear that she was killed by a member of a government-sponsored group. It is unclear if protesters were using social media at this time to organize their protests, or to simply report what was happening within the country, which is perhaps why the 2009 protests did not lead to any political change within Iran. The protest movement, however, is still prevalent within the country.

Many experts point to the Iranian uprising as the foundation for what has come to be known as the Arab Spring, or the Facebook Revolutions. In December 2012, a young man in Tunisia, Mohammed Bouazizi, set himself on fire to protest the police's repeated fines that resulted from his not having a license to sell vegetables, his only source of income. The self-immolation, an act that would be seen again in the Egyptian uprisings, was captured on YouTube and other social media sites. Mass protests followed his funeral, and those images were shared via social media. Tunisia, as well as many of the other countries involved in the Arab Spring, have citizens who are well educated and focused on activism. In addition, Arab countries have a large pool of young adults who are technically savvy. In Arab countries, almost 70 percent of the population is under 30 years old, as compared to 50 percent in the rest of the world.

In spite of heavy social media censorship, over a third of Tunisia's population had a presence on social media. Tunisia's north African neighbor, Egypt, began to send text messages and posting videos to show their support for the Tunisian activists. Perhaps the government did not go far enough to block the Internet during the uprising because advocates were able to use private networks to continue to spread their messages, in spite of YouTube being blocked. As a result, the protesters were able to oust Tunisian President Zine al-Abidine Ben Ali on January 14, 2011.

The success of the Tunisian Revolution, also referred to as the Jasmine Revolution (a moniker

that was subsequently borrowed by the leaders of a similar uprising in China that enjoyed far less success), sparked similar uprisings in countries around the Middle East and Africa. Next to follow was Egypt, where Google marketing executive Wael Ghonim worked under a pseudonym to build an organized network of activities that were connected through computer-mediated communication. Ghonim's primary Facebook page was titled, "We are all Khaled Said," a reference to an Egyptian who was beaten to death by police. Photos of Khaled Said, taken in the morgue, worked to undermine the government's official explanation for how he had died. Social media allowed protesters to organize events in Tahrir Square, and they were aided by a military force that was unwilling to turn against the protesters. Government censorship of the Internet was unsuccessful because Egyptian protesters, and the world, had learned from Tunisian's revolutionaries how to work around such blockages. A total of 18 days of protest resulted in Prime Minister Hosni Mubarak's resignation on February 11, 2011.

The Arab Spring then spread to countries such as Lebanon, Syria, Yemen, and Libya as activists gained knowledge and enthusiasm from successes in neighboring countries. For example, in Libya, the civil war resulted in the end of Muammar Qaddafi's regime, but it took eight months, rather than weeks, to occur. Libya was a much more closed off and authoritarian regime than those seen in Tunisia or Egypt. The protesters in Libya were not as well prepared to use social media. That changed as the Libyan government increasingly lost control of its citizens. Social media also helped to keep the ongoing war in front of the world. Lebanon and Syria also experienced protests, but there has not yet been a resolution to the unrest.

Problems in Protest and Social Activism

What is learned in these instances is that access to social media is not always a guarantee of success. While social media provides a significant opportunity for individuals who normally have limited access to communication to assert resistance to political control, the end results are not always what was intended. In Egypt, women joined the revolution in the hopes of gaining more rights. However, they had to use social media to encourage other women to come out to protest,

something that women are not normally allowed to do. Female activists knew that if women were to see any gains from the revolution, they had to leave the safety of their homes and computers and take to the streets with the men. For these women in Egypt and Tunisia, however, the revolution has not brought them greater freedoms. In fact, many women's groups are still struggling to gain any of the advancements the revolution promised.

Lack of progress for women speaks to the lack of common goals for all members of a protest. Any division or sectarianism among the protesters significantly hampers the ability of the protests to grow and succeed in the long term. In Iran, the populace did not have a very strong history of activism, and there was general apathy among the citizens over both the election and the candidates. It was therefore difficult to tap into a common interest to unify the activists. Also, if the government is more totalitarian and militaristic, as in Iran and Syria, then there is a greater chance that the military and/or police will work to violently stop the revolution. This possibility was seen in Thailand's Red Shirt uprising in 2010, where social media were used to organize the protest, but the government swiftly moved in and killed dozens. The protest was not strong enough to keep activists together after the killings. However, the presence of cell phone cameras during these crackdowns makes it easier for protesters to record the government's action and share the videos with the world.

Finally, as the use of social media as a protest tool grows, governments become more technologically savvy and learn new ways to block access to social media sites or the Internet in general. There are downsides to blocking the Internet. Governments are beginning to experience that shutting down access to the Internet can actually work to fuel dissidents, as well as bring worldwide attention to the protests, rather than stop the activism. Perhaps more importantly, preventing access to the Internet can also harm a country's economy because the Internet is so essential for international business.

Russia

The dichotomy of social media as a revolutionary tool is seen in the protest movement in Russia. Russia is experiencing rapid growth in the use of

social media and the Internet. Russians who are connected spend more time online than the citizens of any other country. Social media played a prominent role in the uprisings the country experienced beginning in December 2011. Even after the Cold War, Russians received their news from state-run media, but social media has leveled that playing field. After participating in elections that many felt were fraudulent, especially for Vladimir Putin's candidacy for prime minister, Russian protesters created videos to distribute on the Internet that criticized and satirized the government. Following the videos, social media were used by activists to organize the largest demonstrations in the country since 1991. On December 24, 2011, close to 100,000 protesters descended on Moscow.

Russian activists have access to Yandex, the Russian version of Google, where they not only shared information about the protests, but also organized pages to gather monetary contributions. The protests culminated prior to Putin's inauguration. On May 6, 2012, protesters organized a "March of Millions" event in Bolotnaya Square in Moscow. While the protesters were marching toward the square, they clashed with police, who responded violently. More than 250 people were arrested, including three leaders of the protest, and police put down smaller demonstrations throughout the city. In spite of the protests, Vladimir Putin was sworn in for a third term, and new laws were enacted in an attempt to stop opposition, including a penalty of \$9,000 for unauthorized demonstrations.

In addition, the government tried to take control of Russian social media. In April 2013, Vkontakte, Russia's Facebook, had its offices searched and its ownership structure altered. Vkontakte's owner, Pavel Durov, refused to stop antigovernment protest pages. After being accused of involvement in a traffic incident, two other cofounders sold their shares in the company to a fund owned by a board member of a state-owned oil company. This gave the government *de facto* control over the site. In spite of the turmoil in Russian social media, it allowed for the protests to continue to disseminate their public history. One year after the protests, social media helped to organize and globally publicize the anniversary of the May 2012 clash.

Demonstrators confront riot police in Taksim Gezi Park in Istanbul, Turkey, on June 11, 2013. Protesters shared photos like this on social media and photo-sharing sites like Flickr and used Twitter extensively, often employing the hashtag #occupygezi. On a single afternoon, more than 2 million tweets were sent in Turkey, and even after midnight, over 3,000 appeared in only one minute.

Turkey and Jordan

Protests begun in June 2013 in Turkey and Jordan also serve as case studies to help clarify social media's potential for organizing and framing international revolutions. In Turkey, a protest that began June 1, 2013, was not started by social media, but used social media to report on what was occurring and to keep the protest atmosphere alive. The protests began over the government's plan to tear down trees in the main square of Istanbul in order to build a shopping mall, but it became much more than that very quickly. The protest brought to the surface concerns over the actions of Turkey's Prime Minister Recep Tayyip Erdogan, who many protesters perceive as arrogant. Protesters used social media to repurpose a word, *capulcu*, which means "looter," which the government used in a derogatory manner to describe protesters in the early days of the

uprising. Citizens in Turkey turned the word into a new verb, *capulling*, which they defined as "protesting."

Facebook users changed their status to "I'm capulling today." In addition, protesters used social media to share photos. As the uprising continued, both protesters and the government took to Twitter to try and frame how the outside world perceived what was occurring. In one afternoon, over two million tweets were sent in Turkey, and even after midnight, over 3,000 were published in one minute. At the same time, the Turkish newspaper *Sabah* did not feature a story regarding the demonstrations on its front page. Instead, the newspaper attempted to frame what was occurring in the country by reporting on stories of the president and prime minister receiving a gift of a horse or an award for a piece of antismoking legislation, respectively.

Similar discrepancies between traditional mass media and social media were also seen in the coverage of protests in Jordan during the same time period. In both countries, protesters were met with extreme violence. The protesters and government in Turkey and Jordan have posted accounts of what occurred in an effort to control global perception of the ongoing crises.

Conclusion

While social media is a tool for potential revolution and social activism, the presence of computer-mediated communication is by no means a guarantee of success. Even the founder of Facebook, Mark Zuckerberg, downplayed the role of or need for Facebook in the recent revolutions. It is very possible that all of the uprisings discussed would have occurred without the presence of social media, but social media enabled organization of the protest movements as well as discussion of the movements throughout the world. Yet, certain aspects of social media are fleeting and limiting. Tweets are not archived, and therefore must be retweeted to keep those messages alive. Social media tends to be utilized by young professionals who are well educated. That limits the narrative from spreading outside of large cities, which is why organizers need to think of alternative means of message distribution.

However, the potential for social media to be utilized as an organizing and framing tool for political activism is apparent. It is for this reason that the U.S. State Department is working to ensure global Internet freedom, where governments would be prevented from restricting citizen's access to outside Internet sites such as Google, YouTube, and newspapers. This approach does nothing to protect conversations between individuals, which is where much of the political organizing occurs. There has also not been enough time elapsed to see what the true impact of the revolutions will be in each of the countries. New governments are still being formed to fill the power vacuums that resulted from the revolutions. In some countries, including Egypt and Tunisia, there is already concern that the new governments will be no better than the old governments in terms of solving the problems that originally led to the uprisings. What remains to be seen is if the movements started by social media, through digital activism or cyberactivism, can lead

to lasting change or serve as a blueprint for other types of protests.

Internet Forums

An Internet forum provides a place for sharing information and discussion about certain topics. It lowers temporal, spatial, and cost barriers that exist in face-to-face meetings and consequently increases participation in forums. Examples of its earlier forms are bulletin board systems (BBSs), electronic mailing lists (listservs), community networks on Freenet, and newsgroups on Usenet, which enabled users to post messages on public message boards and exchange messages and e-mails with other users. Different from these services, which were forms of two-way communication but not very interactive, in the Web 2.0 era, Internet forums became more synchronous based on social

media such as Facebook and Twitter, and more mobile based on software such as bbPress.org and fluxbb.org. Recently, for the U.S. presidential election of 2012, the Obama camp launched mobile applications that promoted interaction with voters by providing information on campaigns and policies and receiving feedback and responses. Along with the increased usability and sociability of the technology, the importance of Internet forums is growing in a political context, which leads to the discussion the positive and negative sides of Internet forums. Social media are used as a venue for political discussion, and play a role in civil society.

Based on the technological affordance for social interaction, Internet forums facilitate many-to-many interactions and draw much more participants than offline forums. In Internet forums, people can revisit and respond to other citizens' opinions with fewer barriers of time and space and traverse diverse modes of communication such as reading news and joining discussions. Access to government information is also facilitated on the Internet. Moreover, people with poor political resources can express their voices on Internet forums. Sometimes, Internet forums develop into virtual communities by having shared interests and returning participants. However, despite these advantages, Internet forums are susceptible to several problems. Given that the systematic, individualized filtering of information is possible on the Internet, Internet forums can be echo chambers of like-minded people. Despite the technological feasibility of many-to-many communication, a small number of people actually garner attention in the fragmented online environment. In addition, discussions in Internet forums are likely to be far from rational critical discourse, as found by empirical studies. The negligible attention to Internet forums from policy decision makers is also one of the limitations.

Recently, social media have opened up another opportunity as people are becoming increasingly engaged in seeking information and discussing politics on social network sites. While earlier forms of Internet forums were geared to asynchronous, bulletin board-style postings, social media promote livelier discussions with larger numbers of participants and increased responsiveness to each other's opinions. People can also create groups in social network sites and share discussions on

specific topics or with specific participants. Facebook groups and Twitaddons.com are examples. Although social media can exacerbate selective exposure to congenial ideas through receiving information that is highly personalized by one's like-minded friends, they can also provide a chance to be exposed to dissimilar opinions by facilitating contact with a population larger than a circle of one's acquaintances. Several studies have found that not only selective exposure to similar opinions, but also inadvertent encounters with conflicting opinions coexist in Internet forums.

In addition, political discussions shared in social network sites might not be deliberative, but the discussion can foster civic cultures more attentive to politics. Horizontal communication with fellow citizens and symbolic expressions such as parody and humor help people feel higher political efficacy and to be more engaged in politics. In addition, the viral capability of social media such as the retweet activity in Twitter allows discussions to extend outside the forum and generate social repercussions. Furthermore, the boundary of forums is not confined to written texts, but is broadened to audiovisual content, as observed in YouTube, where many people reply with self-produced video clips on certain political and social issues.

Conclusion

In the context of civil society, a frequently raised question about Internet forums is whether they constitute a public sphere where rational and deliberative discourse takes place, or simply a public space where anyone can express themselves. Some people reject this dichotomy, and suggest that Internet forums are a networked public sphere where social mediation takes place, diverse modes of communication exist, and lively discussions occur. Considering that online political discussions are found to increase political knowledge and participation, the importance of Internet forums should not be overlooked, despite their mixed possibilities as a public sphere. As social media permeates everyday life, Internet forums could serve a role as a barometer of public opinion.

Internet Gathering

Online protests are virtual activities where the Internet is both the site of and the means for collective action. These activities range from online petitions, e-mail campaigns, virtual sit-ins, online meet-ups, and rallies to hacking, e-mail bombings, boycotts, and netstrikes (or denial-of-service [DoS] attacks). The creative use of computer and information technologies facilitates online protesters' ability to perform civil disobedience in cyberspace, and even disrupt the flow of information. Such virtual protest activities are increasingly popular, especially among younger populations more familiar with digital media. Also, while the Internet is increasingly the site of protests, such online gatherings do not necessarily have to relate to political or civic activism. Indeed, Jennifer Earl and Katrina Kimport, for instance, have studied the rise of so-called fan activisms, where protest tactics—including e-tactics, such as e-mail campaigns—are used to demand nonpolitical claims, such as entertainment-based and sports-related petitions.

Internet gatherings rely on the use of the Web as a direct expression of protest—not just as a means to call for and organize collective action. Thus, the Internet not only facilitates mobilization and participation in traditional forms of protests (e.g., street demonstrations), but it is also changing the way in which activists communicate, collaborate, and demonstrate. Online protests take advantage of the Internet's power to foster collaboration and participation beyond time and space constraints. Unlike offline mobilization, Internet gatherings are not limited by the spatiotemporal copresence of actors, which gives them a more transnational character and augments a protest movement's reach because strangers from around the globe can simultaneously participate in any virtual activity.

Along these lines, Christian Fuchs describes the Internet as more than a global computer network, seeing it as a social system that is brought alive by the human activities and social relationships that occur on the Web. In his view, online protests expand the scope of different movements around the world. Because of the Internet, net citizens attain voices in a community of hundreds of millions of people, and information and communication technologies enable individuals to gather

online, to challenge government policy and corporate businesses, and to promote social change. No longer working in isolation from each other, net citizens are brought together into a global community via the Internet.

Such community-building capabilities are important for the success of any mobilization because protest activity needs both strong and weak ties, or connections, that evoke a sense of belonging and the trust required to sustain mobilization. The architecture of the World Wide Web allows for a local conflict to trespass boundaries—even national ones—and be carried out globally by new forms of online communities. Via Internet communication, protesters share meanings, collective identities, and practices in a global, digital public sphere. Not surprisingly, then, Internet gatherings can unite geographically dispersed individuals with specific problems and travails into a densely connected community. Online protests take advantage of the fact that the Internet in particular, and spaces generated by information and communication technologies in general, can be the site of civil disobedience by attracting masses of people and mobilizing global public opinion.

Examples

Examples of these kinds of virtual protests abound, from the United Kingdom (UK)-based hacktivist group Electrohippies' action against the computer network servicing the 1999 World Trade Organization (WTO) meeting in Seattle, Washington, to the so called Stop Online Piracy Act (SOPA) strike in January 2012, in opposition to the law proposed in the U.S. Congress. The largest online protest to date, with more than 100,000 Web sites in the United States and abroad joining the strike by going dark and posting anti-SOPA messages on their home pages, the SOPA strike resulted in the controversial bill being shelved in Congress. Other examples include the 2007 nurse-in organized by the Mothers International Lactation Campaign against Facebook policies that censored breastfeeding photos for being deemed as obscene content, a 2003 virtual march on the U.S. Congress organized by the Web-based platform MoveOn.org that resulted in blocked telephone lines for hours, and massive online protests in opposition to the impeachment

of former President of South Korea Roh Moo Hyon in 2004. Clearly, then, the Internet offers the means for massive online gatherings aimed at social change.

Besides disrupting online sites of real-world governments or businesses, online protests also are convened in virtual worlds. In 2007, Italian IBM workers organized a strike via the 3-D virtual world of Second Life. Roughly 2,000 people showed up for the online protest, and eventually the company responded to union demands. Other examples include the violent sit-ins and takeovers by aggravated users of online games, such as World of Warcraft and Ultima Online.

Impact

While increasingly popular, Internet-based demonstrations and e-tactics of collective actions have not replaced older, traditional forms of protesting. Some authors argue that, rather than a substitution, online protests complement offline actions. Oftentimes Internet gatherings incorporate parallel offline actions in order to reinforce and extend the impact of online protests. Likewise, scholars have found that the Internet not only has created online modes of existing offline protest actions, but it also has created a new repertoire of online actions.

Collective action also does not have to remain either online or offline. Rather, research indicates that the more individuals engage in offline activities, the more likely they are to also participate in online activities. Casting doubt on the assumption that online actions are somehow less valuable (e.g., the notion of slacktivism), studies increasingly are demonstrating that protest activities that begin online then move offline, with the potential for real-world impacts. In fact, some scholars argue that perhaps distinctions should no longer be made between offline and online actions because both are part of today's definition of activism. For example, scholars and media pundits alike point to the way the Internet, particularly social media, played critical roles in the Arab Spring and the Occupy Movement—both serving as examples of the way offline and online activism converged.

In addition to the online–offline comparison, online protests bring other potential pros and cons. On the one hand, Internet protesters can be

mobilized faster and in a territorially expanded space thanks to the Internet's global presence. Participation rates of online actions are often higher than those of comparable offline protests. In addition, online protests seem to offer a new way to engage segments of the population that traditionally have been disenfranchised from politics, such as young people or minorities. Empirical evidence from different countries supports the importance of online collective action to engage people in public affairs. This does not mean that the technology is a mobilizing force, but that users have found a way to use the Internet to express themselves and share information about their problems and concerns, thus helping mobilize users both online and offline.

Further, Internet gatherings allow individuals to join and leave causes and sites at will, avoiding formal involvement or commitment. While this might be empowering in terms of enabling civic or even political participation—such was the case during the elections in Iran—it also underscores the fact that Internet-based movements can be loose and less collective, and thus short-lived. Further, the anonymity that is usually present in online protests can translate into less collective trust than that of similar offline actions, also limiting a movement's sustainability. The lack of physical presence may also be a sign that individuals are joining online protests just to say they are part of a movement, instead of actually committing to being a part of the movement. The relative ease and lower costs and risks of online activism in comparison with offline activism often lead to the perception that online collective action does not generate the same levels of impact as offline activism. Online protesters have been criticized for being slacktivists or clicktivists, whose collective action is limited to clicking a link to support a cause. According to this argument, changing one's social media profile avatar to show support for a group or cause does little to nothing to provoke social change.

In addition, given that various social patterns—including social inequalities—are reflected to some extent on the Internet, the power of online protests and Web-based movements is mostly limited to those individuals with Internet access and know-how, potentially excluding the bulk of the world's population. Moreover, several studies

have documented the way that nondemocratic regimes have successfully blocked online gatherings or have used the Internet itself to monitor and then track down and arrest online protesters in detriment to the promise of cyber-democracy and the expressive power of the Internet in countries like China, Iran, or Indonesia.

Internet Society, The

The Internet Society is an international, nonprofit organization founded in 1992 in Washington, D.C., with its main purpose to "promote the open development, evolution, and use of the Internet for the benefit of all people throughout the world." The Internet is considered an important platform for fostering and sharing knowledge and promoting an information society, thus the ultimate mission of the Internet Society is to favor its development. Especially during the last 20 years, developments in information technology have made the Internet one of the most important and most used "containers" of information and knowledge. The possibility of posting, sharing,

and seeking content online has turned the Internet into an extremely cheap and fast platform for the production, distribution, and consumption of knowledge. The Internet Society's main scope is thus to "provide assistance and support to groups and organizations involved in the use, operation, and evolution of the Internet," including provision of "forums in which technical and operational questions can be discussed and provide mechanisms through which interested parties can be informed and educated about the Internet, its function, use, operation, and the interests of its constituents."

Organization

The Internet Society is sustained by the Internet Architecture Board (IAB), which is a committee initially created by the U.S. Department of Defense in 1979 for supervising the technical and engineering development of the Internet, and later became an international, public entity. It is the institutional home for Internet standard operating processes, such as transmission control protocol/Internet protocol (TCP/IP), or Internet protocol. The nonprofit organization was founded by a group of Internet pioneers from the Internet Engineering Task Force (IETF), who needed an institutional framework for collecting funds to support their activities for the protocol development. Today, the Internet Society comprises a network of 65,000 individual members, over 90 chapters, and 145 organization members around the world, and has offices in Reston, Vancouver; and Genève, Switzerland.

Eight executive senior managers, five regional bureau directors representing each continent, and a board of trustees manage the Internet Society. The board of trustees is the actual governing body, and comprises people elected or appointed by chapters or regional bureau directors for a three-year mandate. The senior management and the board of trustees are supported by an advisory council, whose main task is to provide advice on different matters related to global Internet and users. Members of the advisory council include service and equipment suppliers, academics, researchers, representatives from public interest groups and international organizations, and governments. The Internet Society is primarily supported by individual member donations and

member organizations' dues. Revenues are also obtained through direct sponsorships to the organization's different initiatives. Sources of support and funding are corporations, different regional, national, and international organizations, and Internet administrative infrastructures such as IAB, IETF, Internet Research Task Force (IRTF), Internet Assigned Numbers Authority (IANA), and Internet Corporation for Assigned Names and Numbers (ICANN).

Activities

For the past 20 years, the priority policies of the Internet Society have been Internet access and development, digital content and innovation, human rights and rule of law, Internet governance and trust, and privacy and security. The Internet is considered the engine for cultural, social, and economic development, and the organization tries to promote its use and knowledge. The organization works with the IETF, IRTF, and the World Wide Web Consortium (W3C) to stimulate research and assist the advancement of the TCP/IP protocol suite and the integration of new protocol suites, for example OSI, into the Internet architecture.

The activities of the Internet society can be grouped in three main areas: policy and standard advocacy, education, and development and recognition. Through its engagement in discussions on Internet policy, governance, development, and technology, the Internet Society tries to facilitate and support the development of standards, protocols, administration, and the technical infrastructure of the Internet. The organization is an advocate for Internet development and works with governments, national and international organizations, civil society, and the private sector to promote policies about the Internet that conform to its core values. It plays a key role in Internet governance discussions, including significant involvement in the World Summit on the Information Society (WSIS) and Internet Governance Forum (IGF).

The Internet Society promotes knowledge on technology, use, and application of the Internet, and supports online education and collaboration among organizations. In developing countries, training workshops on educational opportunities about the Internet are also provided. The Internet

Society offers community and ICT innovation grants to initiatives aiming at humanitarian, educational, and societal contexts of online connectivity; and individual fellowships to cover costs related to coursework, practical experiences, and mentorships of young professionals from around the world. The Internet Society offers three awards: the Jonathan B. Postel Service Award for an individual or organization who has made outstanding contributions to the data communications community, the Applied Networking Research Prize for applied networking research results, and the Itojun Service Award for individuals or groups who have made outstanding contributions to the IPv6 community.

One of the biggest challenges of the Internet Society is to overcome the digital divide problem, the inequality between groups of people around the world in terms of access to, use of, or knowledge of the Internet and other digital technologies. While the Internet is widely used and diffused in the northern part of the hemisphere and across rich regions, the southern hemisphere and poorer regions are lagging behind both in terms of availability of technological infrastructures that allow for the diffusion of the Internet and support for specific policies. Part of the digital divide problem is related to differences in Internet governance. The Internet Society is actively trying to foster the development and application of shared principles, procedures, and programs for the Internet across the world, which should help in removing some of the barriers for more equal use and diffusion of the Internet.

Iran

In the Islamic Republic of Iran, social media are significant political tools. This was most apparent during the country's 2009 presidential election and its aftermath. Following a contentious outcome that returned far-right conservative Mahmoud Ahmadinejad to office for a second term, both the opposition Green Movement and millions of Iranians who contested Ahmadinejad's re-election, and the conservative government and other supporters of the official results used social media heavily. Whether to spread information, organize demonstrations, conduct surveillance, or sway public opinion, they were used in a variety of ways that drove political developments and contributed to shaping Iran's political landscape.

The intensive use of social media during the 2009 presidential election period stemmed from an already widespread base of Internet users in Iran, the anonymity that Twitter and blogs offered, and the well-established popularity of these interactive services. While this trend peaked with the elections, it had begun in Iran well before then and continues today.

Iran's information environment flourished under the presidency of Mohammad Khatami, who held office from 1997 to 2005. His government significantly relaxed censorship and allowed numerous reformist newspapers and journals to operate in relative freedom. The Internet also became an important means of communication. Several newspapers and journals developed online presences, and Persian language blogs proliferated. Some of these blogs were devoted to news and political discussions, whereas others provided outlets for individual viewpoints and experiences of thousands of Iranians. When Mahmoud Ahmadinejad first came to power in August 2005, he reversed Khatami's liberalization of most media. Under his leadership, the Iranian government took tight control of radio, television,

and print outlets, and made decisive steps to curb use of the Internet. In March 2009, Reporters Without Borders placed Iran among the world's 12 top countries known for effectively censoring news and information and systematically repressing Internet users.

The Green Movement

On June 12, 2009, Islamic Republic-controlled media announced a surprise landslide re-election victory for Ahmadinejad, only hours after the polls closed. Thousands of Iranians took to the streets to stage mass protests. The Green Movement was born directly from this opposition to Ahmadinejad's re-election. The two reformist presidential candidates, former Prime Minister Mir Hussein Mousavi and former Parliament Speaker Mehdi Karroubi, emerged as its leaders.

A woman dressed entirely in green joins in a protest against the Iranian election of 2009 and in solidarity with the Iranian people in Union Square, San Francisco, California, on June 18, 2009.

The Green Movement relied heavily on Twitter, Facebook, text messaging, and the thousands of blogs created by ordinary Iranians to quickly organize and coordinate opposition efforts and public demonstrations, as well as to disseminate doctrine and political manifestos. The relatively modest equipment needed to use social media helped enormously; Facebook, Twitter, blogs, and text messages could be accessed through portable, handheld devices. These social media tools played a pivotal role in the drive to circumvent government censorship and secure broad support from different, often conflicting strata within the Iranian populace.

Specifically, Twitter had scheduled maintenance that would render the service unavailable on June 16, 2009, between 9:15 and 10:45 A.M. in Tehran. Users created a viral campaign to pressure Twitter to reschedule the work. Using hashtags such as #NoMaintenance and #TwitterStayUp, the campaign called for Twitter to perform the maintenance at 4:00 A.M. Tehran time, instead, to allow the streams of correspondence between Iran-based Twitter users to continue uninterrupted. By 5:00 P.M. on June 15, 2009, Twitter announced that it would change its upgrade time. Six days after the presidential election, Facebook released a beta version of its entire site in Persian. YouTube helped by loosening its usual prohibitions against graphically violent videos. As a result, videos of the Iranian upheaval were extensively broadcast on YouTube, capturing the attention of its massive, international user base.

One example is the video associated with the death of Neda Agha-Soltan. On June 20, 2009, Neda was shot by a member of the Basij militia—a paramilitary volunteer militia that takes orders from the Iranian Revolutionary Guard Corps (IRGC), a branch of Iran's military intended to protect the country's Islamic system. This happened during an antigovernment protest following the disputed presidential election, and Neda died on the street amid a crowd of demonstrators. Her death was captured as amateur video on mobile phones. These videos quickly spread across the world, eventually harnessing the attention of mainstream media and grabbing headlines on CNN and the *New York Times*. Soon, Neda Agha-Soltan became an icon of the Iranian

struggle against the government. In addition, the hashtag #Neda went viral on Twitter by the end of that day. When the regime prohibited her family from holding a public funeral, Karroubi used a Facebook post to call for public mourning of Neda Agha-Soltan's death.

The global nature of social media and the inability of observers to distinguish Iran-based users from users elsewhere also helped the Green Movement. With Twitter, for instance, in the days immediately following the election, appeals spread throughout the world: "Change your location on Twitter to Tehran, Iran." By multiplying the number of Twitter users who appeared to be in Iran, these appeals made it difficult for state operatives to identify and detain individuals tweeting against the establishment. The ability provided by social media to remain in touch with the Iranian diaspora and the rest of the world became especially important when the regime banned, and sometimes jailed, foreign journalists covering the election.

Response

Anticipating the role that effective communication and networking could play in organizing demonstrations, the government cut off mobile phone and text messaging services before the polls opened election morning, and service remained unavailable the day after the election. In the weeks and then months after the election, the Iranian information environment became progressively more repressive; for instance, the government drastically cut Internet traffic within Iran in the early postelection weeks. The Web site of a program produced by the IRGC for state television called *Gerdab*—originally aimed at exposing the "immorality" of bloggers—started posting photographs of Iranian protesters and requesting visitors to the site to identify them.

Also, the emergence of Neda Agha-Soltan's death video flew in the face of Iran's strong media censorship. It forced a move by the ruling government to exploit the same digital interfaces that were used against it. The government posted erroneous information about protest meeting times and locations on social networking sites, and unsuspecting citizens were met by baton-wielding militia forces. The regime started intentionally permitting Internet traffic to and from social

networking sites so that it could use a practice called deep packet inspection to collect information about users and to monitor mobile phone communications.

These measures did not deter the supporters of the Green Movement. In June and July 2009, supporters in and outside Iran initiated multiple Internet-based campaigns to take down the *Gerdab* Web site. Leaders affiliated with the Green Movement engaged in social media publicly, maintaining personal blogs, despite intimidation and threats of physical violence. However, most Iranians in the opposition attempted to remain anonymous through the use of computer proxy servers or digital safe houses that could strip out identifying information and allow viewing of blocked Web sites.

Twitter was particularly important during this tumultuous period. In contrast to blogs and Facebook, use of Twitter was difficult to extinguish because the technology has several points of access and does not require individuals to have Internet access in order to post tweets. Cost also played an important role also; whereas handheld devices with Internet access could be expensive for many, basic mobile phones were inexpensive and a standard item for the urban Iranian population. People could use their phones to post tweets via text messages.

As members of the opposition looked for ways to evade government retribution, the regime expanded its efforts. The IRGC's Center for Investigating Organized Cyber Crimes took on a heightened role. Originally founded in 2007, partly to investigate and confront social and economic offenses on the Internet, the center became increasingly important over the course of 2009 as the regime combated the opposition's online activities. The government also extended these measures to Iranians living abroad in the form of threats and intimidating correspondence targeting emigrants against the regime.

By dominating traditional media and infiltrating the same social media that it had systematically repressed, the Iranian establishment under President Ahmadinejad succeeded in consolidating considerable power over the information environment in the nine months following the presidential election. The Green Movement, however, gradually lost momentum. Its broad, fractious

nature proved a liability, and its leaders came under increasing pressure from the regime. As this happened, Iranians in the opposition began to use social media for different purposes. Twitter and Facebook no longer served solely to unify and coordinate. Instead, Iranians began to increasingly use these tools to express dissatisfaction with both the Green Movement and the international leadership for their perceived failure to meaningfully change the fate of the Iranian people. They also continued to communicate a multipronged message regarding the authoritarian nature of the Iranian regime and the importance of reform, and to show that the movement was still alive despite the lack of overt protests. One year after the election, Mousavi's Web site Kalemeh.com, though it operated outside Iran, remained a key channel of communication for the opposition leader.

Demonstrations in 2011 and 2012

The revolutionary wave of demonstrations and protests in the Arab world that began on December 18, 2010, eventually leading authoritarian rulers to be forced out of power by the people in several countries in the Middle East, influenced a series of demonstrations across Iran from 2011 to 2012. These began on February 14, 2011, and in essence followed the 2009 and 2010 Iranian election protests. In the days leading up to the protests, Internet access to specific sites, such as Facebook and Twitter, along with e-mail access, was blocked throughout Iran. The sites were replaced with a message reading, "According to computer crime regulations, access to this Web site is denied." A number of Iranian bloggers feared that this outage was a precursor to the implementation of the halal (permissible according to Islamic law) Internet.

Halal Internet

The fifth Iranian five-year plan, beginning in 2010, called for the creation of the halal Internet, an internal network that would contain only religiously acceptable material and promote Islamic values. It is feared that the Iranian government would use this to slowly throttle access to all outside sites, making them unusably slow and forcing users to settle for the national network. For instance, consequent to the incendiary anti-Islamic *The Innocence of Muslims* video uploaded on YouTube in July 2012, Iran

cut off access to Google, but was forced to restore access to Gmail after public outcry.

Since 2009, the Iranian establishment has taken several measures to control the information environment in Iran. How successful a halal Internet and these measures would be remains to be seen. Fortunately, creative strategies and social media have allowed Iranians to find novel ways around restrictions and make their voices heard.

Islam, Nation of

In the United States, religious organizations have benefitted from the growth of new technologies since the 1990s, and have embraced these forms of communication to reinforce their religious message and various theologies. In the first decade of the 21st century, Muslims in America accounted for the majority of producers and consumers of "virtual Islam." Therefore, English is an important language for the spread of a contemporary vernacular Islam via YouTube and other forms of social media. Although organizations such as the Council of American Islamic Relations (CAIR) and others play an important role in the projection of the faith

in the United States, older Muslim formations in the country have also played important historical roles in regard to social media. Of particular interest is the growing attraction of Muslim identity within several subgroups of the African American population. The Nation of Islam's utilization of media in various forms, from newspaper to contemporary social media, is the product of unique set of societal forces that impact African Americans to include cultural politics, social media, and emerging Muslim trends in social media.

The cultural politics of the 1960s included opposition to the Vietnam War, the Black Power movement, the Black Arts movement, and the United States' most vocal critic, Malcolm X. Two figures who would impact the national popular culture and consciousness were Muhammad Ali and Amiri Baraka, both Muslim converts influenced by the teachings of Malcolm X. However, the medium that would introduce them to a wider audience, especially Ali, was the Muslim newspaper *Muhammad Speaks*. With the emergence of its first issue of *Muhammad Speaks*, the Nation of Islam established itself as an alternative voice to mainstream civil rights news of the African American community. Its first issue came out in October 1961, and its circulation rapidly grew in response to discontent within the African American community. Developed by Malcolm X to be the Nation of Islam's official news organ, it communicated the ideology and concepts of its brand of Islam as articulated by its leader Elijah Muhammad, and grew into a circulation of 900,000 per week.

Founded as a religious and social movement, the Nation of Islam (NOI) was an offshoot of the Moorish Science Temple of America in the 1930s, and both organizations drew deeply upon principles developed by Marcus Garvey and the Pan African Garvey movement. Primary among these ideas were that African Americans must psychologically and physically defend themselves against white supremacy by developing and maintaining communities and worship deities in their image. *Muhammad Speaks* grew even quicker when one of Malcolm X's pupil's and NOI convert heavyweight champion Cassius Clay changed his name to Muhammad Ali, and was featured prominently on the cover of its paper. Following the assassination of Malcolm X and Elijah Muhammad's death in the 1970s, *Muhammad Speaks* was no

longer in circulation. However, in the late 1970s, Louis Farrakhan reestablished the newspaper as the *Final Call*.

Social Media

The *Final Call* online Web site was developed in 1995 by black Muslim college students to promote the Million Man March. Since 1995, it has promoted subsequent marches, and now operates as an arm of its newspaper and promotes itself as an alternative to mainstream media for black consumers in the Americas, the Caribbean, Africa, and Europe. Since 1995, *Final Call* online has expanded into news coverage in several areas, ranging from entertainment, athletics, business, health, and international affairs. *Final Call* kept up with developments in social media and joined Facebook in 2009, followed by Twitter and Google+, and extensively utilizes YouTube. *Final Call* online revealed that the U.S. Department of Homeland Security distributed intelligence information on the organization as part of domestic operations, concerned with the Nation of Islam's leadership succession. A lawsuit filed by the Electronic Frontier Foundation and American Civil Liberties Union (ACLU) uncovered the operation, and federal officials with the Homeland Security agency's Department of Intelligence and Analysis on October 12, 2007, admitted that they had the organization under observation.

However, the Nation of Islam expanded its use of social media to project its message via a #Ask Farrakhan social media Q&A at a September 26, 2012, town hall meeting at its headquarters. Farrakhan fielded questions from around the world via Twitter, Facebook, YouTube, and e-mail to address various issues of concern or interest. Additionally, the Nation of Islam has conducted classes on the advantages and disadvantages of social media and networks at events like its annual Saviors Day convention. For example, Muslims are admonished not to stop being or acting like proper Muslims simply because they are engaged with social media technology. Yet, members are also encouraged to embrace and leverage the power of social media and networking to conduct business, branding opportunities, and promote their art and other creative forms. Finally, the importance of social media to members of the Nation of Islam was evident when a conflict arose over the drop

in Twitter followers for their leader Louis Farrakhan, and a minor investigation was conducted to examine or explain the sudden loss in followers. However, during the advent of social media in the United States and globally, other Muslim groups have emerged to compete with the Nation of Islam to project the faith and politics of Islam, both domestically and abroad.

For example, the Muslim American Public Affairs Council (MAPAC) is a Muslim political advocacy group headquartered in Raleigh, North Carolina. The mission of MAPAC is in the area of political affairs; it collaborates with other media to promote a Muslim viewpoint. Moreover, it is involved with political and public policy to influence the local or national political process in order to defend the rights of Muslims. This behavior is in contrast to the Nation of Islam, which will primarily defend the rights of Muslims and African Americans. However, this also represents the diversity of viewpoints within the Muslim community. Yet, this perspective is often obfuscated by claims of other media that tend to singularly focus on the tensions between the Nation of Islam and select members of the American media or Jewish civic community. Nowhere does this tension emerge more than in the area of international or foreign affairs.

International Issues

The impact of the role of social media influencing the Arab uprisings in 2011 is still in dispute. While mainstream media encourages a broad understanding of a grassroots social media narrative, the Nation of Islam, among others, promotes and downplays the role of social media, and focuses on the realpolitik of the Middle East and Africa and the role that Western governments have played to destabilize the region. Evidence suggests that there was massive involvement from the average Muslim citizen utilizing social media in relation to the protests, and it also demonstrated how the Nation of Islam, through its social media, remains heavily engaged in foreign policy developments.

Islam and Social Media

Islam is the fastest-growing religion in the world. It is especially popular among young people who are connected to social media platforms. Digital platforms have markedly impacted the social life of Muslims, including their religious practices, religiosity, preaching, issuing *fatwas* (religious decrees), and building virtual communities in the Muslim majority countries or in diasporas. Just as other regions, the Muslim majority countries have recently witnessed a rapid diffusion and adoption of social media platforms such as Facebook, Twitter, and YouTube. In the Arab world, Facebook is the leading social networking Web site, with 45,194,452 users. Twitter follows with 2,099,706 users. The Arab region is second to the United States when it comes to the number of YouTube daily views. With 90 million video views per day, Saudi Arabia has the world's highest number of YouTube views per Internet user. The popularity of social media platforms in the Arab world has led some scholars to expect that its impact on religious life is likely to rise. The common argument is that social media have the potential to change people's religiosity and practices of piety. The impact of social media on religious behaviors of individuals and communities in environments characterized by conservatism and traditionalism, it is argued, will be even more profound than in environments characterized by liberalism and openness.

As for the followers of other book-based religions in the Abrahamic tradition, communicating and winning the hearts and minds of believers and non-believers through *dawa* (proselytism)

is a central commitment for many Muslims and Islamic preachers and leaders. Social media have become an invaluable means to pursue the path of dawa and the dissemination of the Koran. Only very few voices condemn the use of the new digital media as incompatible with Islamic practices. For instance, Abdul Aziz Al Shaikh, Grand Mufti in Saudi Arabia, advances a critical stance toward social media platforms such as Facebook and Twitter because, as he says, they disseminate lies and may destroy established relationships and Muslim families in the offline real world. In a similar line, religious authorities in some Islamic countries issued fatwas against the use of social media like Twitter, arguing for its incompatibility with Sharia (Islamic law) because of trading accusations and promoting lies. While some Islamic religious leaders advise their followers not to use social media platforms, the overwhelming majority of scholars and preachers capitalize on the effectiveness and efficiency of social media in engaging with the community of believers and enhancing their fidelity and loyalty.

In the first generation of the Internet, there were some traditional Web sites like Online Islam that acted as “one-stop shopping” for religious information and comprehensive services to the Islamic community, the *ummah*. These digital platforms led to the emergence of what some call “Facebook fatwas,” or “F-fatwas.” They introduced a new paradigm to the practice of religious instructions in the way they were formulated, issued, disseminated, received, and acted upon. The mushrooming of digital platforms during the second era of the Internet, Web 2.0, led to a process of undermining the monopolistic nature of religious orthodoxies. For many, social media have become the ideal platform, the new mosque or madrasa for the dissemination of the Islamic belief. F-fatwas spark commentary and feedback among many sectors of Muslim societies, including religious authorities, Islamist intellectuals, young urban or secularized Muslims, and ordinary believers.

Proselytization

One type of Islamic use of social media platforms is proselytization, which is widely popular among Islamic preachers. Some estimates put the number of Twitter followers for some

Islamic scholars at 600,000. Famous preachers like Tareq Al Suwaidan and Amr Khaled even reach 1 million when it comes to Facebook fans and “likes.” Ironically, some star religious scholars have social media accounts, even if they died decades ago, yet their religious and intellectual followers have aspired to reach new generations of digital natives and followers by creating Facebook pages, Twitter streams, and YouTube channels. Social media are an increasingly important source of religious information for many people in the Muslim world. As a result, a new media culture is emerging that is having a significant impact on global Muslim consciousness.

The use of social media is not limited to religious leaders, but is also used by normal Muslims who started tweeting Koranic verses and *ahadith*, or “prophetic sayings.” The dissemination of religious content regularly reaches its peak during Ramadan, when the degree of religiosity increases. The Ramadan Aperture, when Muslims are internally and externally motivated to receive and process religious content in form of tweets, is a new phenomenon that changes the way the Islamic faith is promoted among believers and nonbelievers. The very nature of a tweet, with its 140 characters, designed especially for ease of use and memorability, is a perfect tool for memorizing the Koran and the Prophet’s sayings. Tweeting Koranic verses and sayings from the Prophet have become a part of Ramadan religious rituals and habits. On the occasion of *Haj*, the pilgrimage to Mecca, pilgrims tweet feeds, offering a sense of virtual spirituality to their families like a vignette for the sacredness and presence of the holy place. Other pilgrims upload photos and clips from sacred places to share the rituals and spiritual experience. These practices contribute to the enhancement of co-religiousness and co-piety of the Islamic ummah (community).

Social media have become integrated in the habit of not only spreading the word of Allah, but also safeguarding Islam against critics from the outside. For example, Muslims created Facebook pages to defend the prophet Muhammad from attacks. The Web site “Social Media and Islam,” for example, is a page that “promotes the message of Islam on social media.” Social media also created an Islamic popular diplomacy.

Yemeni women undergoing computer training at a women's center in the city of Taiz, Yemen, in 2002. In 2013, there were more than 45 million Facebook users and 2 million Twitter users in the Arab world, and the region was second only to the United States in daily YouTube views. Saudi Arabia had the highest number of YouTube views per Internet user in the world, at 90 million views a day.

This involves the global mobilization of believers through virtual platforms in case of individual or group attacks on the Prophet or the Koran. Prominent examples are the plan of a U.S. pastor to burn copies of the Koran in 2010, and the dissemination of the anti-Islam video clip *Innocence of Muslims*. These incidents have triggered a global mobilization of Muslim protests by means of social media platforms. Countries such as Pakistan, Jordan, and Egypt asked YouTube to delete the film from its platform.

Some conservative leaders called for the creation and launch of *halal* (permissible according to Islamic law) social media platforms. As a response to these calls, a number of digital initiatives and projects were carried out. Islam-centered alternatives to Facebook, such as Muslimsocial.com, Muxlim.com, and SalamWorld started to

appear; yet, their adoption rate is still very low. The recent SalamWorld has sought endorsements from Saudi and *salafi* scholars (puritans). This social networking Web site filters what it views as harmful content, like pornography, terrorist activity, or human rights violations. Its mission is the respect of the values of Islam.

Social media have opened up the opportunity, especially for young Muslims, to engage with their faith and communicate to co-believers in a manner that their parents could never have imagined. Where once the ummah was a spiritual notion, with Muslim communities separated by language and geography, social media have broken down barriers and enabled young Muslims to connect, irrespective of where they are. It allows them to discuss what it means to be Muslim in the 21st century, especially for those

living in the Western Hemisphere. Teenagers and young adults of second- and third-generation Muslims living in western Europe and North America have become engaged in digital discussions and debates concerning religious issues and identities.

For some hyperdigital activists, social media provide the means for reuniting the ummah in a form of e-ummah. Digital social platforms, they hope, can contribute to the creation of virtual communities that may pave the way for eventual physical communities, and thus support the global cohesion of believers by weaving links between community members of the different countries worldwide. In some urban centers in North America and Western Europe, Islamic social media Web sites have contributed to the spread of Islamic icons, indexes, and symbols among members of the Muslim diaspora. Recent research has shown that young Muslims in Western societies are more receptive to religious beliefs and values. One indication of their religiosity is that they are likely to attend mosques more frequently. In the Islamic communities in the northern hemisphere, proselytizing efforts have been exceptionally successful. In Europe and the United States, non-Muslims accept invitations to convert to Islam. The personal videos of converters are broadcast on YouTube and discussed in virtual chat rooms. Young Muslims have uploaded a great number of videos that discuss issues related to the creation of the universe. For instance, there are about 70,000 YouTube videos on the “Scientific Miracles of Quran,” an indication of their special popularity.

Like mysticism, Sufism is a way of inner and mystical practices of Islam. The ritual-mystical practice is based on a master-disciple relationship. Adherents of Sufism are traditionally not interested in technology because spirituality is about silence and stillness, whereas digital social networking platforms are agile and restless. However, in recent times, even Sufi movements have made use of social media to practice their spiritual purification in the virtual world. It is remarkable that the applications of social media have led to an extension of Sufi spiritual sphere of influence and followers. The challenge for these Sufi groups is to adequately address the need for a direct and physical relationship with

the spiritual master, or *sheikh*, which is still a key moment to the Sufi experience.

Terrorism

In addition to the Sufi and other soft versions of Islam, there are also violent manifestations of Islam found in the blogosphere, enacted as Al Qaeda, Hamas, and Hizballah. The emergence of e-jihad in forms of digital activism, hacking activities, and cyberattacks has turned the blogosphere as a realm of civic use of social media into “Blogistan,” where aggressiveness and violence are prominent. The strongest manifestations of the use of social media for political or even militant Islamic movements are the recent Arab revolutions. The Arab Spring brought Islamist movements and political parties to power in many Islamic countries. Because they were denied access to the public sphere, they turned to digital platforms as an efficient tool for creating and distributing political messages, and for mobilizing followers and supporters for demonstrations. For instance, during the mobilization of protests in the Egyptian streets, social media-savvy activists used Facebook to schedule the protests, Twitter to coordinate, and YouTube to tell the world.

The recent return and rise of Islam is spectacular. It has been argued that the synergy of small media and social media have helped Islam to gain or regain a place in the contemporary complex social life. The continuous digitization of Islam and the Islamization of the digital world represents both a blessing and challenge to the religion of Islam in the 21st century, where closed systems are resisting the openness of instantly constant transparency and WikiLeaks effects. For centuries, interpretations of the Koran were kept a reserved domain for a tiny minority of *ulama*, or “scholars of religion.” Social networking Web sites, microblogging platforms, and mobile social apps have become profane avenues for disseminating sacred interpretations. Religious authorities on digital platforms are in the process of being undermined. The blossoming of digital fatwas is an indication of the splintering of orthodoxies and the emergence of heresies. The traditional concept of religious authority has come under attack, and has been shaken in many forms. Consequently, religious authority

has become a contested domain, rather than an accepted reality, for the uneducated masses.

Israeli–Palestinian Conflict

Advocacy of causes related to the Israeli–Palestinian conflict on the Web were already highly used before the rise of social media. Grassroots Web campaigns related to the conflict reached their peak during the first half of the 2000s, from the outbreak of the Second Intifada until the Israeli disengagement from the Gaza Strip in 2005. As with political campaigns elsewhere on the Web during that time, most campaigns related to the conflict were led by international and local non-governmental organizations (NGOs) and aimed at resonating in mainstream international and local media, a high rank in search engine results and a dense network of hyperlinked Web sites.

While the turn to social media as platforms for online advocacy related to the Israeli–Palestinian conflict has engaged larger publics and individual users, governments and officials from both sides of the conflict have developed a top-down approach to social media in order to shape international

public opinion, control coverage of mainstream media, and directly target their adversaries. At times of escalated conflict and violence, social media have been gradually implemented as a strategic tool for advancing informational war. With the rise of social media, Web campaigns related to the Israeli–Palestinian conflict have been decentralized and adapted to the unique characteristics of each platform. The long dispute over the recognition of Palestine as a state and of Israel’s unofficial borders has also migrated to social media platforms, where users from both sides of the conflict complained that platforms misrepresent their country.

Social Media on the Battle Field

Between 2006 and 2013, the Palestinian–Israeli conflict was marked by four periods of escalated conflict and military operations: the Hezbollah–Israeli war in the summer of 2006 (also dubbed the Second Lebanon War); Israel’s military operation in Gaza in January 2009 (also dubbed Operation Cast Lead, or the War on Gaza), Israel’s attack of the Turkish flotilla Mavi Marmara in May 2010, and the conflict between Israel and Hamas in November 2012 (also dubbed Operation Pillar of Defense). During these years and around these events, Israel, Hezbollah, and Hamas have significantly increased and elaborated their use of social media as a strategic warfare tool.

In 2006, Hezbollah used the advantage of real-time Internet press and social media as a tactical tool to bypass mainstream media coverage and to decrease Israeli public morale, whereas Israel was still relying on traditional informational tools such as targeting Lebanese combatants and civilians with push text messages and airborne leaflets. For example, on July 14, 2006, Hezbollah attacked the Israeli naval ship *Hanit* near the coast of Beirut, killing four Israeli marine soldiers. Within hours of the attack, Hezbollah posted footage of the missiles hitting the ship on YouTube. The footage had already circulated widely in social and mainstream media before Israel officially confirmed the event. It is also reported that Hezbollah monitored social media to determine the precise location of the rocket attacks on northern Israel.

Media Strategy

To learn the lessons from the war with Hezbollah, Israel established the National Information

Directorate to control and unify Israeli propaganda and public relations across different media outlets. By December 2008, Israel's launch of Operation Cast Lead in Gaza was accompanied by a massive and concerted informational campaign that combined traditional media, new media, and diplomacy. Israel gained full control on information coming out from the Gaza Strip by enforcing a media blackout that banned foreign journalists from entering Gaza. At the same time, the Israel Defense Forces (IDF) Spokesperson's Unit launched a YouTube channel, which given the media blackout, was the only source that journalists and mainstream media could report on. The IDF YouTube channel was viewed by millions, either on social media platforms or through mainstream media.

The Israeli Consulate in New York also held a press briefing on Twitter, but journalists ridiculed the statements, made in an abbreviated form to match Twitter's 140-character limit, as a gimmick. On the civic front, the Israeli foreign ministry recruited immigrants to blog in favor of Israel in its native language. The Intidisciplinary Center in Hertzlia recruited students to spread positive messages justifying Israel's military operation in social networking platforms and to post comments in Israel's favor on influential blogs. Hamas posted footage on PalTube.com, a video-sharing platform affiliated with the organization. Despite the media and electricity blackout, citizens from Gaza managed to send tweets, videos, and images with mobile phones. Gradually, information started to leak from Gaza. Palestinian journalists based in Gaza gave interviews by phone and Skype to international mainstream media outlets, and used social media such as blogs and Flickr accounts to report on the unfolding events. Outside Gaza, thousands of supporters of Palestinians used the Qassam Count bot, a social media utility that automatically updated their status to report the real-time events on the ground.

Mainstream media reporting had to accustom itself to the media blackout and incorporate social media as a primary source for covering the war. This included footage from the IDF channel, live video feeds streamed from Gaza news agencies, and Google maps to display the places of Israel's airstrikes and infantry incursion in Gaza, or the Israeli cities hit by Hamas rockets.

Mainstream media also made use of a collection of tapes released online by Al Jazeera under a Creative Commons license. Al Jazeera also implemented the crisis mapping code released by the nonprofit company Ushahidi, which displayed user reports made through a Web site or mobile phones.

In June 2010, Israel's media strategy was further implemented in the events that unfolded after the IDF's raid on a flotilla of six ships carrying activists and humanitarian assistance to Gaza. On May 31, 2010, Israeli naval commando soldiers boarded the six ships in international waters of the Mediterranean, but faced resistance from the activists on board the MV *Mavi Marmara*. A violent struggle unfolded, leaving nine activists dead and 10 soldiers wounded. The IDF detained the passengers and confiscated all cameras and footage obtained from the activists on board. As with the media blackout during Operation Cast Lead, the IDF posted a video on its official YouTube channel, claimed to be taken by the soldiers on board, to serve as evidence that the soldiers were forced to shoot in self-defense because the activists were armed and prepared for battle.

Critics of Israel claimed that the low-resolution videos might have been manipulated; yet, with all other media confiscated, Israel did not allow for other evidence to counter their claim. As with the media blackout in Gaza, over time, the photos and footage taken by activists appeared on various social media outlets, countered the Israeli narrative, and ignited heated debates from both sides of the conflict.

By November 2012, social media had been fully integrated by Israel and its opponents, to the extent that operation Pillar of Defense has been launched in Gaza, together with the IDF spokesperson's declaration of war on Hamas on Twitter. On November 8, 2012, the IDF Spokesperson Unit tweeted: "We recommend that no Hamas operatives, whether low level or senior leaders, show their faces above ground in the days ahead." In response, the Al Aqsa Brigade posted a countertweet, directly addressing the IDF spokesperson's Twitter account: "@idfspokesperson Our blessed hands will reach your leaders and soldiers wherever they are (You Opened Hell Gates on Yourselves)." In

2012, Twitter had become a platform for official real-time reporting of each side's successes and adversaries' failures, while attempting to actively engage followers by asking them to retweet if they found their claims to be right.

Grassroots Campaigns

Even before Palestinian and Israeli officials turned to social media as tools for informational warfare, social media were already widely used by grassroots organizations and individuals to advocate Palestinian and Israeli causes related to the conflict. Before the rise of social networking sites such as Facebook and Twitter, the blogosphere was the main platform for online grassroots advocacy. Most Palestinian and Israeli blogs are written in English in order to appeal to international publics. Alternative media outlets such as Electronic Intifada or Social Israel TV have gained popularity as authoritative sources that challenge mainstream media reporting of the conflict. Social media have also been used to mobilize dissident activities within Israeli and Palestinian societies. The Boycott, Divestments and Sanctions movement, for example, has gained popularity worldwide and has created a dense network of activists that use social media to mobilize support of Palestinian rights and criticize the West Bank administration's efforts to receive recognition of the Palestinian state around the 1967 borders.

Israeli activists have used social media to organize demonstrations against the Israeli occupation. In Gaza, the Gaza Youth Breaks Out is an example of a social movement that started as a Facebook group critical of both Israel and Hamas. Dissident voices have not always been welcomed by social media platforms, which at times have suspended their accounts. Facebook, for example, removed a page that called for a third intifada against Israel. Before it was removed, the group attracted over 300,000 fans and mobilized a march of Palestinians from Syria to cross the border with Israel in May 2011. Pro-Palestinian and pro-Israeli activists have also edited and re-edited Wikipedia entries related to the conflict. In most cases, such as with the entry "Gaza Flotilla Raid," Wikipedia adds a notice at the beginning of the article claiming that the entry might be subject to dispute or impartiality.

Recognition of Statehood and Representation of Borders

In 2010, the West Bank administration launched a diplomatic campaign in preparation for a bid for United Nations (UN) recognition of the Palestinian state around the 1967 borders. Many governments expressed their support of the West Bank government, declaring their recognition of the Palestinian state. In dismissing this diplomatic move, Israeli Deputy Foreign Minister commented that the recognition of Palestine by foreign countries is similar to clicking "like" on Facebook. Palestinian Prime Minister Fayyad, in return, commented that Palestinians are seeking more than a "Facebook state." While other platforms used various naming conventions, such as separate entries for West Bank and Gaza, Palestinian Territory or Occupied Palestinian Territory, Facebook was the first social media platform to add Palestine to its country list. Facebook's recognition of Palestine as a country was an outcome of fierce user activity organized around groups that petitioned for adding or removing Palestine from the platform's country list. Upon user requests, Palestine was first added to Facebook's country list, then delisted, and eventually relisted. In 2008, Israeli settlers also protested against Facebook for identifying their addresses as living in Palestine. Facebook eventually allowed settlers living in three large settlements to choose either Israel or Palestine as their home country.

Social media platforms that display geographic information such as Google Maps and Flickr were also sites of continuous dispute around the placement or nonplacement of the Palestinian Territories, and around misrepresentations of Israel's borders. In 2008, Google Maps displayed the Palestinian Territories as a grey area that did not contain any geocoded data. Although it is unclear whether Google changed its policy based on user protests, by January 2009, the missing data appeared, and most international media sources relied on mash-ups building on top of Google Maps to report the Israeli military's operation in Gaza, and Hamas' rocket fire into southern Israeli cities. As with Facebook, complaints were also made by Israelis that the localization service of Google AdWords did not show Israeli ads in areas outside the Green Line boundary, such as the Golan Heights, East Jerusalem, and the Jewish

Settlements in the West Bank. In November 2012, the UN granted recognition of Palestine as a non-member state. Following the UN recognition, on May 1, 2013, Google officially changed its naming convention from “Palestinian Territories” to “Palestine” across all of its platforms.

Issa, Darrell

Darrel Issa serves as a congressman in the U.S. House of Representatives from the 49th District (formerly the 48th District) in California (R). He is currently the chairman of the House Oversight and Government Reform Committee. To his supporters, Issa is a dedicated watchdog, seeking the truth on topics from Operation Fast and Furious to the attack on the U.S. Consulate in Libya. To his critics, Issa is a partisan zealot desperately seeking to embarrass and undermine President Barack Obama’s administration.

Darrell Issa was born in 1953 in Cleveland, Ohio. After graduating from high school, Issa enlisted in the U.S. Army. While in the U.S. Army, he received a business degree from Sienna Heights University. By the time he left the army in 1980, Issa became a captain in the army. Issa left the

army in 1980, and entered the private sector. He became a millionaire by the 1990s because of the success of his company, Directed Technologies, which sold antitheft auto devices. In 1998, Issa unsuccessfully ran for a seat in the U.S. Senate from California. However, two years later, he was elected to a seat in the U.S. House of Representatives from the 49th District. Issa easily won re-election in 2002, 2004, 2006, 2008, and 2012. He usually received more than 60 percent of the vote in his re-election bids.

In the House of Representatives, Issa was a staunch economic and social conservative. On the issue of abortion, the National Right to Life Committee gave Issa a 100 percent rating. On economic issues, he tended to vote for tax cuts and spending cuts, and against government spending programs. Issa voted against the TARP bailout in 2008, President Obama’s stimulus plan in 2009, and the Affordable Care Act in 2010. Issa was such a strong supporter of business that he received a 100 percent rating from the National Association of Manufacturers (NAM). On environmental issues, Issa proclaims himself a strong supporter of alternative energies. However, critics noted that Issa voted against President Obama’s cap and trade bill in 2009.

Darrell Issa entered the public spotlight in 2010 when Republicans gained control of the House of Representatives. Issa, who was a member of the House Oversight and Government Reform Committee, became its chair. As chairman, Issa began aggressively investigating the Obama administration. The most famous example was Issa’s investigation into Operation Fast and Furious, a federal government sting operation that put guns into the hands of Mexican drug dealers and led to the murder of a border patrol agent. Issa demanded answers and documentation from President Obama’s Justice Department, even subpoenaing Attorney General Eric Holder to testify before his committee. To Issa’s defenders, he was merely trying to determine the truth about a disastrous operation that was possibly covered up by the Obama administration. To Issa’s critics, he was a partisan Republican, using his committee’s powers to embarrass and undermine President Obama.

Issa also investigated President Obama’s handling of the attack on the U.S. consulate in Libya on September 11, 2012. Issa aroused controversy

when his committee released documents pertaining to the attack. Senate Democrats condemned the release, claiming that vital national security information was leaked by publicizing the documents. On the other hand, Issa's defenders insisted that Issa was merely trying to determine the facts of the matter, and that no vital national security documents were leaked from the document release.

Issa has had a combative relationship with the press. For example, Issa challenged a *New York Times* profile that claimed that he had enriched himself while serving in Congress. He responded that the article contained many factual inaccuracies. Contrary to the *New York Times* profile, Issa contended that he actually lost money on investments while in Congress. Issa is a controversial political figure who frequently uses the media to get his message out to the public. He often appears as a guest on the Sunday news shows to discuss his investigations into Fast and Furious, the IRS, and Benghazi. In addition, Issa regularly

uses social media, such as Twitter, to communicate with his constituents. As long as Republicans control the House of Representatives, Issa will continue to play a significant role, to the delight of his supporters and the chagrin of his critics.

J

James K. Batten Award

Named after a prominent newspaper executive, the James K. Batten Award began as a recognition of excellence in civic journalism in 1995. After eight years, the award was transformed into a prize celebrating innovations in journalism, becoming known as the Knight Batten Awards.

Sponsored by the Pew Center for Civic Journalism, the James K. Batten Award worked to acknowledge the efforts of those print or electronic journalists whose work encouraged individuals' participation in and contributions to the life of their communities. The Knight Batten Awards, which focused on new media and interactive and participatory journalism, helped to acknowledge the growing power of social media in political and other matters affecting communities. After 2011, the Knight Batten Awards, which had been sponsored by the Knight Foundation, were ended.

James K. Batten

James K. Batten, born in 1936, served as chairman of the board of directors and chief executive officer (CEO) of Knight-Ridder Inc., a media conglomerate that included daily and weekly newspapers, television stations, and other companies that focused on the electronic transfer of news and data. Upon graduation from Davidson

College, Batten began working for a Knight-Ridder newspaper, the *Charlotte Observer*, in 1957, and moved to Knight-Ridder's Washington, D.C., bureau eight years later, where he became known for covering the civil rights movement. After later serving as the city editor of the *Detroit Free Press*, Batten moved into management at Knight-Ridder's corporate offices, becoming company president in 1982, and chairman of the board in 1989.

In 1995, Batten died at the age of 59 of a malignant brain tumor. In his honor, the James K. Batten Award for Excellence in Civic Journalism was created and first awarded in 1995. The first award was given posthumously to Batten in honor of his lifelong commitment to making journalism a building block to invigorating citizenship while adhering to a mission of accurately reporting difficult and discomfiting facts.

Batten's work to ensure that journalists were connected with the communities that they served culminated in the creation of what has become known as civic journalism. This term is taken from a speech Batten gave to students at the University of California, Riverside, about the need for journalists to adhere to an ethos that emphasizes connections with those they serve. Before his death, Batten assisted the Pew Charitable Trusts in establishing the Pew Center for Civic Journalism. Batten used his extensive connections with

news organizations around the globe to assist in the formation of the Pew Center for Civic Journalism, and upon his death, the Pew Charitable Trusts established the James K. Batten Award for Excellence in Civic Journalism with annual prizes totalling \$25,000. In addition to the awards ceremony, a symposium occurred, where issues facing those interested in civic journalism could be addressed.

The James K. Batten Awards for Civic Journalism were given between 1995 and 2002. The location of each year's awards ceremony and the accompanying symposium moved annually, and took place at locations such as the University of Minnesota, Boston University, Kent State University, and the University of North Carolina at Chapel Hill. Topics covered by the symposia included new media, new journalism, race and civic journalism, and the legacy of journalism.

Beginning in 2003, the awards became the Batten Awards for Innovations in Journalism, later called the Knight Batten Awards. Although funding for the Knight Batten Awards ended following the announcement of the 2011 winners, the new format of the recognition process greatly expanded perceptions of how social media contributed to and could become journalism. The broader focus of the awards helped to improve perceptions of new media in the eyes of the public.

Knight Batten Awards

The Knight Batten Awards sought out new advances in interactive or participatory journalism, which included social media in ways that the James K. Batten Awards had not. This change was intentional, because the Knight Batten Awards were intended to increase attention on approaches that spurred wider audience engagement, encouraged innovative forms of information sharing, and nurtured nontraditional dealings between different groups that had a positive impact on communities. The Knight Batten Awards were administered by the J-Lab, a research center of the School of Communications at American University in Washington, D.C.

Over the eight years the Knight Batten Awards were given, they helped to foster deeper dialogue between news providers and the audiences that they served. The new prizes also helped to change

the definition of what constituted the news, and helped to create new ways by which useful information was disseminated, distributed, and delivered. To that end, the Knight Batten Awards were highly successful.

Following a process similar to the previous honors, the Knight Batten Awards combined recognition of digital engagement that grappled with public issues with a series of symposia intended to focus attention upon emerging media and forms of communication. As they broadened conceptions of what constitutes the news, the Knight Batten Awards encouraged a variety of new forms of creative thinking. These forms of out-of-the-box approaches to the news included creative use of mobile devices such as cell phones or global positioning system (GPS) tools, data-mining schemes, innovative initiatives encouraging citizen-led media, news games, networked journalism projects that combined "old" and "new" media, online applications, and social networking approaches to gathering or disseminating information.

Symposia that followed the awards explored how news gathering connects with and fosters connections between communities, how new media such as blogs have affected both local and national political races, digital delivery systems and how they will evolve, and how new institutions such as the "newseum" are changing how society thinks about both news and community.

John Aubuchon Press Freedom Award

Each year, the National Press Club (NPC) gives the John Aubuchon Press Freedom Award. The award honors at least one U.S. journalist and at least one international journalist who “embody the struggle to advance press freedom and open government.” Recipients have included print journalists, broadcast journalists, and bloggers.

The Award

The John Aubuchon Press Award was established in memory of John R. Aubuchon, the 95th president of the NPC, who died in 2003 at the age of 57. Prior to heading the NPC, Aubuchon had a career in broadcast journalism that spanned more than three decades, and included stints at UPI, CNN, and Maryland Public Television. During his career, Aubuchon was a staunch advocate of press freedom.

The National Press Club, which sponsors the award, is located in Washington, D.C., and serves as a social and professional organization for journalists. It has more than 3,500 members, and hosts approximately 2,000 events each year.

Typically, the Aubuchon award committee recognizes an individual or individuals who typify a broader class of journalists who are suffering from government prosecution or enduring other hardships. In addition, many of the awardees have reported from war zones, and some have suffered physical injuries or have died while covering these conflicts.

Award Recipients

In 2007, the domestic award was given to Pete Weitzel, a former editor of the *Miami Herald*, for his work as a press freedom advocate. Weitzel worked with several nonprofits, including the Florida First Amendment Foundation, the National Freedom of Information Coalition, and the Coalition of Journalists for Open Government. Also honored that year was Anna Politkovskaya, a Russian journalist who was assassinated in 2006. The NPC honored her posthumously with the international Aubuchon Award, citing her critical coverage of Russian military operations during the war in Chechnya.

The 2008 award for a domestic journalist went to *USA Today* reporter Toni Locy, for her coverage of the 2001 anthrax attacks. In 2008, Locy was held in contempt by a federal judge and fined after she refused to reveal the sources for her story.

The 2008 international winner was Chinese journalist Qi Chonghuai; he was recognized for his coverage of Communist Party corruption in Shandong Province. In 2008, the Chinese government charged him with “extortion and blackmail,” and sentenced him to four years in prison.

In 2009, the domestic winner of the award was David Rohde, a journalist for the *New York Times*. Rohde, who had previously received a Pulitzer Prize for his coverage of the war in Bosnia, was honored for his reporting on the war in Afghanistan. While in Afghanistan, he was kidnapped by the Taliban and held in Pakistan for seven months before escaping.

Also in 2009, the NPC honored Sri Lankan journalist Lasantha Wickrematunge posthumously. He was the founder and editor of the *Sunday Leader*, a paper that was highly critical of government corruption. Wickrematunge, who had previously survived an assassination attempt, was shot and killed in January 2009. Before his death, Wickrematunge had written an editorial about his fear of government plots against him; it was published posthumously.

In 2010, Charles N. Davis, a former journalist and associate professor at the Missouri School of Journalism, received the domestic award. From 2005 to 2010, David ran the National Freedom of Information Coalition, an organization devoted to promoting open government.

That same year, the NPC chose imprisoned Iranian blogger and human rights activist Kouhyar Goudarzi as the recipient of the international award. In December 2009, the Iranian government arrested him for the third time, and subjected him to harsh interrogations. In the press release announcing the award, the NPC called attention to the fact that in the aftermath of the disputed 2009 election in Iran, the country held more journalists in prison than any other nation.

In 2011, Lara Logan, the chief foreign affairs correspondent for CBS News and a contributor to *60 Minutes*, received the domestic award. Logan was honored for her reporting on the protests during the 2011 uprising in Egypt. While in

Anthony Shadid at the National Press Club in Washington, D.C., on March 1, 2007. Shadid won two Pulitzer Prizes and was posthumously awarded the John Aubuchon Press Freedom Award after his death in Syria on February 16, 2012.

Egypt, Logan was sexually assaulted by a mob in Cairo, and spoke publicly about her experience.

Also honored in 2011 was Al Jazeera's Dorothy Parvez. The NPC recognized her for her coverage of the Arab Spring protests; while reporting in Syria, she was detained by the Syrian Government for 19 days, and shared a jail with many political prisoners.

In 2012, James Risen, a reporter for the *New York Times*, won the domestic award. The NPC honored him for his coverage of national security affairs, including his reporting on domestic wiretapping by the Bush administration, as well as his stories about U.S. sabotage operations against Iran. For the 2012 international award, the NPC honored three journalists who died while covering the civil war in Syria. The honorees were Anthony Shadid of the *New York Times*, Marie Colvin of the *Sunday Times of London*, and freelance photojournalist Remi Ochlik.

In 2013, the NPC did not award the domestic prize to an individual; for the first time, it gave the award to a general category of people, namely "The Whistleblower." Specifically, the NPC sought to honor those who have served as anonymous sources for journalists; as the NPC press release noted, "without sources, reporters can't do their jobs and our democracy can't properly function."

That year, the international award went to Zeynep Kuray, a Turkish journalist who spent almost 18 months in prison after writing stories critical of the Turkish government. In the press release announcing the award, the NPC noted that Turkey had now become the country with the most journalists in prison, surpassing both Iran and China.

Judaism and Social Media

Social media have been embraced by most Judaic organizations because they have been heralded as key mechanisms by which Judaism will be passed on to the next generation. These technological advances in communication and their popularity, especially among youth, offer relief to those who worry about the dwindling number of Judaic devotees with each new generation.

The tremendous power of social media's various formats and forums are being harnessed to bring Judaism to any who desire it. One no longer needs to find a Jewish neighborhood or attend religious services to learn about Judaism or to commune with Jews. Judaic charitable and social groups were the first and are the most prolific users of social media in the Jewish community. They led the way in assimilating the latest communication forms into their campaigns for new members and donors. Now, many rabbis post their sermons on their temples' Web sites, and some rabbis use Twitter to send a daily message from the Torah to their Twitter followers, or to direct attention to relevant events happening locally, in Israel, or elsewhere in the world.

Participation

Social media also allow for dynamic and two-way conversations in real time that can involve a wide variety of participants from virtually any locale. This is a substantial and pervasive alternative to the usual top-down communication of Judaic principles and practices. Many Judaic forums and bloggers have large followings with religious discussions of all kinds among participants who sometimes vary widely in their degree of devotion to Judaism and a Jewish identity. Participants may also have great differences in terms of age, socioeconomic status, and geographical location. Moreover, a vast array of Judaic discussions can be found every day and at all times of the day online.

Although most welcome social media as a crucial mechanism for enhancing contemporary Judaic participation, a few concerns persist. Some worry that the focus on popularity in social media with continual counts of "likes" and "hits" has and will create Jewish "personalities," and these personalities may focus on self-promotion and their personal popularity, to the exclusion or detriment of effective Judaic messages and representations. Indeed, extensive self-focus is problematic because it contradicts the more introspective and community-centered approach reflective of Judaic principles. In addition, such personalities may offer or encourage especially provocative and radical positions on Judaic issues in order to enhance their popularity. In turn, by definition because of their popularity, more people are exposed to their messages than the messages of others, who may

offer more representative and thoughtful presentations of Judaism. This, though, is true of any subject matter available through social media. Just as the proliferation of Judaic-focused social media makes accessing Judaism easier than it has ever been before, social media are also likely to include inaccurate, superficial, and trivializing representations of Judaism.

Judaism is so prevalent in social media that it is represented in all social media genres, and includes active daily participation by thousands of people, including well-known and relatively unknown rabbis, life-long orthodox Jews, reformed Jews, non-Jews, teenagers, and people considering conversion to Judaism.

Upon posting their sermons to their local temple Web sites, well-known rabbis often receive responses to their sermons from people around the world. Their messages are available to people well beyond local attendees, and those who have been a part of a local temple can continue to connect with that group on social media, no matter how far away or how many times they may move. Anyone can experience an active and vital Jewish community, even if one does not live in a Jewish neighborhood because there are thousands of large and thriving Jewish communities that can be found and exist exclusively online.

Forms

One of the most popular and active Jewish blogs is Jewlicious. As quickly as Jewish bloggers make posts on this site, dynamic conversations about those posts ensue and often include a wide variety of participants. In fact, the founder of this blog, David Abitbol, resides in Jerusalem, while his colleagues who blog on Jewlicious.com are scattered about in Canada, Los Angeles, and New York.

Although Facebook is not yet 10 years old, nearly 1,600 Jewish and Israeli Facebook groups and fan pages exist. One fairly representative example of these groups on Facebook is IMPACT, an organization in Baltimore that creates and reports volunteer and leadership opportunities for the local Jewish community and those interested in Jewish communities in and around Baltimore. On its Facebook page, a message board is available for people seeking contact with Jews in Baltimore. People may be seeking assistance with

such things as finding a roommate, employment, or housing. The page also includes current Judaic-related events around Baltimore, and discussion boards on topics that sometimes lead to significant opportunities for participants with respect to education, business, and socializing.

Even Twitter, which allows only 140 characters per message, offers opportunities to advance Judaism in meaningful ways. For example, Rabbi Moshe Goldberger answers questions about the Torah and includes links to Judaic-related news stories from around the world in daily tweets from @GemsofTorah. Others tweet links to sermons of popular rabbis or embed links to Judaic-related videos.

Influencers

The Judaic presence on social media is so large and well developed that national Judaic organizations offer annual conferences centered exclusively on the use of social media, and some organizations celebrate individuals who have excelled in their Judaic presence on or contributions to social media.

In 2012, the National Jewish Outreach Program announced its inaugural recipients of the Jewish Treats: Top Ten Jewish Influencer Awards. Top on this list was Rabbi Yonah Bookstein, the executive director of an organization in Los Angeles designed for young Jews to become spiritually connected to something larger than themselves. He is also a popular blogger for Jewlicious and the *Huffington Post*.

The second person on this top 10 list was Lisa Colton, who founded Darim Online, a nonprofit devoted to helping Jewish organizations and leaders maximize their use of social media to achieve their goals. Goals typically include such things as community building, education, and fundraising.

Others on the list tweeted insights about happenings in the larger Jewish community, and one was a recent recipient of the New York Jewish Week list of “36 Under 36.” Another created the popular Web site “Jew in the City,” designed to create a positive view of orthodox Jews.

There are even rankings of the most influential Jewish organizations on Twitter in the United States. The Holocaust Memorial Museum (@HolocaustMuseum) in Washington, D.C., ranked first and the Israeli Consulate in New

York City ranked second on the list. Their Twitter account (@IsraelinNewYork) is a live feed of the everyday activities at the consulate in New York. Twitter followers can ask questions and make comments about activity there in real time, with dialogues about consulate activity occurring at the same time that the activity is happening. This is a new dynamic as Twitter followers of this group have the opportunity to contribute to and participate in the work of the consulate. This is citizen participation in government well beyond what people could have imagined just a few decades ago.

Conclusion

Because social media is already a part of the lives of so many young people, creating a substantial Judaic presence on social media has been viewed as essential and has been successful in increasing membership and participation in Judaic religious, educational, and social organizations. In addition, social media has been a tool for enhancing relationships between Judaic groups and fostering a vibrant Jewish community because of the large number and availability of such communities online. It has also changed the nature of Judaic education and participation for many who are now able to engage in a two-way, active debate and discussion about Judaism, an incredibly powerful, dynamic change that is thought to be especially attractive to youth. Social media has been a uniting, educational, and social facilitation force with respect to advancing the principles of and participation in Judaism.

K

Keystroke Logging

The keyboard, which is an important input device for computers, smartphones, and tablets, is also of high importance in terms of privacy. This is because identity thieves, cybercriminals, hackers, or others can monitor confidential writings, e-mails, chat conversations, and other forms of communication as users strike the keys of the keyboard. In 2008, 76 percent of identity thefts were performed by keystroke logging. Keystroke logging involves the secret monitoring of the activities of a keyboard as its keys are struck, regardless of whether it is a hardware keyboard connected to a laptop or desktop computer, or a virtual keyboard that is part of the software of smartphones and tablets.

Keystroke Logger Software

Keystroke logger software are programs that run in the background and secretly record all the text written by the users of a computer or mobile device. The recorded data can be accessed locally or remotely according to the keystroke logger software type. In general, there are two kinds of keystroke logger software.

The first kind of keystroke logger software is installed into a computer that is physically accessed. After installation, keystroke logging can be activated and deactivated by a local user

by pressing a secret key combination on the keyboard. The user who is administering keystroke logging on the computer can reach the secret and encrypted data file holding keystroke logs and view what the other users of the computer typed.

For mobile devices, software is first installed into a device accessed physically. After it is locally activated, it starts logging keystrokes, and sends the logs to the person administering the keystroke logging process, either by e-mail or file transfer protocol (FTP). Later, the keystroke logging process can be activated or deactivated by remotely accessing the device using the remote control panel of the software.

The second kind of keystroke logger software is downloaded over the Internet without a user's knowledge when they open an e-mail attachment or click a link on a Web site. It runs in the background and collects the user's private information and correspondence as they are typing on the keyboard. Later, it periodically sends the recorded keystroke history data to the identity thieves by e-mail or FTP.

The presence of any form of keystroke logger software usually cannot be detected, and remains invisible to users unless found by antivirus software.

Keystroke Logger Hardware

A keystroke logger, as a hardware device, is commonly attached to one of the USB or PS/2 (for

older computers) ports of a computer. It is the size of an ordinary USB flash memory device and resembles a keyboard cable or a keyboard cable connector between the keyboard and computer. When a user of the computer to which a keystroke logger device is attached starts to write something, the device secretly saves the key strikes of the keyboard to a text file on its internal memory, which is not accessible from the target computer. Later, the saved data on its memory can be reached by physically removing the keystroke logger device from the target computer and installing it onto another computer. Special software is then used to access the keystroke logger's internal memory.

Keystroke logger devices cannot be detected by antivirus software because they are physically out of the computer system, and therefore, they are inaccessible to the computer's operating system. Because keyboard cable connectors are generally located to the back of computers, keystroke logger devices attached between the computer and the keyboard may not be seen at first glance by a user. However, it is possible to detect these devices by means of a physical inspection.

Keystroke loggers are an important tool of cybercriminals, hackers, or identity thieves, but in some cases, a parent who wants to track a child's activities, for example, may also use this kind of software or hardware device. In order to be protected from keystroke logging, computer users should use antivirus software and firewall preventive strategies and frequently check whether these are up to date. Second, they should think twice before opening e-mails from unknown or untrustworthy senders, or clicking unknown links. Finally, they should check whether there is an extra device attached between their computer and their keyboard connector.

Klout Score

A Klout score is a single number that represents an aggregation of multiple pieces of data used to measure a social media user's influence across his or her preferred social networks. Klout, the company that creates Klout scores, analyzes data from Twitter, Facebook, Google+, LinkedIn, Foursquare, YouTube, Instagram, Tumblr, Blogger, WordPress, Last.fm, and Flickr, and uses the data to craft an individualized, numerical score for each user of their service. In creating Klout scores, Klout measures the amount of personal contacts in a network and the regularity of content creation, and analyzes the interaction that content receives from other users. Klout provides a score range from one to 100, with 100 representing the highest amount of possible influence.

Klout assesses a variety of variables in crafting its algorithm, but does not publicly share its exact process of arriving at the Klout score. Responding to the question of how scores are derived, Klout says that it sees influence as the ability to drive people to action, thus making replies and retweets the most important factors in high Klout scores. Historically, Klout scores have been represented using three pillars, which Klout has referenced as true reach, amplification, and network impact.

True reach references the number of people the social media user influences. Klout filters out spam and false placeholder accounts to focus on the people who are acting on the shared content.

When users post messages and people tend to respond to the information, users tend to have higher scores. Amplification is how much a social media user influences other users. When a message is posted this category, the analysis looks at how many people respond to it or further spread it. If people act upon users' content, they often have a higher amplification score. Network impact references the influence of the people in the users' true reach, or how often top influencers share and respond to content created by a user. The more highly influential members that share a user's content, the higher the corresponding network impact score.

Methodology Changes

Since Klout launched in September 2009, the company has had many objections raised toward the methodology of crafting Klout scores. Specifically, critics like Alyson Shontell, who writes for *Businessinsider.com*, have pointed out that Klout scores are not representative of the influence that a person really possesses. Shontell highlighted that Barack Obama, president of the United States, had a lower influence score than a number of bloggers. In August 2012, Klout changed how it accumulates the data, and now President Obama commands a 99 Klout score. Klout has switched from originally assessing 100 variables to now looking at more than 400 criteria in evaluating the assigned score. Overall, Klout currently assesses more than 12 billion data points per day across the seven social networks to apply score ratings to all social media users. More than 100 million users had Klout scores as of 2012.

Klout's remaking of the Klout score formula removed the longstanding breakdown of true reach, amplification, and network impact, and created the concept of Your Moments. The Your Moments feature within Klout allows specific engaging social media activities to be highlighted. Your Moments allows users to view their own and other users' social media impact and interactions. Klout also introduced a direct list of Your Influencers. Your Influencers looks at social media users who are leading conversations in areas where the Klout user specifically interacts. Finally, Klout introduced the concept of Your Influential Topics to provide concise understanding of main areas of conversation.

Your Influential Topics are represented by keywords around which the Klout user's main social media interactions revolve. The cumulative focus on Your Moments, Your Influencers, and Your Influential Topics is meant as a tool to increase participation in Klout, understand how users can better utilize social media, and provide ways for users to increase their Klout scores.

Commercial Applications

Klout scores and associated Klout influencers have become tools for businesses and companies to seek out Klout users to whom they wish to provide incentives, or Klout perks. Klout perks involve opportunities for Klout users with specific Klout scores to have access to certain experiences and products and to receive discounts from businesses. Leveraging Klout scores for business purposes is increasingly on the rise. The automotive company Audi invited top design, technology, and luxury influencers to test drive the new Audi A8 at exclusive Klout-directed events, with some Klout perk members receiving all-expense-paid weekend trips with the car. Similarly, Universal Pictures invited top Klout entertainment influencers to screen the movie *Adjustment Bureau* before it was released in theaters. Hewlett Packard offered Klout top film influencers HP laptops preloaded with the top films from the Cinequest film festival.

As Klout scores become more widely accepted and utilized by an increasing range of companies such as hotels, call centers, and department stores, the importance of this numerical representation is bolstered.

Many companies and customer service organizations are integrating Klout scores in their service protocols to determine how specific and detailed their approaches to serving the individual customer should be. Klout scores are already thought to possibly create shorter call wait times to speak with customer service, nicer hotel rooms, and better deals on clothing, all of which center around companies wanting to provide powerful Klout score holders, who are thought to have a more powerful digital presence, a positive experience. The integration of Klout scores with social media services and aggregators such as HootSuite and TweetDeck, which are used by nearly all 100 of the top Fortune 500 companies, have made

the experience of utilizing the scores much more prominent and easy to conduct on a large scale. Also, as Facebook and Twitter are increasingly used to sign on or into other digital services, the ability to track and have access to a digital user's complete social media profile, and in turn, his or her Klout score, is easier to manage.

L

Latin America

Citizenship participation in Latin America through social media is the result of a long and continuous process of social alienation of communication technologies. This has marked struggles for the region's democracy because of a lack of visible channels of a proper system and sometimes because of the monopoly of the analog and digital media mainstream. The dominance of the private sector and the integration of audiovisual media controlled by the major transnational telecommunications operators map a media scheme that is not favorable to the interests of the population and to open channels for a public and representative dialogue.

Though in the past decade, the change in the regional political map has brought about the development of public media and access to certain rights for citizens, the common pattern is the lack of a democratic public sphere and a sufficiently solid institutional system, eventually weakening the continuous efforts of some states to develop and intensify cultural democracy. This is to a large extent the result of the sociopolitical structure of corporatism and underdevelopment that have dragged down the national history of most Latin American countries. In this regard, United Nations Educational, Scientific and Cultural Organization (UNESCO) pluralism and democracy indicators

confirm important democratic deficits in most of these countries, considering that a media system is defined by a low level of newspaper circulation and a high dependency on the television system. A continuous private and oligarchic implementation of journalistic information remains, and the government makes use of public media, while press reporters experience a limited development of professional autonomy. It is within this framework that social media reach their projection and importance as alternative informative media or channels.

Manuel Castells dates the centrality of these emergent political communications, typical of the new society network, in 1994, from the Zapatista Army of National Liberation's (EZLN's) Zapatista uprising in Chiapas, Mexico, to represent a double split, both symbolic and media-related; however, two events coincided. On the one hand, the North American Free Trade Agreement (NAFTA) came into force, an antagonist critique to the economic and trade integration model; on the other hand, the reality of the indigenous population was made visible to the Mexican media space, the former historically excluded from the cathodic mirror, despite the revolutionary imaginary that inspired the Constitution of the United Mexican States in the early 1900s. In addition, the war in Chiapas was not actually an Internet war.

The era of social networks and political battles in cyberspace took place in the region from that date, as the EZLN later organized the First Intercontinental Encounter for Humanity Against Neoliberalism (1996). It set up for the first time in the public agenda of global movements in the region the role of social media and resistance levels against capitalistic globalization. From Seattle until today, the Zapatista effect projects with the mobilization of Mexican youth's Yo Soy 132. They engage in new practices and ways of political citizen articulation against authoritarian regimes form a new perspective of the McBride spirit and the cultural rights of the Latin American cultural citizenship, matching the configuration and nature of the new ecosystem of dispersed information and knowledge networks devised from the south and from the bottom.

From 1994 until today, the new social media not only have strengthened community integration schemes and mobilization in the subcontinent, they have also widened the forms and extent of citizenship participation within the population. These interactive networks have contributed to radically transform methods of sociability, and have also gradually deepened the institutional basis of the centralizing and hierarchical mediation model of social representation of companies, such as Televisa (Mexico) and Globo (Brazil), archetypical models of the hierarchical system of control of images and public speeches in the region.

Political Ramifications of Social Media

As a result, from the memory of practices and experiences of cultural subversion and resistance, social movements and progressive political forces in countries such as Mexico, Chile, and Colombia have experienced new social mediation processes led by new generations of digital citizens willing to alienate social networks and challenge the hegemonic place of traditional information media. As such, the motivation of productive know-how for the use and alienation of new technologies has encouraged in the past years new transformation processes of the public sphere that permeate and question the agenda setting of mainstream media. For example, civil organizations Brasil Menor and Brasil Vivo link their emancipating willingness to movements such as Los Indignados in Spain, stating how Occupy Rio or Occupy São Paulo

involve the process of accelerated modernization that Brazil is going through with the Internet and social networks. On the other hand, initiatives such as the REDISTIC network and the MISTICA project, as well as the Communication and Citizenship Forum, have highlighted the emergence of new processes for access and participation with new technologies from a peripheral and alternative approach, aimed at building both a community and citizenship.

Thus, the broad experience accumulated in the region from the 1960s in terms of participative communication and local development drive the processes of empowerment in the digital culture of social media, whether by means of telecenters or battles for the land of indigenous movements. Technological innovations and the resourceful Internet as a system of communication for social change constitute a constant factor throughout the subcontinent today, as several reports compiled by the Latin American Information Agency have proven. In its study "Theory and Practice of Research and Intervention in Social Communities and Organizations," Eduardo Vizer documents the proliferation of numerous processes of creativity and political struggle in cyberspace in the past decade. Likewise, the project *The Internet, Digital Culture and Hegemonic Culture* of the Gino Germani Institute at the University of Buenos Aires illustrates how the Internet is today's main venue for struggle for political actors in the region, proving significant transformations in the strategies, political intervention, and construction of new subjectivities to generate collective identities in the digital era.

Despite this, however, Latin American countries live immersed in the analog era, with audio-visual media communicative structures highly concentrated and still determinant, which in practice can be interpreted as an economy of cultural industries totally dependent on consumerism and the conditions defined by the international division of cultural labor. Few comparative studies regarding the information structure in countries of the subcontinent show the persistence of an oligopolic, restrictive, and unbalanced structure of communication, with little or null margin for political, ideological, and cultural plurality. This explains to some extent the destabilizing consequences of regulation processes in the region,

from a media coup d'état (Venezuela, Grupo Cisneros), to the pressure and campaign of discredit (Argentina, Grupo Clarín), to the judicial process and black propaganda against the presidency of the government (Ecuador, El Universo). The latter illustrates the regulation process that has taken over two and a half years, confronting the lobby of the private journal industry that dominates the national market.

The social communication bill, for the first time in the history of Ecuador, puts forward a democratic model for equal distribution of frequencies (33 percent for public media, 33 percent for the private sector, and 34 percent for the third sector and community media). It has been subject to criticism from private operators, whose biased claims state that the proposal is a raid against freedom of expression, with various arguments that range from considering community media as pro-governmental, to identifying the regulating state media council as an a priori censorship court. They also defend the private rights of the concessionary companies that will have to renounce a portion of their assets to fulfill the new structure of distribution in radio frequencies. The bill, one of the most advanced of its type, along with the Argentinean regulation, will rebalance the voices and actors that access the public space, reinforcing the production of local content (40 percent of the production must be national, and 10 percent independent) and suppressing private monopolies common in some parts of the country. Because of the paradoxical situation of mediation within the sector, the initiative has even become the axis of the struggle for law and hegemony during past legislature, in an environment full of national political confrontation.

Traditional journalism is at a crossroads in most Latin American countries. The fact that progressive governments took office in certain countries in the region in the early years of the 21st century steps out of the box in terms of configuring the relation of forces. In this process, private communication media, already distant from the mere role of a controller of democratic institutions, strongly embraced their political performance, using highly propagandistic and corporatist speeches, and were eager to take the political word from various national governments. Thus, according to Orlando,

. . . mediatic communication has become a really political battlefield where different actors fight for the construction of hegemonic directions over the model of the state and democracy. Actually, in recent years and in different countries, the open disputes between media companies and national governments have become one of the most important issues of political conflict within the context of reformed states.

The paradox of this situation, therefore, apart from reediting what has been experienced with the McBride report in most of the Latin American countries, is that above all, the processes of democratization remain focused on journal content. This ignores the cyberculture sphere of autonomy and citizen empowerment processes on the network, while the colonization of virtual space, the cloud, by Google, Apple, Microsoft, and the nearly absolute control of the telecommunications networks by quasimonopolistic companies takes place, as occurs in Mexico with Carlos Slim.

Meanwhile, the network requires both a protagonist role in electoral processes, as in the last presidential campaign in Mexico, or in the projection of revolutionary figures such as Hugo Chavez or Rafael Correa. The example of global projection of the Chilean students' movement in media and platforms such as @Movilized2011 show the practices and importance attributed to new political actors in the region. An example in this regard is the process experienced by the indigenous movement.

Cultural Diversity

Latin American culture is made up of a symbiosis and diverse colonization processes, migrations, and mestizo races that determine a conflictive, but liberatory political framework of cultural diversity in media. In communication intervention practices, the wealth and contributions, both material and symbolic, of this common history nourish different cultures and identities. These are also original because they open the door to communication channels with other civilizations, and are potentially autonomous in their capability of projecting new content and codes of representation, and of politicizing access to the world of minorities, such as indigenous peoples. The original syncretism

that has imprinted the local histories of the sub-continent and that is the result of diverse mobilities and long historic changes thus evidences an insufficiently explored potential in the public policy agenda. This includes understanding the confluence and crossroads of pre-Columbian and migrant cultures, the production of multiple mediations and creative hybridizations in the rise of a possibly different modernity that is sensitive to this rich diversity, even more important in the era of proliferating crowds that continue to emerge with the use of digital networks.

The difference would constitute a social capital of indispensable reference in the creation of a constitutional power and the possibilities of regional development when articulating new

ways of change and organization of the symbolic capital in cyberspace. Hence, in the era of creative economy, the value of diversity has been built on condition of an expansion and contemporary economic development, on the foundation to generate immaterial and intangible values for the sustainability of native cultural economies and ecosystems. Despite progress on the regulation of the informative system and the right of access of indigenous minorities, the political and regional public agenda marginalizes the role of a public stakeholder of the native peoples when discussing modernization processes in the Internet galaxy. In some cases, this situation, as in Colombia, Chile, or Mexico, is unsustainable, but new spaces and changing times have been envisioned

Indigenous children from Isla del Sol in Lake Titicaca in Bolivia in 2005. Indigenous people have the potential to affect the ways in which Latin American cultures use social media. The average consumption of social networks in Latin America, at 7.5 hours a month, is already higher than that of North America (with nearly six hours per month), and the European Union (at seven hours per month).

in the past two decades, which continue inspiring the need to rethink contemporary ways of political communication.

From Chiapas to Temuco, from the Pampas to the Amazon, from the Intercontinental Encounter Against Neoliberalism to the Second Continental Summit of Indigenous Communication of Oaxaca in Abya Yala (2013), the indigenous peoples' movement of struggle has gained strength and articulating power in its fight for the land and culture. The example of the Mapuche people in Chile is illustrative in this process of cultural challenge and resistance that today contributes to legal recognition in the informative system in most of the Latin American countries of social media managed by citizen organizations. Because of its historic weight and importance in the public function of regional communication, these communitarian channels constitute a relevant political stakeholder in the new landscape of transformation of the political and communication system in Latin America. It links audiences with the public sector, fueling the innovation and development cycle, and giving support to supranational projects, as is the case of Telesur.

This virtuous circle begins to be projected in policies such as the Culture Spots Program in Brazil that opens new logics of empowerment and citizen participation on a local basis. One of the advantages of Latin American countries in their alienation of information and communication technology is the population pyramid. The average consumption of social networks in the region surpasses that of Africa, the Middle East, Europe, and North America. Therefore, while in Latin America average consumption is 7.5 hours a month, in North America it is nearly 6 hours, and 7 hours in the European Union. In the era of TV screens, Latin American youngsters, as shown by studies on migration, develop creative ways to alienate digital culture. In spite of the persistence of important generational gaps that affect schools, governmental institutions, and/or family life, phenomena such as the Yo Soy 132 movement or the March of the Penguins (Chile) lead to the emergence of new modes of consumption and representation that should be considered in the analysis and understanding of the political transformations that countries such as Mexico and Chile experience.

Envisioning a new framework of displacement and discursive and representational transitions assumes the emergence of a new political culture that evidences the process of constitution of a new subjectivity, of a new citizenship open to dialogue and debate, to the collective discussion and decision with more capabilities of autonomy and empowerment. New generations, and in part women and minority groups, tend to develop new ways of articulation and public projection as stakeholders in Latin America. Therefore, the digital revolution aims at a new logic of interaction that correspondingly demands new policies in everyday life. School and family are important, and there are still unsolved problems usually ignored by experts when talking about the socialization of new technologies and their social appropriation. These include the inexistence of public policies adapted to emergent ways of organization to then continue to new ways of representation and assemblage of domestic culture, and other circuits of social representation and production, despite the propaganda of projects such as the Digital Agenda (Chile), Edusat (Mexico), or Online Government (Colombia).

Moreover, the Association for the Progress of Communication has supported projects such as COMUNICA to implement social networks seen as citizen convergence platforms with a view to influence public policies in countries like Ecuador, Peru, or Uruguay. In order to do so, the demand of new politics in communication stresses the need of new governance in terms of the Internet in the region. Since democratic progress in the digital culture is facing the private boundaries, blockades, and alienation of a cultural policy limited by the transnational interest to manage intellectual property rights.

Conclusion

If the problem of communication and culture is fighting for the code, the alienation of the immaterial for the common cultural heritage that is also subject to intense exchange, the recognition of self-examination and of the diverse forms of self-production (the *favelas*, the informal tertiary sector, of the freedom to circulate online, claimed by new political actors in the region), it may guarantee a public sphere that recognizes the productive dimensions of citizens and collective interests

in front of the traditional model of accumulation and alienation of cultural assets. Beyond the state and the market, not questioning the patent system and intellectual property rights is detrimental to the possibility of a social contract necessary to exercise cultural rights in the region. Most Latin American countries have not devised political alternatives in their strategies of positioning; instead, they have fulfilled the demands of the WTO and Anglo-American standards of trade exploitation in the digital network sector, even though they are against their interests.

media a “fourth estate,” with stature equivalent in the social order to the “three estates of the realm”: clergy, nobility, and common people.

In the United States, the founding fathers believed that the power of the press was so essential a guarantee in fostering a democratic society and helping citizens to curtail abuses from the powerful that they added the right to a free and open press in the Bill of Rights in the First Amendment of the U.S. Constitution in 1791. Thomas Jefferson said,

Our first object should therefore be, to leave open to him all the avenues of truth. The most effectual hitherto found, is freedom of the press. It is therefore, the first shut up by those who fear the investigation of their actions.

Today, the media are considered informally as a fourth branch of society with the president, Congress, and courts, whose history has been intertwined with politics since the founding of the United States. In the 19th century, pamphlets and newspapers were often raw, partisan political tools supported by the wealthy, literate elite who took out subscriptions and made donations to support like-minded publishers. Historians cite Thomas Jefferson’s successful presidential run in 1800 as the first modern political campaign. He personally underwrote several newspapers during his race against John Adams. The news reports were as rough and tumble as any modern campaign, with issues of race, religion, and sexual indiscretion, along with political issues of the day.

The 19th-century inventions of the high-speed press, typewriter, linotype, photography, photoengraving, and telegraph helped improve the presentation and delivery of newspapers and propelled them into a modern mass medium. An outgrowth of this innovation was the penny press, cheap newspapers, filled with populist, sensational fare that drew a large working-class audience. Advances in printing presses and improvements in photoengraving and photography allowed newspapers to easily incorporate visuals, which also helped spur the evolution of the advertising industry and the craft of photojournalism. The invention of the telegraph led to a cooperative of newspapers to share reporting resources and the development of the Associated Press.

Legacy Media/ Old Media

Edmund Burke, an 18th-century British parliamentarian, is cited as the first to acknowledge the power of the press when he deemed the news

Rise of Mass Media

Legacy, or old media, are defined as newspapers, radio, television, magazines, and books. Some would also include movie and music studios, as well as the advertising industry. The daily newspaper began to face competition when radio became popular in the 1920s, and television in the 1950s. The spread of radio coincided with the political fortunes of President Franklin Delano Roosevelt in the 1930s, who used it as his bully pulpit to rally a nation battered by the Great Depression. The four-term president used the new technology to conduct nearly 1,000 fireside chats. Roosevelt's relationship with the press was so close that, even though many news editors were aware of his physical limitations and health problems, they never reported on his infirmities.

By the 1950s, television was becoming the most popular medium for news and information. This led to increased competition for the advertising business. Because newspaper publishing and distribution were expensive, and paid subscriptions did little to cover the costs of publishing, not only were newspapers competing against television for audience, but they were also competing for advertising when some advertisers realized that television was more effective in delivering their messages. At the same time, television became the primary medium for political ads. By 1960, nearly 90 percent of U.S. households had televisions, which allowed then presidential candidate John F. Kennedy to use television to politically devastating effect against his rival Richard Nixon in a series of widely watched, televised debates. Kennedy was also helped by a multimillion-dollar advertising campaign that tailored his ads for a television audience.

The rise in television presaged the newspaper circulation declines in the 1970s, while changes in monopoly law led to a greater concentration of ownership in both print and broadcast media outlets. In 1972, the laissez-faire relationship between presidents and the press came to a dramatic end when the *Washington Post* covered a break-in at the Democratic National Committee headquarters in the Watergate Hotel, which led to the resignation of President Richard Nixon.

New Media

By the late 1980s, all media began undergoing changes as a result of the rise of the Internet. Some

newspapers began to experiment with innovative interactive communications technology, such as videotext and the use of modems to transmit information. The rise of America Online (AOL) in 1989 heralded the influence of the Internet and the pressures that would disrupt traditional media. As one of the first Internet service providers (ISP), AOL grew from 200,000 to 6 million subscribers from 1992 to 1996. At its height, the service had 30 million subscribers. In 2000, it acquired old-media titan Time Warner in a disastrous merger that precipitated the decline of the fourth estate.

Amid this climate, the traditional role of the journalist became marginalized by the proliferation of “pseudo-journalism,” according to John S. Carroll, a former editor of the *Los Angeles Times*. Carroll called the spread of faux journalism a troubling development because people who resembled journalists were manipulating, rather than informing the audience. Politicians have taken advantage of this new era to bypass what former President George W. Bush once called “the filter.” In addition, financial and other pressures at some news organizations resulted in ethical and professional lapses—plagiarism and falsehoods in reporting—that heaped scorn on the profession, sapping its credibility and creating a more cynical readership.

Subsequently, people have become more skeptical about what is reported in the news. In fact, the Pew Research Center for the People and the Press said that only about one-third of people say they believe what is reported by the 14 largest news organizations. The perception does not bode well for traditional media as more people are willing to go elsewhere for news deemed more reliable, even it means that they must create it themselves through blogs and social media.

Blogging, first introduced in the late 1990s, was a tool for personal journaling. Now, the availability of easy-to-use blogging software has meant that bloggers are covering their communities and fact-checking professional journalists.

The Internet began to play a bigger role in political campaigns. For example, Democratic Senator Diane Feinstein of California was credited with launching the first campaign Web site in 1994. John McCain was among the first to use the Internet to raise money in online donations. By

the 21st century, technology has made publishers of anyone with a computer. By 2002, more voters turned to the Internet to find political information. In 2004, social networking sites began launching, and political campaigns began to recognize the growing clout of bloggers. For the first time, many were issued credentials to cover the Democratic and Republican conventions.

The 2004 presidential bid of former Vermont Governor Howard Dean set the stage for the strategies adopted by Senator Barack Obama in his presidential run in 2008. Dean encouraged bloggers to generate voter interest, as well as to recruit and to motivate volunteers. Despite a lack of sufficient funding, Dean's strategy of Internet-based fundraising and grassroots organizing revolutionized the political campaign.

By 2008, the number of people getting their news and information from social media more than doubled, according to a Pew study. More politicians began incorporating the use of social media tools like Facebook, Twitter, YouTube channels, and blogs to connect with their constituents and to challenge opponents. Financial pressures began to weaken not just print news organizations, but also the broadcast-centered model of political communication. Following Dean's example, Barack Obama, a former community organizer, bypassed traditional press to develop a database with millions of names, e-mail addresses, and phone numbers of people who could instantaneously be reached and engaged. At the time, Obama had nearly 2.4 million supporters on Facebook. His rival, Senator John McCain, had 620,000. On Twitter, Obama had about 112,000 followers to McCain's 4,600. On YouTube, there were more than 18 million channel views for Obama, compared to 2 million channel views for McCain, according to Pew. In 2012, Obama's database and a strong get-out-the-vote campaign led many in the press to underestimate the strength of his support against Republican challenger Mitt Romney.

However, some scholars say the retreat of legacy media has had a detrimental impact on the democratic process. In the recent past, newspapers would reprint the entire text of important political speeches. Today, the *New York Times* is one of the last newspapers to do so. Declining news coverage has resulted in 25 states having no

full-time reporter who covers Capitol Hill. Despite the perceived decline of legacy media, a 2011 University of South Carolina Annenberg/*Los Angeles Times* poll on politics and the press found that most voters still turn to traditional sources—television news and newspapers—for information. Also, traditional media remains more trusted than blogs, late-night comedy shows, and social media networks.

Lesbian, Gay, Bisexual, and Transgender Rights

Social media can best be defined as forms of electronic communication such as social networking and microblogging Web sites that are used to create online communities that share information, videos, and personal messages, and have become increasingly influential for a worldwide audience.

Some of the most influential and best utilized include Facebook, Twitter, YouTube, Myspace, Skype, LinkedIn, and Tumblr. More than 50 percent of people learn about breaking news via social media versus traditional news venues. This growing forum for information, play, and political advocacy yields a powerful source of influence, with significant relevance to lesbian, gay, bisexual, and transgender (LGBT) issues.

LGBT rights are a source of controversy among those who are personally included within this group, are supportive of LGBT people, or are against anything beyond traditional gender roles and sexual orientation. Social media allows anyone to support or denounce anything, simply by posting, reposting, or commenting using venues like Facebook. This is the primary news source for many about issues related to federal, state, local, international, religious, psychological, medical, spiritual, and natural disaster news and resulting policies of social acceptance or rejection.

Facebook now counts over 800 million active users (11.5 percent of the global population). It tracked 71.7 million U.S. Election Day–related comments in 2012. Facebook has a safety page, which went purple on Safety Day, October 12, 2012, when millions wore purple to speak out against bullying in support of LGBT youth. This Facebook initiative is “liked” by 907,273 members. On June 3, 2012, the Gay and Lesbian

College students brought together by the Souforce Foundation protest the “Don’t Ask, Don’t Tell” policy by holding a sit-in outside of the U.S. Armed Forces recruiting office in Times Square in New York City, September 2006.

Alliance Against Defamation (GLAAD) presented Facebook with a Special Recognition Award related to bullying prevention and LGBT inclusiveness. Twitter, an online social networking and microblogging site, allows individuals to send messages to followers in 140-character tweets. Twitter supports self-expression and does not censor its members. This means that the variety of LGBT feeds (accounts) and tweets (messages) can range from the most supportive to the polar opposite about any issue, each side potentially misinforming or enlightening followers. Twitter is often the first social media source to broadcast immediate news, such as the U.S. Supreme Court’s decision, on December 5, 2012, to rule on two gay marriage cases.

Lightening-swift Twitter communication spreads across the Twitterverse.

LGBT youth, vulnerable to social and family pressures, can become overwhelmed, resulting in self-harm, attempted suicide, or death. A Social Outlet provides LGBT youth with connections to virtually every social media type, offering validation and linkages between isolated and at-risk young people who feel no reason to live, giving assurance of their value and supportive social resources. An increasing number of organizations are using social relationships on Facebook to involve increasing numbers of members who support social issues to engage others to fundraise and vote.

Global Voices provides a forum for international bloggers and includes an English-language resource regarding gay rights. Postings promote awareness of LGBT issues across the globe. Amicus, Latin for “friend,” assists organizations in expanding its member base using the Amicus link to have supporters invite friends to learn about and act on behalf of causes. Friends and family are more likely to respond to personal, versus random e-mailings or advertisements. Various LGBT organizations, including the Human Rights Campaign (HRC), have used Amicus with great success. The Bilerico Project is the Internet’s largest lesbian, gay, bisexual, transgender, queer, and gender queer blog site, with a host of carefully selected bloggers who are leaders and experts providing unique perspectives, news, and/or personal commentaries.

Social Media Evolution and LGBT Rights

Delia Lloyd highlighted important social changes regarding relationship status on Facebook, already creative beyond the scope of traditional U.S. census categories, with the inclusion of “In a Relationship” and “It’s Complicated.” “In a Civil Union” and “In a Domestic Partnership” were added in 2012. Such changes allow couples, in particular homosexual unions, to be represented with specificity in ways not previously available on this or any other social forum, as far-reaching geographically and by membership scope. These Facebook postings allow friends to identify LGBT connections with relevant news about legal challenges and limited rights reserved for heterosexual married couples via postings or other

news sources. While this Facebook status change pleases members, it also added political weight to important issues in a changing political and social realm. LGBT consulting organizations involved in these changes included: HRC; the Gay, Lesbian, and Straight Education Network; and the Gay and Lesbian Alliance Against Defamation. Facebook’s participation in the expansion of one’s ability to define relationship status was on the side of expanding gay rights.

Christina Sirabella notes the impact of increased issue exposure via social media. The more a social issue is discussed, the more awareness individuals have regarding relevance within an evolving society. Such opportunities provide individuals with private and unique forums through which they can explore different opinions. Social media provide mechanisms for the support and effectiveness of LGBT organizations, including HRC, the NOH8 Campaign, and the Trevor Project. Sirabella provides examples from YouTube that allow individuals to be themselves, at whatever stage in their self-identity/disclosure process, including supportive forums for allies to share messages on the It Gets Better Project. Facebook and Emoji have created icons for same-sex couples.

Federal law provides 1,138 rights and protections based on marital status. These rights are not available to couples in same-sex marriages. The HRC is using social media to make this information known. Some key rights denied married same-sex spouses include Social Security recognition, family eligibility survivor benefits, inheritance taxes, as well as taxes on employer-provided health benefits. The idea behind these campaigns is to eliminate the perpetuation of different classes of social rights, which is contradictory to the U.S. Constitution and human rights according to the United Nations’ bylaws.

Social Media Advocacy

Social media has provided an almost instantaneous venue for any type of social movement and message. Consider the Chick-fil-A backlash when the company president offered his support of families as those defined by the Bible. Offended customers and observers took to Twitter, Facebook, and YouTube to encourage social awareness, pressure for change, and a boycott of the fast food chain. North Carolina endured a media blitz before,

during, and following the May 2012 passage of Amendment One (a gay marriage ban). All Out is an international LGBT rights movement that utilizes many social media tools. This group, led by brave individuals risking their lives in different countries, has mobilized many through social media to create social awareness to protect LGBT communities from government-sanctioned violence, and even death. Since establishing itself one and a half years ago, All Out has organized efforts in 50 countries. Friendfactor.org is an organization for family and friends of gay individuals who can provide support in a method similar to the “like” function of Facebook. Friendfactor.org is considered a contributor to the success of legalizing gay marriage in New York State. Anyone can start a page, gay or straight, to engage friends to support issues important to them. If someone receives a personal request, Friendfactor offers an easy mechanism to provide the state legislator’s contact information, as well as a recommended script regarding the specific issue.

Opponents of LGBT Rights

While social media has been used to advance the rights of the LGBT community, many opponents similarly advance their agendas. Westboro Baptist Church (WBC), via its Web site and Twitter, promotes its anti-gay agenda. Among other protest issues, WBC has demonstrated at the funerals of gays, churches that perform same sex marriages, and many other LGBT events. Dave Agema, Michigan’s Republican National committeeman, posted a copy of an online article on his Facebook page: “Everyone Should Know These Statistics on Homosexuals.” A strong social media showing by Michigan Republicans condemned the outdated 1970s statistics that suggested that gays and lesbians are dangerous. Republicans throughout the state, while reiterating their support of traditional marriage, found that the article promoted hate and discrimination, which was not a party value. Agema was encouraged to resign, while others in his party worked to distance themselves from him and his positions.

France legalized gay marriage on April 23, 2013; the move, while celebrated by many also met with homophobic backlash. By that evening, Twitter was used to protest with hashtags #MortAuxGay (“death to gays”) and #ilfauttuerleshomosexuels

(“we must kill all gays”), following months of conservative opposition. Printemps Français (French Spring) has a Facebook group supporting anti-gay marriage demonstrations. Blogs, news sources, and other social media provide updates about Printemps Français, which is also linked with fascist and other splinter groups.

On May 17, 2013, thousands of anti-gay activists in Georgia attacked peaceful participants of an International Day Against Homophobia and Transphobia. The disruption was led by clerics, and 30 people were injured. As a result, an anti-gay game went viral on Facebook. The goal of *Call of Taburetka* is to maneuver a priest to wield a stool against LGBT activists, as happened on that day. As of May 29, 2013, the game received 26 Facebook “likes” and many critical comments.

Social Change

California’s 2008 Proposition 8, anti-gay marriage amendment, would have been minimally known beyond state borders, absent the social media frenzy that brought much attention. It was supported by a state vote, amending California’s Constitution by defining marriage as only between a man and a woman. The amendment was in response to the California Supreme Court’s early ruling that same-sex couples have a constitutional right to marry. During this window of on-again/off-again permissions, some same-sex couples married, and these marriages were left standing, even after the passage of Proposition 8. The power of this representative case, in one of the most progressive U.S. states, led to the 2010 U.S. District Court’s ruling to overturn Proposition 8 based on the lack of due process and equal protection under the U.S. Constitution.

The Ninth Circuit Court of Appeals supported this decision upon appeal; the case is now up for consideration by the U.S. Supreme Court. If the U.S. Supreme Court takes on the case, it will face the scrutiny of public opinion and awareness of the changing climate in a more accepting society that elected President Barack Obama for a second term, whose platform included support of gay marriage. Social media outlets will provide much food for thought to the higher Court and others regarding the balance between interpretation of the U.S. Constitution and the values of a living and breathing society that voted to permit

gay marriage in three additional states during this same election cycle.

All Out campaigns included mobilizing 20,000 in several hours in Sofia, Bulgaria, in 2012, to counter a church-sanctioned call to stone gay pride parade celebrants. In Uganda, 500,000 online signatures contributed to enormous global pressure to stall a national bill to “Kill the Gays.” A rampant online campaign to gather 250,000 signatures stopped a “gay gag rule” in St. Petersburg. The Fédération Internationale de Football Association (FIFA), the governing body of international soccer, opened an investigation into the Nigerian Football Federation’s commitment to kick out any suspected lesbians from the national team. All Out exceeded its 40,000 online petition signature goal by nearly 10,000. In Iraq, All Out collaborated with the Iraqi Refugee Assistance Program via online petition and fundraising efforts to smuggle to safety young gay women and “emo” men who were experiencing brutality, and often death.

Social media addresses political issues affecting people; it helps instantly identify the will of the masses through online petitions, fundraising, mass demonstrations, and protests, determining who will get the lion’s share regarding rights or benefits, and who will live or die. LGBT lives have been saved in Iraq, and celebrants have been saved in Bulgaria from church-condoned stoning at a parade. Legislation is monitored by an increasingly informed and demanding public regarding LGBT civil rights as social rights. Those who feel abandoned or isolated, like LGBT youth, can reach out to someone like themselves, or an ally who can offer a supportive hand, via a social media site. These are some reasons why social media and their effects on the politics of LGBTs are so vital.

Liberation Technology

Lying at the intersection of social science, computer science, and engineering, the Program on Liberation Technology at Stanford University examines how information and communication technologies (ICTs)—including mobile phones, text messaging or short message service (SMS), the Internet, blogging, global positioning systems (GPSs), and other forms of digital technology—are used to promote freedom and democracy, defend human rights, improve governance, foster development, and pursue a variety of other social goods. The program is hosted by the Center on Democracy, Development, and the Rule of Law at the Freeman Spogli Institute, in collaboration with the Program on Global Justice, the Hasso Plattner Institute of Design (d.school), Stanford Institute for Innovation in Developing Economies (SEED), and individuals from a variety of schools and academic departments at Stanford.

The Program on Liberation Technology at Stanford University is motivated by the explosive growth in ICT usage to nurture grassroots activism, fight corruption, deter electoral fraud, expose government wrongdoing, empower the poor, protect the environment, educate consumers, and improve public health, among others. The program examines the technical, legal, political, and social obstacles to the wider and more effective use of liberation technologies, and how these obstacles can be overcome. It also tries to evaluate (through experimental and other empirical

methods) which technologies and applications are having the greatest success, how those successes can be replicated, and how less-successful technologies and applications can be improved to deliver real economic, social, and political benefit.

There are two key dimensions to the program: creating a nurturing space for projects with a practical relevance, and creating a space for scholarship and learning. Faculty, staff, and students lead the research projects. Currently, the program is initiating in-house research on using basic mobile phones to monitor governments and combat corruption and an incubation space for technology-based activist projects from around the globe. A d.school course on Designing Liberation Technologies has led to the development of Stanford student-initiated projects, where students work closely with Kenyan nongovernmental organizations to design mobile phone applications for real-life issues such as finding clean water, safety, and health education. Partner organizations have adopted the projects, with some receiving seed money from collaborating Stanford schools and departments.

As a learning space, the program runs research seminars where leading scholars and practitioners of liberation technologies report on what they are learning and doing. These seminars result in reports, working papers, and academic publications that inform the program's community of affiliated scholars about the latest developments in the field. The program also hosts postdoctoral fellows, who enrich the program's research and design activities with their cutting-edge work. Each year, the program brings one fellow with a specialization in law or social science, and another specialized in computer science or some other area of engineering. The program supports undergraduate research and conferences, student-initiated courses, and small-scale student conferences exploring the use and development of liberation technology.

Libya

The history of Libya parallels that of other previously colonized nations. The country now suffers from economic, class, gender, religious, and ethnic inequalities. Libya gained independence from Italy in 1951, becoming the United Kingdom of Libya, a constitutional and hereditary monarchy. After the discovery of oil reserves and growing income from petroleum sales, Libya became a wealthy nation. However, discontent arose with the concentration of the country's wealth and power in the hands of a few.

In September 1969, a group of military officers led by Muammar Qadhafi launched the Libyan Revolution and deposed King Idris. The constitution was abolished and policies were outlined in the Green Book, a proposal of Qadhafi to improve and develop the country. Keeping Libya debt free, the government increased per-capita income and improved the ranking of the country in the

Human Development Index for Africa. However, beginning in the 1970s, most oil profits were spent on arms and supporting terrorist groups. Without any democratic elections, in 1977, Libya became the Great Socialist People's Libyan Arab Jamahiriya, and Qadhafi gained unlimited power. In 1986, there was a failed assassination attempt against Qadhafi, and shortly thereafter, Libya was sanctioned by the United Nations (UN).

The "Permanent Revolution" of Qadhafi has been characterized by its brutality and extravagance. The dictator prohibited private ownership and retail trade, banned the press, controlled the military, implemented Sharia (Islamic) law, and pursued dissidents. Libya's decades of international isolation left the country without political alliances or national organizations of any kind. Libyan society had been fractured, and was divided along kinship and regional lines. In his later years, Qadhafi changed from an anti-Western terrorist dictator to a something of a Western ally in the global war against terrorism and fundamentalist Islamism.

The Arab Spring

At the beginning of 2011, revolutions in several Arab countries were highlighted in the worldwide media. Social media played an important role in these political changes. The Arab Spring, as it became known, reached Tunisia, Egypt, Bahrain, Syria, Libya, Jordan, Morocco, Algeria, Yemen, Oman, and Djibouti. Social media applications such as Facebook, Twitter, YouTube, and Flickr were key to this revolution. These platforms were the epicenter of Arab regional social media innovation and helped build new communities. The terms *Twitter revolution* and *Facebook revolution* appeared in many newspaper headlines. However, demographic issues as well as social and political patterns among countries were diverse.

Comparisons of substantially different economies and cultures became habitual, although this led to fallacies. Activists used technology to share ideas and disseminate their messages. Nevertheless, the main issue is that these uses resonated in different ways in local contexts and in the global sphere. Therefore, were social media facilitators of the revolution? There is no consensus. Yet, it became clear that political developments in the Arab world demonstrated that youth were using

the Internet as a political platform and as a tool to mobilize people for change.

The use of platforms such as Facebook and Twitter highlighted the shift from social tools to political tools, not only in the Arab world, but also in the larger Arab diaspora. Through social media, diasporas have been instrumental to change. However, broadcast media have not been redundant in the revolutionary processes. The roles of the Al Jazeera and Al Arabiya television networks were also significant.

Because the Libyan regime was based in a society fractured into clan and regional networks, armed rebels ignited the protests first within the eastern provinces. The first manifestations in Libya began on February 15, 2011, and in the following days, more than a dozen protesters were killed in confrontations with pro-Qadhafi tribes and secret police. Protests of government intransigence and brutal repression of demonstrators grew into a revolt that rapidly spread through the eastern part of the country, which had traditionally been opposed to Qadhafi.

In April 2011, the *New York Times* reported that two sons of Qadhafi had attempted to articulate a transition to a constitutional democracy that would include their father stepping down. The transition was to have been conducted by one of Qadhafi's sons, Saif al-Islam Qadhafi. The rebels, however, rejected the proposal. The North Atlantic Treaty Organization (NATO) took command of military operations in Libya. The decision was unanimously made by member states of the organization after several days of tough negotiations on NATO's role and its ability to perform air strikes on ground targets.

Even with a defeat of pro-Qadhafi forces declared, and complete occupation of the territories, Saif al-Islam Qadhafi remained in hiding in the south of the country until his capture in November 2011. In addition, members of the former government escaped to Niger despite encountering violence when they were detected by troops from that country.

Role of Social Media

Although digital migration is still in its early years in Libya, the use of social media for external dissemination of protests revealed the tribal and regional cleavages in the country. In Libya,

Families belonging to the Libyan diaspora in Dublin, Ireland, protesting against the regime of Muammar Qadhafi on March 19, 2011. During the Libyan uprising, the diaspora became a source of information about what was happening inside the country for international audiences. Libyan youth in the diaspora also helped popularize the movement's now iconic Twitter hashtag of #feb17.

the Internet penetration rate was quite low: Only 5.4 percent of the population had access in June 2010; and in March 2011, only 1.1 percent had created accounts on Facebook. These numbers demonstrate that it is not possible to argue that social media was the main driver behind the uprising in Libya. From an internal perspective, the numbers demystify the idea of the Facebook or Twitter revolution.

Numerous Facebook pages and hundreds of thousands of tweets supported the protest. Moreover, mobile devices were used for both messaging and conveying information. On February 18, the regime disabled the Internet, hoping to smother the protests. Nevertheless, they increased, culminating in bloody clashes between rebels and those loyal to Qadhafi. As social media facilitated free expression, Qadhafi's regime replied with brutal repression and

arrests. Word spread through independent social media in the diaspora, resulting in an increase in citizen engagement. Social media became watchdogs of the official Libyan press and disseminated information to the Western world. Several Twitter campaigns were directed to public figures and against political actors in Libya. The Libyan government tried to respond, and became particularly active on Twitter. Saif al-Islam also tried to use social media to spread his message to the international community and express his determination to govern Libya and move the country toward democracy.

As the revolution had several social and political actors, it became clear that many had appropriated social media as methods of propaganda. The "YouTube war" exposed the uses of social media platforms for the purposes of political dissident and activist organizations. There were

many questions about the content published, and confirmation of information was increasingly difficult, with armed rebels on the ground hindering the work of media professionals. The propaganda war became evident in video content, fake pages created on Facebook, and false information disseminated on Twitter. The different streams in social media provoked many questions about what was actually happening in the country.

Journalists and bloggers faced serious repercussions for expressing independent opinions and publishing information. Several social media campaigns demanded rights for Internet users, journalists, citizen journalists, and bloggers. The Qadhafi regime severely repressed digital dissidents. The imprisonments were emblematic of control of digital space. Hence, the Libyan diaspora became an important source of information about what was happening inside the country for international audiences. In fact, the Libyan youth movement in the diaspora directly reported on Twitter and Facebook, and tagged their messages with the hashtag #feb17.

As Tripoli collapsed into a civil war, social media were used to empower the revolution as well as to place the messages into a transnational sphere. On Twitter, users from around the world began tagging tweets with #feb17 in an international demonstration of solidarity for the pro-democracy protests. Media professionals directly dialogued with users through these streams and relied on the techniques of semantic classification to remain at the forefront of publishing content and attracting audiences.

The new tools implemented different (simple and simultaneously complex) social objects that promoted new practices: to subscribe, like, retweet, Digg, or share. This means that users' online behavior could be studied as activities. Therefore, social practices could be identified as leading to social action and interaction. The role of hashtags in the Libyan revolution were relevant because they promoted adherence to social and political movements, ensured information streams, indexed messages to contents, and disseminated information by communication channels that promote collective action through social interactions.

The NATO intervention in Libya was also an issue that has been much discussed in social

networks, and led the rebels to impose severe punishments on critics. What seemed like a revolution for democracy began to raise questions in social networks and in the Libyan youth movement in the diaspora.

Conclusion

After five months of being blocked, by August 2011, the Internet was again available to the Libyan public. The capture of Qadhafi and his death at the hands of the rebels seemed to put an end to civil war in October 2011. Although Libya is currently undergoing political reconstruction, widespread corruption and scarcity of basic goods still occur. The main issue is state formation, not just democratization. The 6.4 million people in Libya are still living in fear of another war, and are still divided along provincial lines.

Social media is still used to expose what is happening in the country. As media professionals have begun to redirect attention to Syria, social platforms have become one of the only media to disseminate information on the real situation in Libya. Some youth from the diaspora have returned, and are playing an important role in confronting the disillusionment that followed the fall of Tripoli to the rebels.

The opposition members who took power after Qadhafi understood the role of social media. Attempts to limit Internet access were frustrated because users could get to Twitter via SMS and virtual private networks and proxy servers that allow secure remote access to external networks. Limiting communications with the outside world not only failed, but also highlighted the need for additional change.

Social media continued to play an important role at this stage. After the elections in July 2012, the new leaders of the country had difficulty imposing their authority over the rebel brigades who fought the Qadhafi regime in 2011. Some militias believed that their legitimacy was greater than that of elected officials. The population responded by organizing demonstrations, and managed to oust Islamist groups. Amnesty International reported that although most human rights violations had been committed by the forces of the deposed regime, supporters of the new regime had also been involved in torture and murder.

Facebook pages and Twitter continue to have a significant impact on the disclosure of information from the country, often surpassing media professionals and television networks. However, bloggers and citizen journalists continue to be harassed, and Internet access is still controlled by the authorities and militias, according to both Reporters Without Borders and Amnesty International.

The critical mass of Twitter, mostly Western, considers this kind of pressure on citizens unacceptable, and also condemned the way in which Qadhafi was executed. The trial of the son of the dictator and imprisonments and repression of digital dissidents are now the most discussed topics in social media concerned with the situation in Libya. The hashtag #feb17 continues to be used to index content on the Libyan revolution and its aftermath.

The use of social media cannot be interpreted as a direct cause of changes in Libya. Cyberspace was the link between different networks and established new public spheres for debate. Digital media has individualized, localized, and structured a collective consciousness. Within this emerging news ecosystem, political uses of social media were also exposed. Social media do not generate revolutions, but may facilitate them and aid political actors in transforming their public image. Nevertheless, social media can change the nature of news, just as Arab satellite channels helped to broadcast the revolution.

Lieberman, Joe

Joseph Isadore "Joe" Lieberman is a former four-term U.S. Senator from Connecticut, nationally well known for his roles in the 2000 and 2008 presidential campaigns. Lieberman, who spent most of his political career as a Democrat, earned the party's vice presidential nomination in 2000, becoming the first Jewish candidate on one of the major party's presidential tickets. A leader who often reached across the political aisle to find common ground, Lieberman became an independent in 2006, and further broke away from his party during the 2008 presidential campaign to become a chief surrogate for Republican candidate John McCain. Lieberman is also known for his sometimes controversial legislative agenda that included issues such as lesbian, gay, bisexual, and transgender (LGBT) rights, homeland security, and cybersecurity.

Born in Stamford, Connecticut, on February 24, 1942, Lieberman is twice married with three children, one stepchild, and 12 grandchildren. Lieberman married his first wife, Betty Haas, when he was a student at Yale Law School in 1965. After divorcing in 1981, Lieberman met his second wife, Hadassah Freilich Tucker, the child of Holocaust survivors who fled to the United States. Still married to Hadassah, the two describe themselves as "observant" Jews. Lieberman's faith brought him attention throughout his career, but especially when he was selected as Al Gore's running mate in the 2000 presidential election. Speculation over whether Lieberman's faith would pose a problem for the Gore campaign died down after the election, when Gore and Lieberman lost the electoral college, but received over half a million more votes than their Republican opponents George W. Bush and Dick Cheney.

Career

Before becoming the Democratic Party's vice presidential candidate, Lieberman served for 10 years in the Connecticut Senate, six years as the Connecticut attorney general, and 14 years in the U.S. Senate. Although he served those years in the Senate as a Democrat, Lieberman often could have been described as a political maverick at that point in his tenure. Lieberman often sided with mainstream Democrats, agreeing with their

Former Senator Joe Lieberman in conversation with General David H. Petraeus at the International Security Assistance Force Headquarters in Afghanistan. Senator Lieberman was taking part in a congressional delegation tour in November 2010, and was accompanied by several other senators, including John McCain, for whom he campaigned during the presidential election of 2008.

positions on issues like abortion, gun control, and the environment. Lieberman was a strong proponent of environmental legislation, helping negotiate the Clean Air Act Amendments of 1990, voting to ban drilling in the Arctic National Wildlife Refuge in Alaska, and authoring bills to combat climate change. However, Lieberman often sided with Republicans on foreign policy, and also angered many in his party by being the first prominent Democrat to publicly reprimand President Bill Clinton during the Monica Lewinsky scandal.

Lieberman's run for vice president coincided with his campaign for re-election to the Senate. Although Gore and Lieberman ultimately lost the presidential contest, Lieberman easily maintained his seat in the Senate, winning 64 percent of the vote over his Republican opponent. As a Senator, Lieberman soon became chair of the Homeland

Security and Governmental Affairs Committee, and was a leader in efforts to create the Department of Homeland Security. Lieberman supported the wars in Afghanistan and Iraq, and became a target of criticism from the left for his continued support of both military operations. In an interview with FOX News anchor Chris Wallace, Lieberman would later admit that he identified as a Democrat on the majority of domestic issues, but largely sided with Republicans on foreign policy.

Lieberman's support for the Iraq War, along with his other conservative positions on a variety of issues, did him no favors when he sought the Democratic nomination as a candidate in the 2004 presidential election. Lieberman's former running mate Al Gore snubbed Lieberman with his endorsement of Howard Dean in December 2003. Lieberman withdrew from the race on

February 3, 2004, after failing to win a single primary or caucus. Ultimately, Lieberman found himself on the losing end behind six other candidates, including Reverend Al Sharpton, retired General Wesley Clark, Ohio Representative Dennis Kucinich, former Vermont Governor Howard Dean, North Carolina Senator John Edwards, and the eventual nominee Massachusetts Senator John Kerry.

As fewer and fewer prominent Democrats supported the Iraq War, Lieberman again found himself out of favor with many in his party as he campaigned for re-election to the Senate in the 2006 Democratic primary. While Lieberman received the support of some Democrats in his primary battle, he went on to lose the party's nomination to antiwar candidate Ned Lamont. After losing the primary, Lieberman ran as an independent candidate on the newly formed Connecticut for Lieberman Party's ticket. Running against Lamont and Republican Alan Schlesinger, Lieberman became a divisive figure to his Democratic colleagues in the Senate. Most, including notable names like Democratic Minority Leader Harry Reid and New York Senator Hillary Clinton, expressed their support for Lamont; only five Democratic senators endorsed Lieberman. Meanwhile, Republicans largely expressed their support for Lieberman over their candidate. Lieberman racked up notable endorsements from Republicans like former House Speaker Newt Gingrich, former New York Mayor Rudy Giuliani, and Maine Senator Susan Collins. Lieberman eventually won the race and returned to the Senate to caucus with the Democrats, giving the party a 51–49 seat majority.

Citizens for McCain

Although he continued to caucus with the Democrats, Lieberman endorsed Republican Arizona Senator John McCain for president on December 17, 2007, when the Democratic field of candidates still included eventual nominee Barack Obama, as well as Hillary Clinton, John Edwards, Dennis Kucinich, Delaware Senator Joe Biden, New Mexico Governor Bill Richardson, former Alaska Senator Mike Gravel, and fellow Connecticut Senator Chris Dodd. Citing his support for McCain's foreign policy positions, Lieberman became one of the candidate's most visible

supporters on the campaign trail. In June 2008, Lieberman launched Citizens for McCain in an effort to attract moderates and disaffected Democrats to the candidate's side. The effort primarily targeted former Clinton supporters who may have been reluctant to support Obama. In September 2008, Lieberman assumed a key speaking role at the Republican National Convention, where he argued that McCain's experience (and Obama's lack thereof) made the Republican ticket better qualified to serve the nation.

Lieberman's close relationship with McCain kept the media speculating over possible cabinet appointments for the Connecticut senator in a McCain White House. Many believed that McCain wanted to select Lieberman as his vice presidential running mate, but others thought that selection would anger the more conservative wings of the Republican base. When McCain announced Alaska Governor Sarah Palin as his choice for vice presidential nominee, the media began to speculate more about Lieberman serving in other positions, like secretary of state.

Instead of assuming a high-level cabinet position, Lieberman saw McCain lose the election in a landslide defeat, and then faced an angry Democratic Senate majority that threatened to take away his chair on the Committee on Homeland Security and Governmental Affairs. Although Senate Minority Leader Mitch McConnell approached Lieberman about caucusing with the Republicans, Lieberman decided to stay with the Senate Democrats after Obama convinced Senate Majority Leader Harry Reid to let Lieberman keep his chair. Lieberman was instead stripped of his membership for the Environmental and Public Works Committee as punishment for supporting McCain during the election.

Health Care

Since the 2008 campaign, Lieberman has continued to be an independent voice in the Senate. During debates on health care legislation, Lieberman came out against any plan that included a public option, and threatened to join Republicans in a filibuster if any such plan should come to the floor. Lieberman opposed plans including government-run insurance programs because of the burden he claimed it would put on taxpayers and the national debt.

Lieberman was one of the most vocal critics of the public option, and helped force Democrats into pulling the feature from their legislation. With that disagreement out of the way, in December 2009, Lieberman sided with the Democrats and was one of 60 senators who voted for the Patient Protection and Affordable Care Act, commonly known as Obamacare.

LGBT Rights

Lieberman regained some favor with Democrats as an out-front spokesperson for the repeal of “Don’t Ask, Don’t Tell.” Lieberman had supported the initial passage of the policy prohibiting gay, lesbian, and bisexual troops from openly serving in the military; however, he believed the policy was outdated and discriminatory by 2010, and pledged to work toward its repeal.

Along with Susan Collins, Lieberman introduced a bill repealing the policy, which passed the House of Representatives in a vote of 250–175, and the Senate in a vote of 65–31. Before the Senate vote, Lieberman gave the final argument for the legislation’s passage, while his friend and colleague John McCain argued against repeal. President Obama signed the bill into law on December 22, 2010.

National Security

While Lieberman opposed McCain and many conservatives on the issue of gays openly serving in the military, he remained hawkish on other issues of national security. In January 2012, Lieberman cosponsored the Enemy Expatriation Act with Senator Scott Brown and Representatives Charlie Dent and Jason Altmire. This controversial bill was designed to allow the federal government to strip U.S. citizens of their citizenship if they participated in certain terrorist activities.

Internet Freedom and Cybersecurity

In recent years, Lieberman has taken on the controversial issues of Internet freedom and cybersecurity. In 2008, Lieberman’s Senate Committee, viewing the Internet as a potential vehicle for terrorist threats, issued a report titled “Violent Islamist Extremism, the Internet, and the Homegrown Terrorist Threat.” Lieberman also called on YouTube to take down hundreds of videos produced by Islamic terrorist supporters. Lieberman

was criticized on freedom-of-speech grounds, but remained persistent with his call for censorship, and in June 2010, he introduced the Protecting Cyberspace as a National Asset Act of 2010, a bill he coauthored with Susan Collins and Democrat Thomas Carper of Delaware. Lieberman claimed that the bill would give the president authority to respond to cyberterrorist attacks on government infrastructure. Vocal opponents labeled the legislation the “Kill Switch Bill” and alleged that it would give the president unprecedented authority to take over or shut down the Internet.

Lieberman also came under fire for actions related to WikiLeaks, an organization that publishes secret and classified information from anonymous sources. Lieberman directed his staff to make inquiries into Internet companies like Amazon.com, which provided service to the controversial WikiLeaks. With Senators John Ensign and Scott Brown, Lieberman then introduced legislation to amend the Espionage Act in order to affect WikiLeaks and similar Internet sources that leaked classified information. Again, Lieberman’s call for censorship drew criticism from those insisting that such legislation hinders the free speech rights of both new and traditional media sources.

Cybersecurity legislation has continually proved controversial, and has failed to receive the 60 votes needed for the Senate to take up the issue. In December 2012, Lieberman lamented that “cybersecurity is a goner and I’m really disappointed about it.” Lieberman continues to believe that the nation is unprepared for a cyberterrorist attack that he claims could be more devastating than the 9/11 terrorist attacks. While Lieberman campaigned against Internet security threats, he also recognized the communicative advantages provided by social media, and maintained an active presence on sites including Facebook, Twitter, and YouTube. Lieberman often posted pictures and videos, as well as links to articles about himself and the issues he championed.

Retirement

In January 2011, Lieberman announced that he would retire from the Senate at the expiration of his fourth term. With credible opponents on both sides of the aisle, like Republican Linda McMahon and his eventual successor Democrat

Chris Murphy, some pundits questioned whether Lieberman had a realistic pathway to re-election if he had chosen to run again. Lieberman discounted such criticism, and served the remainder of his term relatively quietly. Lieberman refrained from endorsing a candidate in the 2012 presidential contest, and presented himself as a voice of reason on the “fiscal cliff,” encouraging compromise between Democrats and Republicans on the issues of taxes and the national debt. Lieberman also spent his final days in the Senate, campaigning for an end to the filibuster, a tool he had both utilized and criticized in the past.

Since retiring, Lieberman has somewhat withdrawn from public view, not updating his Facebook or Twitter accounts since December 2012. However, he remains a steadfast advocate for many positions, and recently joined the American Enterprise Institute, a conservative think tank aiming to build consensus around various foreign policy issues. Lieberman may be remembered negatively by some as a controversial figure, and by others positively as the rare independent in Washington, unafraid to compromise across party lines. As the first Jew on a major presidential ticket and a central surrogate and supporter of John McCain’s 2008 White House bid, Lieberman has also secured himself a place in national political memory.

LinkedIn

LinkedIn is a publicly held social-networking Internet company tailored toward professionals across all industries. Founders Reid Hoffman, Allen Blue, Konstantin Guericke, Eric Ly, and Jean-Luc Vaillant established LinkedIn in December 2002, and launched the site on May 5, 2003. The CEO of LinkedIn is Jeff Weiner. Headquarters are located in Mountain View, California, with offices throughout the United States, including Chicago, Los Angeles, New York, Omaha, and San Francisco, and 20 international offices spanning the globe. In 2010, LinkedIn opened a European headquarters in Dublin, Ireland.

Hoffman argues that many people are not equipped with the skills to effectively remain mobile so that they can grow professionally, and he believes that it is LinkedIn’s job to assist professionals in making connections. The intention of LinkedIn, according to Hoffman, is to assist members to create, manage, and share their professional identities online while strengthening their professional connections through social networking.

LinkedIn has a diversified business model. Revenue is generated from hiring, marketing, advertising products, and premium subscriptions. The company receives most of its revenue, about 42 percent, from LinkedInJobs, which generates more than \$102 million a year. LinkedIn Corporate Solutions are tools that aid businesses in locating qualified candidates for positions, whereas LinkedInJobs allows businesses to advertise open positions on the site. Premium subscriptions only account for 25 percent of annual revenue for the company.

The remaining annual revenue, approximately \$79 million, is generated from advertising. LinkedIn Ads is a self-service option that allows advertisers to build and target their advertisements to LinkedIn members. LinkedIn offers additional services for businesses through LinkedIn Ads for Enterprise, which handles large-scale marketing and advertising accounts. LinkedIn’s business model has it collecting money directly from individuals and businesses. The company has its feet firmly planted in the service industry and the technology field. LinkedIn has more than 2,860 employees globally.

Much has changed since the day LinkedIn was started in Hoffman's living room in 2002; namely, growth. By the end of the first month, LinkedIn had 4,500 members; in June 2013, there were more than 225 million members globally, with more than 60 percent living outside the United States. The top five countries with the most LinkedIn small business membership accounts include the United States, the United Kingdom, India, the Netherlands, and Canada. LinkedIn is available in 19 languages. LinkedIn reports that the rate of membership growth is estimated at two members per second. The fastest-growing membership group is college students and recent college graduates. LinkedIn is considered the world's largest business social networking site. Members range from college students to top business executives. Executives from every Fortune 500 company have a LinkedIn account, making this network as deep as it is broad.

Site Features

To assist professionals to effectively create, build, and maintain business networks, LinkedIn uses a registered membership model, where every user must create an account and register with LinkedIn. Accounts exist on a continuum, ranging from free to premium. Users create their accounts by adding professional histories and information, including résumés. It is against LinkedIn policies to create a solely personal profile page; that is, all individual pages must be career-life focused. Professional networks are built by adding connections with fellow LinkedIn users. Accounts can be personalized as users post photos and showcase their work and community service activities.

Networks are established by inviting people into one's network. Connections can be first degree, where the person has a direct professional association with the person, such as being current or past colleagues at a company. A second-degree connection is a relationship by means of a mutual association, such as a former colleague of a current coworker. Connecting via a second-degree connection is called a third-degree connection. Third-degree connections can be beneficial in helping to establish a connection with someone to whom you may wish to be introduced. In addition to individual membership accounts, LinkedIn offers groups for special interests. There are well

over 1.2 million LinkedIn Groups, with the largest category being professional and career issues. Academic and corporate alumni groups account for more than 120,000 of the LinkedIn Groups. The openness of groups can vary from private to open to all Internet users.

LinkedIn offered some new features in 2011, many intended for companies or enterprises. Companies can create free banner advertisements linking back to content. Companies benefit from this added tool because it allows them to bridge LinkedIn with other social media. LinkedIn supports video content on pages, allowing companies to add videos about products or services. Recommendations are all offered by LinkedIn, where recommendations are shown based on connections in a network. Much like Facebook, LinkedIn has a "follow us" button that can be added to a Web site, blog, or other social media platform. By means of HTML code, LinkedIn can connect a company's Web site with its LinkedIn page; visitors to a company's Web site can click a "recommend" button that connects to the company's LinkedIn page. LinkedIn, similar to Facebook, has a "share" button.

LinkedIn is a social networking site that focuses on the business side of effectively building professional connections. The goal of LinkedIn is to aid individuals, companies, and groups in accessing shared knowledge and insights and locating advantageous business opportunities.

Lobbyists

By definition, lobbyists can be described as a group of persons engaged in conducting activities aimed at influencing public officials and the activities of governmental agencies. The term is widened with the inclusion of anyone who tries to impact governmental activities, including the legislative process. In this context, one can argue that lobbyists target to impact policymaking, decision-making, or decision-taking processes of states and organizations other than states. Therefore, lobbyists are perceived as the person who can impact the cited processes that are concerned with their purposes and interests.

Lobbies are becoming increasingly significant in the 21st century. There are a number of factors that have contributed to the rise of lobbies. They may include the media, advances in new technologies, globalization, democratization, human rights, and the rule of law. In this sense, cited factors have facilitated collective action, mass participation, involvement of third parties, mobilizing resources or structures, and increasing political opportunities, which contribute to political change and strategic outcomes.

Civil Society and Lobbyism

The concept of civil society has existed for centuries. Its meaning has varied across time, place, theoretical perspective, and political persuasion. The term *civil* signifies a measure of good faith and respect for law. As an ancient term, *societas civilis* refers to the rule of law and active participation of citizens in public life. Liberal theorists explain civil society as groups of citizens who emerge and associate spontaneously and freely. As an outcome of liberal assumptions, relations among private individuals, groups, and societies that can produce important consequences for the course of events have also supplemented international relations among governments. In broadly accepted terminology, the concept of civil society

can be defined as "an intermediate sphere of voluntary association and activity standing between the individual and the state."

The number of civil society organizations (CSOs) has grown exponentially, and they have expanded their scope, from aiming at specific targets like slavery or prisoners of conscience, to fundamental matters of global governance. Such an increase suggests that lobbyists will play a crucial role in the political arena, where the modern state system faces severe challenges.

There are several factors playing a role in encouraging the growth of lobbyists since the 1970s: the result of globalization and the emergence of interdependency issues around the globe, United Nations (UN) sponsored global conferences, advances in communication and information technologies, the end of the Cold War, and the spread of democracy. Pluralist thought also argues that openness of the political system leads to the creation of an environment for other stakeholders. For example, there are a number of actors other than governments and citizens such as social networks, advocacy groups, and lobbyists, who have shared interests and seek to influence policymaking processes within governmental agencies.

Lobbyists have transcended national and regional borders with the processes of globalization, and have become a part of the global system. Today's lobbyists cannot only be considered as a simple social polity crossing national borders, but also as important social actors within structural forms ranging from organized nongovernmental organizations (NGOs) for public benefit and associations for member benefits, to faith-based organizations, Internet-based pressure groups, and antiwar or antiglobalization protestors. Social associations, NGOs, citizen movements, student bodies, environmental groups, feminist networks, human rights advocacy chains, epistemic communities, and so forth, are principal members of global civil society that can act and perform lobby activities around the world. To give an example, Greenpeace, Doctors Without Borders, Initiatives of Change, and International Campaign to Ban Landmines are considered well-known lobbyists.

Originally, lobbying activities were targeting legislative and decision-making processes within states. As time passed, lobbying has included

intergovernmental phenomena such as lobbying legislative processes in the European Union and the UN. Thus, lobbyists have played a crucial role in all forms of agenda setting, including at the national and supranational level. Therefore, one can claim that the context of lobbying activities has shifted into a global sphere with the involvement of social media, as compared to the old sense of lobbyism used to refer to national drives and conventional tactics.

To make an overall definition, lobbyists can be viewed as the field of action and thought occupied by individual and collective citizen initiatives, of a voluntary nonprofit character, both within and among states. However, the term *lobbyists* has undergone dramatic transformations. The old sense of the word encompassed the wining-and-dining era when lobbyists were financing cocktail parties and social activities and benefiting from organizing pressure on elected or governmental officials over specific social, economic, and political issues. In contrast, lobbying in the contemporary era requires new strategies, information-based initiatives, and social media coverage, thereby changing the conventional definition of lobbyists. Additionally, the emergence of diverse social media tools has profoundly accelerated the rise of lobbyists.

One question behind these definitions is how a lobbyist can accomplish desired ends. Utilities or services designed for realizing the purposes and interests of lobbyists are primarily concentrating on information and persuasion. Information and persuasion can be considered valuable assets that a lobbyist can benefit from while influencing decision-making or policymaking processes. Therefore, with the help of these tactics and strategies, lobbyists can generate a power that can ensure the achievement of individual purposes and interests regarding the decision-making and decision-taking processes. Lobbyists, therefore, can be acknowledged as key actors in the democratic system; they perform a vital function in raising awareness about important issues.

Transnational Lobbying Activities

As one of the policy responses to contemporary globalization, transformism sees lobbyists as a source of fundamental social change. Thus, the lobbyists of worldwide peasant activists,

indigenous people, women, and working classes have all sought social changes as a result of their transformist views. In this sense, lobbyism can be defined as a sustained campaign of claim making, using repeated performances that advertise claims based on organizations, networks, traditions, and solidarities that can sustain these activities.

Scholar Mary Kaldor classifies activities of lobbyists as “old” and “new.” Old lobby activities tend to be labor movements, national movements, self-determination movements, or anticolonial movements. Contemporary lobby activities, however, retain global features such as international human rights activists, global environmental groups, or groups defending women’s rights. Flows of information have facilitated the emergence of transnational advocacy networks and transnational lobby activities. As communication technologies have become decentralized, cheaper, and more accessible, the ability of states to control communications has diminished.

The boom in information and communication technologies has formed the infrastructure of globalization in finance, capital mobility and export-oriented business activity, transnational communication, migration, and travel, as well as civil society interactions. There has been an unprecedented compression of time and space, as individuals, groups, and governments increasingly integrate political, economic, and social processes across national boundaries. Transnational movements of lobbyists, moreover, have displaced domestic contention; they will deactivate the boundaries between states and activate new boundaries that can lead to the formation of lobbyists.

Social Media Coverage

Lobby activities within states and regions have reached a broader sphere of influence. The description of certain lobbies as “transnational” has been increasingly common. The primary goal of these lobbies is to create, strengthen, implement, and monitor international norms. States or political systems violating these rights have been countered by lobbyists in the international arena. Such lobbyists have been so powerful that they have generated significant changes in political systems. The “color revolutions” of former Soviet republics in eastern Europe and Central Asia,

which took place in past decades, are the most significant indicators of the power of global civil society and transnational lobby activities.

In this era, social and political problems in a certain society do not stay within the borders of that individual state, but can attract global awareness through transnational networks of lobbyists. For example, the Danish cartoon crisis in 2005 represents the impact of lobbyists on the behavior of political actors. Several strategies and tactics, including media coverage, transnational visits and trips of interfaith communities to the other countries, peaceful demonstrations, and boycotts led to both the Danish prime minister and editor-in-chief of the newspaper that published the cartoons expressing their regrets about offending Muslims.

Consequently, the examples of color revolutions and the case of the Danish cartoon crisis demonstrate that social and political problems are no longer national or regional. There is a noticeably rapid flow of information among the members of global civil society and lobbyists. Thanks to the rapid flow of information, lobbyists are now able to simultaneously react. By the increase of nationally defined close-minded interests, they have contributed to the creation of long-term social ties. Building connections and improving joint solutions, activists have been exposed to a diverse coalition of viewpoints and concerns, thereby contributing to the engendering of mutual understanding and trust as a basis for future cooperation. For instance, a group of 1,500 citizen organizations from 89 different countries have called on governments to adopt a suspension on any new issues that expand the scope and power of the World Trade Organization, in the so-called Battle in Seattle.

Social media coverage now plays a crucial role in the activities of lobbyists. There has been a dramatic increase in the amount of social media tools, digital media technologies, and social platforms, including Twitter, Facebook, and blogs, which are strategically employed by lobbyists in order to affect policymaking mechanisms. This does not mean that conventional strategies and tactics have been eroded and social media tools are the only means that lobbyists would resort to. However, diverse social media tools have contributed to the enrichment of lobbying activities,

thereby ensuring new strategies and tactics for lobbyists.

Conclusion

The impact of lobbyists and civil society in this century has been more salient than before. The globalization process, advances in new technologies, the development of international values and norms, as well as calls for human rights are the paramount factors that promote lobbying activities and initiatives of global civil society, which in turn lead to the creation of political changes and strategic outcomes.

One of the challenges of the globalization process for the future is considered to be the legitimacy of the system. The participation of civil society in world politics and providing NGOs and lobbyists access to global governance activities will contribute to overcome the challenges that global governance has been facing. Additionally, a larger and higher quality of lobbyists' involvement in worldwide issues could significantly improve public education, public debate, public accountability, and public participation in the issues of international affairs. It is apparent from the developments over the past few decades that the rising importance of lobbyists continues not only within states, but also at the international level.

However, lobbying activities have shifted over the course of the time. Initially, they were concerned with policy- and decision-making processes within states. Now, they have begun to impact policymaking processes of intergovernmental organizations, such as the European Union and the UN. Furthermore, in the old sense of the word, lobbyists used to host cocktail parties and finance social activities in order to gain influence. By contrast, the approach that lobbyists implement today is more related to employing social media tools, thus aiming to influence decision-making mechanisms both in states and at the international level.

Irrespective of shifting strategies over time, the main goal of lobbyists, which has not changed, continues to be influencing government activities through information and persuasion. The emergence of a global civil society and lobbyists has been crucial now that technological and political changes have produced notable impacts around

the world. Furthermore, these changes will continue as globalization proceeds and social media tools further spread. Therefore, the importance of global civil society and lobbyists will also likely increase in the future.

London School of Economics Public Policy Group

The London School of Economics Public Policy Group (LSEPPG) is a university think tank that supplies consultation and recommendations for a variety of clients in the public sphere and private sector. The group conducts empirical research in the social sciences, provides detailed analysis of policymaking, and serves as an interface between academia, the private, public, and "third" sector. It operates four blogs on politics, policy, and the social sciences. In its role as a university think tank, the LSEPPG conducts pure and applied research and offers policy intervention and consultation to a diverse group of governmental entities, international organizations, and major corporations active in the fields of public sector innovation and productivity, citizen redress, policy evaluation, public engagement, building and audit, and e-government, survey and focus group research, public opinion, and the design of election systems.

The group is housed at the LSE Department of Government, where it is one of the research units in the department. The group was honored with an award by the United Kingdom's (UK's) *Times Higher Education* for best knowledge exchange initiative in higher education during 2011. The LSEPPG is ranked among the world's most influential think tanks. The group was jointly named the world's fourth-best university think tank in a

global survey. The PPG podcasts its public events and makes them available on its blogs. Some of the group's conference topics engage online media and present it in the context of policy issues, such as whether social security should be moved online. The PPG uses Twitter hashtags to promote its events held at LSE, and encourages participants to tweet using the hashtags while at event proceedings and conferences.

Blogs

The group's dynamic string of academic blogs has found new ways of stimulating interest in the social sciences and politics in the UK and beyond. The four blogs that the PPG runs are British Politics and Policy (BPP) at LSE, European Politics and Policy (EUROPP), LSE Review of Books, and The Impact of the Social Sciences. All four blogs bring together expertise from academics, policymakers, and analysts in order to promote social science debate, expressed through the writing and editing of research scholars at LSE. Social media that the LSEPPG incorporates on its academic blogs include Twitter, Facebook, RSS Feeds, and Pinterest. The blogs employ Google Analytics that track the number of unique visitors and are licensed under Creative Commons. They feature links to related LSE Podcasts of PPG events.

The BPP at LSE is the top-ranked university blog in the UK, according to *Times Higher Education*, and is the second most read economics blog there. The aims of BPP at LSE are to increase public understanding of the social sciences in the context of UK government, facilitate the sharing and exchange of knowledge between experts within and outside universities, and open up academic research to increase its impact. BPP draws primarily on the community and researchers at LSE, but the blog welcomes contributors from UK and overseas universities and other research organizations. It encourages submission of material that focuses on substantive insights or research as it pertains to any aspect of British politics and policy.

The primary goal of EUROPP is to maximize public understanding of social science in the contexts of European governance and policymaking, both at the level of the European Union, the countries across Europe, and within its neighborhood. The blog focuses on multidisciplinary themes

reaching from topics in European governance, economics, and politics to cultural and social issues, both at the EU and nation-state levels. It posts two articles each day of the week, a Brussels blog roundup, and weekly academic book reviews. A primary and strategic function of EUROPP within PPG as an entity is to commence a knowledge exchange. The blog aims to convey insights from academia to policymakers and citizens. Another of its goals is to bring to academic and wider attention the research and evidence generated by non-governmental organization, pressure groups, and a wider range of organizations researching on European politics and policy themes. EUROPP encourages the submission of material that can improve the evidence base for public debate on any aspect of European politics and policy.

The Impact of Social Sciences blog, run by the LSEPPG, is part of a larger research initiative, the Impact of Social Sciences research project. A joint project between LSE, Imperial College London, and the University of Leeds, the Impact of Social Sciences research initiative aims to investigate the impact of academic work in the social sciences on government and policymaking, business, and civil society. Another aim of the project is to demonstrate how academic research in the social sciences achieves public policy impacts, contributes to economic prosperity, and informs public understanding of policy issues and economic and social change. The project has made publications available to download on its blog. The blog functions as the main site for disseminating the research findings from any of the partners working on the project, as well as its publications, such as handbooks. It is updated daily with news articles and comment pieces on impact in the UK and abroad.

The LSE Impact blog has its own twitter handle, and its Tweets are also embedded in its blog page. Impact of Social Science and the LSEPPG-produced guides are available as downloadable and printable computer files and focus on social media topics such as how to use Twitter in university research, teaching, and impact activities. The Twitter guide was designed for use by academics and researchers, authored by LSE faculty, and made available in the public domain with Creative Commons licensing. The PPG and Impact also published a handbook that instructed academics

on how to set up a single or multiauthor blog. LSE's Impact blog curates a public list on Twitter of social science tweeters.

On the LSE Review of Books blog, additional social media embraced includes Soundcloud and Storify, and each blog post features a link to a reviewed book's page on Amazon's UK Web site, including to its Kindle edition. It won the European Podcast award, finishing first for 2012 UK Academic Podcast, and fifth in the UK Non-Profit category that year. The LSE Review of Books has a Twitter handle, and its tweets are embedded in the blog page. The blog's posts are Google+ sharable. The review has a Facebook page that is available to "like" on the blog's main page. Selections of book reviewers' tweets are shared on the blog.

responsive niche of voters. It is part of a procession of techniques adapted from the commercial marketing industry that have contributed in the last 40 years to the marketization of political and advocacy campaigning. Utilizing knowledge of audience attributes and characteristics such as race, religion, income, voting history, credit card purchases, lifestyles, spending habits, group memberships, ethnicity, class, and cultural groups, the concept of long-tail nano-targeting, like most targeting, rests upon the idea that audiences can be separated into small online niches of voters, and that messages can be tailored to those voters' particular interests. These voting blocs are targeted online and in a much more finely tuned manner than with traditional targeting or micro-targeting (both of which include other media such as radio, television, mail, and door-to-door canvassing).

There are various forms of targeting as it relates to political and advocacy campaigning: micro-targeting, hyper-targeting, and nano-targeting. In long-tail nano-targeting, "long-tail" refers to the way that niche marketing strategies are formulated on the Internet. In marketing, it enables retailers to inexpensively locate and market specialized or obscure products to individuals, regardless of geographical locale, who have an interest in purchasing those products. Correspondingly, the concept of nano-targeting has emerged from a long procession of marketing techniques that have been applied to voter targeting in political and advocacy campaigning.

Voter targeting spans back to the 1970s and 1980s during the campaigns of Presidents Carter and Reagan. Utilizing consumer databases to generate suitable mailing lists, campaign operatives sent tailored appeals to narrow, tightly selected members of the electorate on a wide-scale basis. The availability of more comprehensive and accurate voter databases has been key to the success of voter targeting in general. In the United States, both Republican and Democratic parties have amassed databases with information on practically every voter in the country. These databases integrate information culled from various public and private sources (e.g., telephone numbers, age, marital status, voting history, race, religious denomination, income, and other demographic information culled from survey data, direct marketing companies, credit reporting agencies,

Long-Tail Nano-Targeting

First used by Jeff Koster to describe targeting strategies used during Democratic Senator Al Franken's campaign for Minnesota senator in 2008, long-tail nano-targeting is a type of online political marketing that targets persuasive messages to the most

group membership rosters, consumer databases, and social media sites) to create a highly detailed picture of each voter.

These databases, along with the development of sophisticated technological tools and processes and widespread public accommodation of Web technologies, transformed the simple voter targeting of the 1970s, 1980s, and 1990s into the 21st century. Republican Mitt Romney's use of micro- and nano-targeting not only helped him prevail in his 2002 bid for Massachusetts governor, but also set the stage for adaptation of these techniques in major political campaigns like George W. Bush's 2004 re-election campaign, where the first extensive use of micro-targeting as a voter identification tool occurred.

Long-tail nano-targeting is not unique to any particular political party, organization, or group.

A Barack Obama supporter reading the program at a campaign fundraising event specifically for potential lesbian, gay, bisexual, and transgender donors in New York City in June 2011.

It has been extensively used by both Democratic and Republican candidates and a host of advocacy groups. However, the campaign of Barack Obama set the standard for the use of long-tail nano-targeting in a political campaign. During the course of his 2008 and 2012 campaigns, Obama's team collected millions of pieces of data that it fed into Democratic voter databases. This information, culled from disparate sources, but especially from online activities, concerned voter preferences about location and online activities. Later, using data mining, an applied statistical technique that is used to extract meaningful intelligence or knowledge from the patterns that emerge within a database, voter information was sorted, analyzed, processed, and subjected to predictive analytic techniques. A voter model or profile was then created for the purposes of categorizing voters, based upon particular attributes and interests. In this way, specific messages could be targeted to small groups of voters with the reasonable certainty that the message would be relevant to that group of voters. Because it is Web-based, long-tail nano-targeting allows for ever-smaller groups of voters to be segmented, based upon their prior online actions (down to the individual level).

Summarily, the core idea of long-tail nano-targeting is that the nature of the Internet allows individuals to be transient, never residing in one place for very long. Long-tail nano-targeting enables political campaigns and advocacy groups to place persuasive and tightly targeted messages (to the most responsive individuals) everywhere that the specified individual travels on the Internet. Highly relevant messages tailored to the voters' whims, preferences, and indulgences, are placed on Web sites that they visit, which when clicked on, direct those voters to the relevant portion of a candidate or organization's Web site.

As with any tool, long-tail nano-targeting can also be used as a tool of marginalization, discrimination, or privacy invasion. There are serious privacy and surveillance issues that have arisen. The purchases one makes, the Web sites on which one comments, and the videos one watches all can be, unbeknownst to the voter, harvested, analyzed, and sold to anyone with enough money. The personal information of millions of individuals is compiled, analyzed, and disseminated, often

without their knowledge or consent. Voters are compiled into clusters or segments based upon sometimes dubious or incorrect data in order to paint a picture of what is believed to be their preferences. There is no need for direct contact with the voter.

Critics of the excessive use of nano-targeting in political campaigns have argued that, by its very nature, the process is exclusionary and contributes to not only unjustifiable segmentation and polarization of the electorate, but also self-segmentation. In such an environment, voters have every incentive to only seek content that is congruent with their political preferences. In this way, the opportunity for voters to encounter and engage issues that are unplanned and unanticipated—which is central to the notion of healthy democratic engagement (especially regarding points of view that voters find incongruent with their own)—is greatly diminished. Excessive application of technologies like long-tail nano-targeting may limit voters' exposure to the randomness that builds understanding and empathy for different worldviews. The result may be that voters may become more entrenched than ever in their positioning and loyalty to particular policies, ideologies, candidates, and worldviews.

Luddite

A Luddite was a member of one of several groups of 19th-century English craftspeople known for

sabotaging industrial machinery that threatened their jobs. Although not themselves technophobic, the term *Luddite* has since been appropriated as a pejorative to dismiss the objections of someone who does not like, has difficulty using, or is otherwise hostile toward technology or its proponents. It can also refer to skeptics or cynics of new technology generally, an increasingly sympathetic position amid rapid development of technologies like the Internet, genetic engineering, mobile phones, and surveillance cameras. Most of these contemporary actors practice nonviolent, theoretical forms of resistance rooted in objections to narratives that link technological innovation to notions of "progress."

History

By the time the Luddites cohered in 1811, the English Industrial Revolution was well underway. In the preceding decades, the government had reoriented its laws and economic priorities in support of for-profit enterprise, regardless of the toll on individual workers. Technological unemployment and the replacement of artisans with unskilled labor became increasingly common occurrences. After the Combination Act banned trade unions in 1799, employees were left with little recourse.

In the burgeoning textiles industry, machine breaking emerged as a strategy to substitute for collective bargaining, somewhat successfully and simultaneously causing losses of capital for employers and ensuring their own necessity. Though scattered, the Luddites held a unified identity by writing letters to their employers and signing the name Ned Ludd, a folkloric figure who was said to have broken his father's knitting machine in a fit of rebellious rage.

Noting the movement's frequency and spread, and the public sympathy it enjoyed, the proindustry English government quickly passed a law in 1812 making machine breaking a capital offense, leading to a series of trials and hangings in the years that followed. Although the Luddites did not halt the implementation of labor-saving machinery, they did delay its introduction in certain areas, and although their motivations were entirely practical, their actions demanded consideration of the negative aspects of technological adoption.

Neo-Luddites

Luddites of the 21st century, sometimes called neo-Luddites, hold concerns that span industrialization, computerization, automation, cloning, privacy, deskilling, environmental impact, separation from nature, artificial intelligence, loss of humanity, loss of community, loss of individualization, and effects of new technologies generally. Sabotage remains a viable strategy for some activist groups like the Earth Liberation Front, People for the Ethical Treatment of Animals, and Earth First!, but the destructive acts have been given new labels like ecoterrorism or monkey wrenching.

Contemporary Luddites are defined less by breaking machines than by some form of opposition to “technological progress” as linear, inevitable, objective, desirable, or otherwise independent of the society from which it emerges. For them, every technological object has its own scrutable, ideological imprint and prescriptions for its use, which result from being created by people with particular values in a particular cultural context.

Few have ever self-identified as Luddites or neo-Luddites. After the machine breakers were banished, hanged, or otherwise deterred by the harsh new laws, their true motivations were swallowed up and obscured by the grand mythology of the Industrial Revolution. To be a Luddite was to be stubbornly old fashioned or to fight a hopeless battle against powerful forces of change. In economics, the Luddite fallacy attributes to them the argument that technological advancement does not adequately make up for the jobs it eliminates. In politics, pundits have accused Green Party members of being Luddites for their objections to technology that might pose threats to the environment, animal rights, or human rights. An article in a 2000 issue of the *National Review* even wielded the term to attack Al Gore when he challenged drug companies’ pricing policies. The former vice president’s position had little to do

with technology, but the article was able to capitalize on the connotations of Luddism by pointing to the effects that price regulation could have on biotechnology companies.

The relationships between jobs, economics, and technology remain complicated and controversial, but the immediately practical *raison d’être* of 19th-century workers has been displaced by two opposing senses of the name. Luddism serves simultaneously as a rhetorical device to call a particular position “anti-progress,” and an ideological orientation that challenges the very association between quality of life and technological complexity. Authors like Nicholas Carr and Sherry Turkle, for example, attract controversy and derogatory accusations of Luddism when they criticize the extent to which people use services like Google and Facebook. That neither advocates destroying or even abstaining from using computers illustrates the way deceptively moderate calls for caution or temperance somehow appear radical within the binary context of being for or against “progress.”

M

Mamfakinch

Mamfakinch (Moroccan Citizen Journalism Collective), or “we won’t give up” in Arabic, is an award-winning Moroccan citizen media organization started in 2011 as part of the youth-led February 20th movement’s efforts to reform the Makzhen ruling class under King Mohammed VI’s leadership. Mamfakinch provides alternative information largely unavailable in the Moroccan press to give voice to underreported issues. Whether its efforts are having any impact has not been causally linked (nor necessarily empirically researched). Nevertheless, owed to its presumed influence, in 2012, the Moroccan state allegedly infected its computer systems with spyware. According to its Facebook page, Mamfakinch is the “Moroccan Leading Citizen Media Portal.” As a citizen media organization, it operates out of a social movement, rather than a journalism paradigm. Like civic journalists, its members pursue an advocacy agenda. They do not pursue a gatekeeper role guided by norms of professionalism, at least as measured by the goal of achieving objective news coverage. Instead, they aim to cover and advocate on behalf of issues that are underreported or not reported at all.

Unlike professional journalists, its staff is not professionally trained. Like other citizen or community media organizations, they construct their

identity as insiders or outsiders to their advantage, arguing that they are better suited to the goals of advocacy because in the spirit of the Arab Spring, they are a part of the people. They therefore do not consider Mamfakinch a newspaper, at least not in a manner akin to what Moroccan journalism has come to symbolically represent, “a forum for oversight and distortion of key issues.” Therefore, they attempt to reform the established professional media from the outside. Its members, or those formerly known as the Moroccan audience, do so as a mobilized audience. They have moved beyond the active media paradigm to now participate directly in producing media. They do so not simply by responding to journalism (e.g., by writing letters to editors), but by producing user-generated youth media.

As a social movement operating in an age of mediated politics, they report not out of an interest in the practice of journalism, but on behalf of their cause. As part of the February 20th youth-led movement, and like similar social movements operating across north Africa, the Middle East, and Gulf during the Arab Spring, they began using media to protest. In their case, February 20th leaders led protests against the Makhzen state governing authorities and elites under King Mohammed VI’s leadership, mainly in pursuit of reform. Mamfakinch members regard journalism, or information more broadly, as a necessary

means to achieving such ends. Therefore, and specifically to foster democracy, freedom, and human rights, they advocate on behalf of the human right to information, rather than endorsing a specific political platform. By contrast, the right to information is not clearly enshrined in Moroccan law.

Democratization

By arguing on behalf of the right to information, Mamfakinch situates itself in relation to corollary data asserting that democracy and freedom of expression cannot exist without one another. However, Morocco is not a democracy, but an anocracy (a middling autocratic-democratic system). As part of larger reform and liberalization efforts, King Mohammed VI embarked on a process of transforming the kingdom's subjects into citizens, democratizing from above. Citizen media, on the other hand, seek to democratize from below. Unlike civic media professionals, community-based citizen organizations like Mamfakinch do not seek to provide the public with the tools necessary to become "good citizens," according to a state's predefined notion of citizenship. Rather, they seek to define citizenship on their terms and use their participation in media (and their products) to engage with and reshape the state, including by establishing and routinizing democracy.

Through the processes of such engagement, Mamfakinch in turn is trying to create not just a self-empowered citizenry, but an actual citizenry. To create this citizenry, along with systemic change, Mamfakinch provides the public with information otherwise unavailable. It does so by forging alliances with civic journalists, and specifically with members of the independent or alternative press (e.g., *Lakome* and *TelQuel*), which also provides information not otherwise available in Morocco (whether through its largely party-affiliated media system, or government-controlled sources).

In the beginning, Mamfakinch staff, comprised of volunteers who refer to themselves as activists and bloggers, began signing articles with the byline "Mamfakinch" or "Arab Spring." Presumably, they did so to prevent the Makhzen from infiltrating the organization, to maintain staff personal security, and to continue expressing their voices, in spite of statewide censorship, and self-censorship in response to presumed government arrest,

monetary fines and/or other adverse reactions to critical coverage. Since then, some authors, like cofounder Hisham Almiraat, have begun personally signing their bylines.

In terms of channeling, Mamfakinch's presence includes two Web sites, two Facebook pages, a blog site, a YouTube channel, a "Mamcast" podcast, a Twitter account, a Tumblr account, an RSS feed, and an e-mail listserv. Its main Web portal emphasizes news and commentary that is self-produced or culled from the Moroccan independent media and other independent or citizen media sources. The Web site blends Arabic with French, per the normative bilingual form *Darija* (Moroccan colloquial) Arabic assumes, in this case, by alternating between Arabic and French articles, rather than translating the two. In addition, it includes a streamlined English section. Its other Web site, called "Mamfakinch 24/24" No Concessions, emphasizes information about Mamfakinch, the February 20th movement, and links to its more overtly activist side, including its "Open Makhzen" Facebook initiative. The latter was created in conjunction with a protest that Mamfakinch organized to help combat rampant state corruption.

Mamfakinch supports domestic causes like reform, anticorruption, transparency, democratization, and the rights of women and the Amazigh (otherwise pejoratively known as Berbers), and international causes like Palestinian statehood. Its reporting and advocacy orientation concerning these and other domestic issues are underscored by a theme that, despite changes made by the state since the Arab Spring, these are in fact only cosmetic, making Morocco appear more progressive than it is in reality. At the same time, however, its reform agenda and critique of the state operate largely without crossing Morocco's "red lines." They do not transmit (or at least write) information critical of the king, to the point of suggesting that he should be overthrown (instead focusing on his need to reform his governing apparatus), or Islam. While they include articles referencing Morocco and Saharawi competing claims over Western Sahara, these tend to respond to an officially driven agenda, are limited in their framing of relevant actors and viewpoints and stop short of practicing peace journalism to advocate compromise on this intractable conflict.

Impact?

Whether Mamfakinch has had any impact with respect to (1) empowering and transforming its members into citizens through the process of learning to create and manage its volunteer organization, (2) (re-)setting mainstream media agendas and frames to open new spaces for public discourse, (3) influencing Moroccan elite and popular opinions, and (4) impacting policy processes to bring about systemic change, is unclear. Mamfakinch received the 2012 joint Google and Global Voices Breaking Borders Award. However, whether winning that award or achieving other ends has empowered its volunteers, and as part of that, what their chosen organizational structure has come to assume, has not been studied to make any empirical statements to any ends. Moreover, while members of the independent press follow them on Twitter, to what extent such uses, or Mamfakinch's overall practices have influenced discourse and in turn change, is neither clear. As Mamfakinch has noted, despite the cosmetic constitutional revision, real change in Morocco following the Arab Spring has not yet been achieved.

As is the case with any media source, especially those that have received critical acclaim, fear of Mamfakinch's impact, rather than its real impact, has created concern. Likewise, its exposure demonstrates that supposed technologies of freedom, in this case new digital networking tools, can be used by those seeking to further social justice just as easily as they can by those seeking to repress freedom of expression. To that end, hackers attacked Mamfakinch's computers on July 13, 2012.

According to its staff and as confirmed by the San Francisco-based Electronic Frontier Foundation, the organization received a message, which when opened, loaded eavesdropping spyware onto its computers. According to research conducted by Marquis-Boire at the University of Toronto's Citizen Lab, the downloaded remote control systems' Trojan malware was manufactured by the Italian-based Hacking Team. Hacking Team reports that they supply their malware to government law enforcement and intelligence agencies to investigate crime. However, as in other cases reported by political activists (whether or not these activists were arguably defined as legitimate criminals or terror operatives), commercial-grade tracking and monitoring malware have nevertheless been

used by governments to investigate political activity. Meanwhile, in this case, Marquis-Boire tracked the originating source of Hacking Team's malware to the Moroccan capital of Rabat.

Thus, given that Hacking Team only sells to governments, and that the Moroccan state critiques and harasses citizen activists and journalists, according to many scholars and activists, it is likely that the government made use of this software not to safeguard national security, but rather to hamper individual liberties. Namely, it hampered Mamfakinch's members' right to freely report about and attempt to reform the existing anocratic system. Such allegations in turn are a concern to those invested in social media practice and the potential impact that such practices might have on reforming and redefining future state-based citizenship rights globally.

Mashable

Mashable is an online news portal for digital developments and social media. It was founded in 2005 by Pete Cashmore as a blog when he was only 19 years old. The Web site attracted 20 million unique visitors per year as of November 2012. The main headquarters for the company is located in New York City, and an additional office is located in San Francisco. Mashable estimates that over 60 articles are tweeted per minute, and the writers cover such topics as social media advances and trends and how-to articles focused on various topics.

Designers also make sense of data through image-heavy infographics. The Web site showcases new tech and review gadgets, apps, and software. In addition, Mashable publishes business news from large tech companies to start-ups, as well as lifestyle and entertainment stories related to social media and technology. It is a multimedia mix of news with videos, blogs, news stories, and infographics. A new feature, Mashable Follow, is the site's content feed that lets users pick topics. In addition, Mashable Follow enables users to discover and follow their favorite topics, share stories with ease, follow social media friends and others who share their interests, customize their news feeds, and earn badges. These badges range from the "double rainbow," which focuses on connecting with two networks to "laughing baby," which highlights that a user follows five topics. Additional badges include hamster dance, early adopter, grade school, honey badger, I like turtles, I'ma let you finish, LOL cat, sad Keanu, and sneezing panda.

The Mashable Web site features the following links: top stories, trending topics, people, jobs, and events. In addition to the aforementioned links, Mashable categorizes news stories into the following types: social media, tech, business, lifestyle, watercooler, entertainment, U.S. and world, and videos. The following companies are global syndication partners: ABC News, CNN, Metro, and Yahoo!. Mashable is focused on maintaining a specific voice on the Web with their social media users. Through Cashmore's vision, Mashable maintains a limited scope to perpetuate creativity. Cashmore is focused on the quality of social media content, instead of merely the quantity.

In late 2012, Mashable announced a redesign of its Web site. This redesign incorporated cutting-edge technology and innovative technological designs to make the Web site more appealing in the social media atmosphere. A predictive engine called Mashable Velocity identifies content that is projected to go viral. To appeal to those who may use a variety of platforms (including cell phones, tablets, and computers), Mashable utilizes an adaptive and responsive design.

In 2012, Mashable played a sizable part in the U.S. presidential election, publishing political articles and videos on a daily basis. During the 2012 presidential campaign season, Mashable created a report titled "Politics Transformed: The High Tech

Battle for Your Vote." This report compiled information resulting from 13 different articles (resulting in 20,000 words) focused on politics from a digital point of view. Two of the articles in this series were titled "How Close Are We to Internet Voting," and "How Social Media Can Safeguard Your Vote." During this campaign season, Mashable proved its importance in digital campaign marketing, voter turnout efforts, and the importance of mobile devices in political campaigns. Through this campaign report Web site, users can read each article and send a tweet about it, "like" the article on Facebook, recommend the article on Google+, or share the article on LinkedIn.

In addition to political campaigns in the United States, Mashable also covers political campaigns around the world. Mashable also published the 13 virtual articles in its political report in an eBook of the same name. Users who purchase this eBook automatically gain access to four exclusive interviews. These interviews range from Adam Sharp (Twitter's senior manager of government, news, and social innovation) to Dana Chisnell (ballot design and usability expert).

Each year, Mashable, the 92nd Street Y, the United Nations (UN) Foundation, Ericsson, the Bill and Melinda Gates Foundation, and the UN Development Programme host a Social Good Summit. Through this three-day event, more than 300 attendees from various countries participate in dialogues focused on problem solving through social media and mobile technologies. This conference approaches social media and social good from a broader context: mobile technologies, spirituality, women and economic empowerment, citizen journalism, global health, and kindness. The event enables attendees and nonattendees to take part in the action by creating a Mashable Meetup called "Take Action." Speakers for the event range from Kathy Calvin (ceo of the UN Foundation) and Helen Clark (administrator of the UN Development Programme) to Larry Irving (cofounder of the Mobile Alliance for Global Good) to Todd Park (chief technology officer of the United States).

McCarthy, Kevin

Kevin McCarthy is a Republican and the majority whip in the U.S. House of Representatives. He has represented the 22nd District of California, but now represents the 23rd District. Kevin Owen McCarthy was born in Bakersfield, California, on January 26, 1965, the fourth generation of his family to be born in Kern County. When McCarthy was 19, he opened a deli called Kevin O's in order to achieve his goal of attending California State University in Bakersfield, from which he earned a B.S. in marketing in 1989. In 1994, he earned an M.B.A. degree. While in college, McCarthy became the chairman of the California Young Republicans. He was later chosen chairman of the National Young Republicans organization (1999–2001). After completing his advanced degree, McCarthy ran several small businesses. McCarthy still makes his home in Bakersfield, the ninth-largest city in California. In 1992 McCarthy married Judy Wages, and they have two children. He identifies himself as a Baptist and is of Irish ancestry.

Political Career

Beginning in the late 1980s McCarthy served as the district director for U.S. Congressman Bill Thompson. He remained in the post until 2002, when he was elected to the California State Assembly to represent the 32nd Assembly District. In 2002, Arnold Schwarzenegger also won the election for governor following the recall election that forced Governor Gray Davis from office. McCarthy served on the transition team, and later worked closely with Schwarzenegger. One project was to redraw

all electoral districts so that neither Democrats nor Republicans had a political margin greater than 7 percent among registered voters.

McCarthy served only two terms, or a total of four years, in the California Assembly. When Bill Thompson announced his retirement in 2006, after 28 years in the House representing California's 22nd District, it was just four days before the candidacy filing deadline. This gave possible opponents very little time to organize and launch a campaign. Thompson endorsed Kevin McCarthy for the seat he was vacating in Congress after McCarthy announced that he was entering the race. McCarthy easily defeated the opposition in the Republican primary, and then faced Sharon Beery, the Democrat Party nominee.

Beery was a newcomer to an election. She had been a Kucinich for President organizer in the central coastal region of California. She had been an educator, teaching for 22 years, and also a businesswoman. She won the endorsement of the California State Democratic Party, the California Democratic Council, and the personal endorsement of State Senator Dean Flores. She also gained the endorsement of ImpeachPAC, a federal PAC that funded candidates for Congress who would seek the impeachment of President George W. Bush, Vice President Dick Cheney, and others. Beery advocated bringing American troops home from Iraq immediately. She wanted to institute universal health care for all Americans and to stop the endless testing in the No Child Left Behind law. To promote her issues, she used a Web site that explained her positions on the issues in several languages. Her campaign also used Twitter, Facebook, LinkedIn, and e-mails.

McCarthy won with 70.7 percent of the vote to Sharon Beery's 29.3 percent. The victory was impressive because the election of 2006 was very favorable to Democrats. In the election of 2008 that swept Barack Obama into the White House, McCarthy had no opposition. In the 2010 election, he received 98.8 percent of the vote, with the remainder going to a write-in candidate.

Majority Whip and "WhipCast"

In 2011, McCarthy was chosen the majority whip by his Republican colleagues. The whip is a party official who is responsible for ensuring that the party rank and file will vote as the party leadership

wishes. The term comes from fox hunting, in which the individual who whips the dogs back into the pack to keep them in the hunt is known as a “whipper in.” The whip will get to know the members of the party, offering inducements and threatening punishments to ensure particular votes. The most important role is to see that members are in attendance on important votes.

In 2012, the official majority whip Web site began advertising a new social media app called WhipCast. It connects members of Congress, staff, and the public with new information and real-time updates on current affairs in Congress. The WhipCast mobile app is available for BlackBerry, iPhone and Droid phones. The majority whip Web site also features a “newsroom,” blog, and WhipCast connections.

2012 Election

The election of 2012 presented new and serious challenges for McCarthy because it was the first election in which California used its new Top Two Candidates Open Primary Act. The law forces all candidates to run in one blanket primary. The two top vote-getters then run in the general election in November. The law was the result of a California proposition. The claim of the supporters was that it would produce a more centrist result, with more moderates winning. More voters did participate, but the effect was to produce a super majority of Democrats in the California State Assembly. It also increased campaign spending, and with it the power of special interests. In seven of the congressional districts, there were Democrats battling each other after the primary in the general election.

Following the 2010 census, McCarthy’s district had been realigned when it was reapportioned. The realignment caused him to be displaced from the 22nd District. He then ran in the 23rd District to represent California in the House of Representatives. He replaced incumbent Lois Capps, who had been elected in 1998 in a special election on March 10, 1998, to fill the vacancy caused by the death of her husband, Congressman Walter Capps. She was displaced by the redistricting from the 23rd District to the 24th District, which she won. McCarthy remained the incumbent in the 22nd District until January 3, 2013, when he was sworn in as the representative for the 23rd District.

Committee and Other Memberships

McCarthy is a member of the National Council for a New America, which formed in 2009. The Council is composed of Republican Party members who are seeking to change the negative image of the party. They believe that Democrats have been successful in branding the Republicans as the party of “no.” The group was created by Eric Cantor and other party leaders. It uses social media formats such as YouTube in order to spread its message.

In the 112th Congress, McCarthy served on the House Committee on Financial Services. He is a member of two subcommittees: the Subcommittee on Capital Markets, Insurance, and Government-Sponsored Enterprises and the Subcommittee on Financial Institutions and Consumer Credit. In the 110th and 111th Congresses he also served on the House Committee on House Administration. The committee and the subcommittees use a variety of social media, including RSS (Really Simple Syndication) feeds, Twitter, YouTube, Facebook, and live Web casts.

Other Social Media Use

Congressman McCarthy’s official Web site uses links to videos. It also has links to Twitter, Facebook, YouTube, and Flickr. There are links to a “Help Center,” “Biography,” “Media,” the “District,” and other links including “Share.” There is an area in which visitors can sign up to get “Washington Updates.” Some of the statements can be downloaded. There is also a link that takes the viewer on a virtual tour of Washington, D.C.

McCarthy’s official congressional Web page also has a reading list, including such current works as *The Forgotten Man: A New History of the Great Depression*, *Lincoln on Leadership: Executive Strategies for Tough Times*, and *presidential Courage: Brave Leaders and How They Changed America 1789–1989*. The page can be shared via Facebook, Pinterest, Twitter, LinkedIn, Digg, Tumblr, Reddit, and StumbleUpon, and a large number of other social media links from Blogger to Evernote and Myspace.

McCaskill, Claire

In her recent re-election campaign, Missouri Senator Claire McCaskill was frequently stuck between a rock and a hard place. As a moderate Democrat in a state where the Tea Party has a rather strong following, McCaskill needed to separate herself from the policies of President Barack Obama. At the same time, as a Democratic Senator in a red-leaning state, Obama was likely to frequently call on her to attend rallies with him and aid in his fundraising efforts. As the Republican primary season raged on (with multiple strong Republicans in the Missouri race), McCaskill began setting her sights on U.S. Representative Todd Akin. She identified him as the most beatable of her potential opponents, and ran ads discussing Akin's true conservative values. Then Akin won—and opened his mouth.

When asked in a radio interview if women who are raped should have the option of abortion, Akin replied that,

Well you know, people always want to try to make that as one of those things, well how do you, how do you slice this particularly tough sort of ethical question. First of all, from what I understand from doctors, that's really rare. If it's a legitimate rape, the female body has ways to try to shut that whole thing down. But let's assume that maybe that didn't work or something. I think there should be some punishment, but the punishment ought to be on the rapist and not attacking the child.

The Akin campaign went south shortly thereafter, and permitted McCaskill—who had been largely assumed to be one of the most vulnerable incumbents in 2012—to claim a 15 point victory and a second six-year term. Throughout the campaign, McCaskill remained one of the most prolific utilizers of social media in Congress.

McCaskill has served six years in the U.S. Senate as a Democrat, and has been senior senator for the state since 2010. She defeated incumbent Jim Talent during Obama's presidential election. Prior to the Senate, she was a member of the Missouri House and Jackson County Prosecutor before serving two terms as state auditor. In 2004, she ran a failed bid for the governorship. An early adopter, McCaskill has been recognized as one of Congress's most effective social media users. What makes her social media presence so appealing is her regular inclusion of everyday items into her messages; she does not simply use new technologies to disseminate official messages.

Northwestern University's Medill School of Journalism rated McCaskill as one of the four most effective users of social media in Congress. Experienced with both Twitter and Facebook, McCaskill regularly talks about items of common interest, along with serious political matters. Perhaps most impressively, the senator is personally responsible for all of her messages, and personally responds to posts and tweets. Staff do not have access. When thinking about the more serious realm, McCaskill writes in a way that is relatable for average Americans and regularly portrays her as any other human being. She sent

Senator Claire McCaskill shakes hands with Chairman of the Joint Chiefs of Staff General Martin E. Dempsey on April 17, 2013, at the Senate Hart Office Building in Washington, D.C. Senator McCaskill is one of the more effective members of Congress on social media; she was named one of the Top 10 Notable People on Twitter by Time magazine.

this tweet before a lengthy debt ceiling session: “Taking a blanket and pillow to the Capitol. #neveragoodsign.”

Researchers have taken to using McCaskill as an example of what good social media politicians look like. Yet, McCaskill on Twitter is quite different than the personality she presents on Facebook. On Twitter, McCaskill is informal, down-to-earth, and even folksy; on Facebook, she is policy driven and formal. This appears to relate to her personal preference in platform. McCaskill, from the beginning, has always seemed to prefer Twitter. She is one of *Time* magazine’s Top 10 Notable People on Twitter, and has successfully intermixed politics and personality in the character limit. She uses it as a personal outlet, rather than a campaign tool. As a result, when she mentions politics, she’s seen as genuine. On Facebook, however, she is by no means colloquial

or impactful. She is formal and professional. As a result, many have overtly wondered how she managed to master one vehicle while struggling so heavily with another.

McCaskill’s social media prowess is statistically supported. OhMyGov rates McCaskill 37th in its social media power ranking. This ranking is calculated using her 88,000 Twitter followers, 14,000 Facebook fans, 3,500 tweets, and 1,300 mentions per week. With a Klout score of 81, average citizens are likely to be exposed to McCaskill’s words. However, it is how she uses social media that allows her to be seen as successful. McCaskill’s most memorable utilization of Twitter was in May 2011. It did not involve politics, policy, or even the country. Instead, it involved her weight. McCaskill tweeted that: “Maybe talking about it publicly will keep me on track as I try to be more disciplined. Off to

the gym.” After meeting her goal, she tweeted the news. Hundreds of individuals offered encouragement throughout the process.

While she did not attract them for her politics, she has connected with them, meaning that they are significantly more likely to read whatever she chooses to send out politically. Rather than forcing politics on people, McCaskill has successfully shown how social media can be used to bridge relationships, which opens doors for political conversations later on.

McConnell, Mitch

Mitch McConnell was elected to the U.S. Senate in 1984 as a Republican from the Commonwealth of Kentucky. In 2006, he became the minority leader of the U.S. Senate, and has served continuously in that role through the 113th Congress. Like most Senate leaders, McConnell is considered highly partisan; his comment that the single most important thing for Senate Republicans to achieve during President Barack Obama’s first term would be to ensure that Obama served only one term was largely seen as a polarizing comment. McConnell is a strong conservative, but is not a Tea Party favorite, and periodically casts votes that are in

conflict with other conservatives. He is an effective fundraiser for himself and his party, and is an opponent of most campaign finance reform (opposing McCain-Feingold, for example).

McConnell’s first campaign for the Senate, against incumbent Walter “Dee” Huddleston (D-KY), was hard fought and narrowly successful. That campaign exemplified the power of traditional media as McConnell’s “Bloodhounds” commercials were seen as effective attack ads: they made hard-hitting political points in a humorous way. In one commercial, bloodhounds are tracking Huddleston, who appears not to be on the job, but rather picking up checks from special interest groups in exotic locations. In another, Huddleston is portrayed as running away from his record before being treed by the bloodhounds.

Social Media Use

As the media world has changed, though, McConnell has changed with it. McConnell has a presence on Facebook, YouTube, and Twitter. He also has a traditional Web site, and uses e-mail to send regular newsletters to those who subscribe. As the minority leader, he also plays a role in coordinating messaging among Republicans.

McConnell’s official Senate Web site is attractive and traditional. It has a general red, white, and blue color scheme with a bright red cardinal, the Kentucky state bird, in the upper left-hand corner, and McConnell’s picture prominently displayed in the center. Links are also prominently featured to provide access to a variety of constituent services, including flag requests, help for those visiting Washington, D.C., and federal casework.

Links on McConnell’s Web site will also take one to his comments on select issues, biographical information, and a page that details the Republican Senate leadership. There are also links that will take visitors to audio, video, and photo content.

One prominent difference between McConnell’s Web site and that of most senators is that his page highlights some leadership issues. In late 2012, for example, McConnell included comments on Majority Leader Harry Reid’s (D-NV) plan to change the filibuster rule, and a call on President Obama to provide leadership regarding the impending “fiscal cliff.”

The Web site, while reflecting Republican talking points, is primarily aimed at constituents, and promotes the roles of McConnell as a representative of the citizens of Kentucky and a vote-seeker from those constituents.

McConnell was not quick to take up Facebook. He joined Facebook in June 2010, and his Facebook page uses a standard layout to attract modest traffic and nearly 10,000 “likes.” If one is keeping score, Majority Leader Harry Reid (D-NV) has almost four times as many likes. McConnell’s Facebook page has content similar to his official Senate Web page—some discussion of Senate leadership and partisan issues, as well as some policy comments—but it also has content that is more casual and reflects his home state interests. Also different is that it lacks the systematic attempt to reach out to constituents with offers to provide services (e.g., providing flags flown over the Capitol Building, or help with federal agencies).

What is also distinctive about McConnell’s Facebook page is the large number of negative comments on the page. Those comments are not notably different from that of other congressional leaders, but reflect the terrain that political leaders (and anyone else) must navigate when using social media, particularly Facebook. When negative comments are made, do you allow them to stand? Removing them subjects the page holder to cries of censorship, and seems to undermine the purpose of the page to engage in social or political interactions with others, in this case the public. Leaving negative comments posted, though, can make a negative impression. While there is no articulated policy on McConnell’s Facebook page regarding what content is left and what is removed (in contrast to Reid, who articulates his policy in an obvious way), it appears that McConnell allows the bulk of negative comments to remain posted.

McConnell created his YouTube channel in January 2009. He uploads on a reasonably regular basis, having about 400 videos online at the beginning of 2013. At that same time, he had about 850 subscribers, and the videos had about 300,000 views. The vast majority of the videos are Senate floor comments made by McConnell, but there are also a small number of interviews with traditional news media posted. There is also

a smaller number of other videos dealing with miscellaneous events, such as comments made during a ceremony bestowing a Congressional Gold Medal to Burmese opposition leader Daw Aung San Suu Kyi.

McConnell’s Twitter account is labeled as run by his press office; he has no evident personal account from which he personally tweets. As of the start of 2013, McConnell’s office had tweeted about 1,600 times, with about 6,700 followers. In comparison, Reid had about the same number of tweets, but about 74,000 followers. Reid tends to comment on issues of the day, whereas McConnell has been more likely to comment on issues of interest to his state, such as where he is appearing and his support of the University of Louisville joining the Atlantic Coast Conference. His issue content seems to be increasing over time.

McConnell also e-mails a newsletter every two weeks to those who are on his mailing list. The newsletter generally lacks issue content, and tends to talk about personal appearances in the Commonwealth of Kentucky or recent nonpolitical events. The newsletters have links to his official Senate Web site, as well as to his Facebook and YouTube pages and his Twitter account.

Additionally, McConnell has both an independent Web site and a separate Twitter account for his campaign. His campaign site is more political, and has links to enable one to easily contribute money or to volunteer. His campaign Twitter account had about 300 tweets and 2,000 followers recorded at the beginning of 2013.

Overall, McConnell has a presence across social media, but is not a heavy user, and his use seems to be narrow in purpose. They do not form what seems to be a primary means of waging political battle. Maybe that limited use can be attributed to the fact that as minority leader of the Senate, he has plenty of other venues. It should not be surprising that the most content-heavy medium he uses is YouTube, where he routinely uploads floor comments. Since he is a regular presence on the Senate floor, he has many opportunities to do so.

Social Media and the Fiscal Cliff Issue

It is not clear that McConnell differentiates among the various social media venues. An analysis of his social media activity on the two big issues following the 2012 elections may provide

some insight. One issue was how Congress and the president would deal with what was labeled the “fiscal cliff,” a key policy issue, and the other was the threat by Majority Leader Reid to change the filibuster rule, a key institutional issue critical to McConnell’s role as minority leader.

The so-called fiscal cliff issue was a result of the inability of Congress to deal with the large federal deficit in any systematic manner. In 2011, Congress struggled to pass legislation to extend the debt ceiling. As part of the efforts to deal with that issue, as well as the large deficits, Congress passed and the president signed the Budget Control Act of 2011. The act created what was called the Super Committee, a joint select committee, with the mandate to propose a plan that would reduce the deficit by \$1.2 trillion over 10 years. If it failed to do so, a number of fiscal actions would automatically take place beginning in 2013. The failure of the committee to develop an acceptable plan left the nation facing consequences virtually no one saw as desirable. Among the actions that were to take effect were the expiration of the Bush tax cuts and cuts in a wide range of domestic and defense spending programs. Congress and the president, then, spent the time between the election of 2012 and the start of 2013 trying to develop an alternative.

Immediately after the election, President Obama claimed that his victory meant that he had a mandate for his plan. However, shortly after the election, McConnell posted on his various social media a link to a *Wall Street Journal* story where he said that he and other Republicans thought that they had a mandate to not raise taxes. Battle lines were drawn, and after the president’s success with various social media, it would be reasonable to expect that the social media would play a role in this debate. Indeed, the White House got a lot of play out of asking Americans to tweet what they would do with the \$2,000 they would not lose if Congress immediately extended tax cuts for everyone but the wealthy. McConnell’s use of social media, though, was minimal and uncreative by comparison.

Social Media and the Filibuster Issue

The filibuster issue arose when, immediately after the 2012 election, Majority Leader Reid indicated that he was willing to use the “nuclear option” to

change the filibuster rule in the U.S. Senate. Many experts believe that when the Senate adopts its rules on the first day of a new session, the change could be made by a simple majority vote. While changing the rule is controversial and support often depends on whether one is in the majority or the minority, many people see the Senate as too cumbersome on important matters, and that some change would be beneficial to the ability of the Senate to conduct its business. Whether changing the time-honored tradition of the filibuster would be a positive step in that direction and whether the rights of the minority could be preserved was the debate.

In the end, the outcome of both issues depend on the votes of the nation’s elected officials, but there were important public components to both discussions, and the ability to frame the way the issues would be perceived was important.

Analysis of McConnell’s Senate Web site, Facebook, YouTube, and Twitter activity shows that both issues were clearly on McConnell’s mind. He was frequently quoted in the traditional media on those issues, and was actively engaged in discussions on both. It was also clear that social media were not central to his public approach to these issues. The general pattern McConnell followed when he wanted to publicly share something was to make a statement on the Senate floor, issue a traditional press release of those comments, and then post either the video or the press release to his various social media. For example, on November 29, 2012, McConnell issued a press release summarizing his floor comments, called “Raising Tax Rates During Job Crisis is ‘Last Thing We Want to Do.’” Video of those floor comments were put on his YouTube page, and the press release was also put on McConnell’s official Web site, his Facebook page, and tweeted. He also broke with his normal pattern and posted the same material in his e-mailed newsletter.

McConnell made no effort to target the content of his comments on either issue by modifying the presentation of his views, either by style or substance. There is no evidence that he differentiates among issues or his audiences, but rather sees them through the same eyes. He seems to use these social media because they are there and available, but they do not seem to serve any strategic purpose.

Conclusion

In sum, McConnell has a presence across the most popular social media, but he is not a major participant. As a summary of his social media presence, McConnell's Klout score is a modest 45. As comparisons, Majority Leader Reid's is 53, and Senator Al Franken (D-MN) has a score of 82. McConnell's use of social media seems to arise from the necessity of using them, rather than as central to any political strategy. There is never any sense that McConnell is personally involved in any messaging. In fact, it seems that the use of the social media is driven by McConnell's focus on traditional media. Nor is there anything particularly creative about his use. He certainly has never done a Reddit "Ask Me Anything." As a Senate leader, he has good access to the traditional media, and has been more likely to rely on them rather than to develop an independent social media strategy.

McCotter, Thaddeus

Republican Thaddeus McCotter served as the Representative from Michigan's 11th Congressional District to the U.S. House of Representatives from 2003 until July 2012, when he abruptly retired from Congress following a major scandal involving his staff.

Thaddeus "Thad" George McCotter was born August 22, 1965, in Detroit, Michigan. His father, a public school teacher, died when he was just 13 years old. He attended Detroit Catholic Central High School, graduating in 1983. He then graduated summa cum laude from the University of Detroit in 1987, with a B.A. In 1990, he graduated from the University of Detroit with a J.D. McCotter entered private law practice after graduation from law school. His wife, Rita Michel McCotter, is a practicing nurse. They have three children and live in Lavonia, Michigan. The family is Roman Catholic.

Political Career

In 1992 McCotter was elected to the Wayne County Commission, which is responsible for administering the county government and its local services. He served on the commission until 1998. During his service, he sought to change the county charter to protect taxpayers. His goal was to require new taxes be allowed only with an approval of two-thirds of the commissioners and 60 percent of the voters. In 1998, McCotter won election to the Michigan State Senate. He served there for four years. Following the 2000 census, he helped to redraw the legislative districts in Michigan, including the 11th Congressional District.

McCotter won the Michigan 11th Congressional District seat to the House of Representatives. The district covers Detroit's northwest suburbs and includes Livonia, Westland, and Novi. He entered office in 2003, and served until July 6, 2012, when he resigned.

Traditional Media

McCotter's appearances in traditional media include guest spots on a variety of television and radio shows. He was a regular on the television show *Red Eye with Greg Gutfeld*, and radio talk show host and comic Dennis Miller hosted him on his show numerous times.

McCotter authored the book *Seize Freedom!: American Truths and Renewal in a Chaotic Age*, which was published by the Intercollegiate Studies Institute. He also wrote for the *American Spectator*, the *Detroit News*, *Human Events*, and Andrew Breitbart's site *Big Hollywood*, as well as many other publications and partisan Web sites.

Committees and Subcommittees

In Congress, McCotter was assigned to the House Committee on Financial Services. He was a member of three of its subcommittees: the Subcommittee on Capital Markets, Insurance, and Government-Sponsored Enterprises; the Subcommittee on Financial Institutions and Consumer Credit; and the Subcommittee on International Monetary Policy and Trade.

The Subcommittee on Capital Markets, Insurance, and Government-Sponsored Enterprises in the 112th Congress was focused on the financial difficulties of the federal lending agencies, Fannie Mae and Freddie Mac, which were still embroiled in the subprime lending crisis. More specifically, the goal of the Republicans, including McCotter while he served in 2012, was to deal with bailouts for troubled federal agencies. All three subcommittees use social media extensively. Besides videos, e-mail, and blogs they also use Really Simple Syndication (RSS) feeds, Twitter, YouTube, Facebook, and live Web casts.

In addition, there is a link on the official Committee on Financial Services Web site to a "Minority Site," which is hosted by the Democrats. Their site has numerous links, but it does not have as many social media features as the site for the majority. The most important social media link is the RSS link. RSS allows readers such as Google Reader or Bloglines to be used to display feeds from multiple Web sites.

Caucuses

Caucuses to which McCotter belonged included the Congressional COPD Caucus, the House

Sovereignty Caucus (cofounder), The International Conservation Caucus, and the Sportsmen's Caucus. The Congressional COPD Caucus is focused on chronic obstructive pulmonary disease (COPD). The Caucus is linked with the U.S. COPD Coalition. The Coalition uses Facebook and is linked to Drive4COPD, which uses a number of social media.

The House Sovereignty Caucus was founded by McCotter, along with another member of Congress. Their goal was to inhibit some in the government from engaging in agreements with foreign powers that would reduce the sovereignty of the United States. The Caucus Web site uses a number of social media links.

The International Conservation Caucus is composed of members of Congress who believe that the United States should promote conservation of natural resources. The mission of the Caucus is to provide strong American leadership in order to conserve biologically rich and diverse places around the world. The caucus uses hot links on its site, but does not use any social media.

With over 300 members from both the House and the Senate, the bipartisan Congressional Sportsmen's Caucus (CSC) is one of the largest and most effective caucuses in the Congress. Its members are from most of the 50 states. The CSC has a site with links to commercial sporting outfitters such as Cabela's. The CSC can be followed on Twitter and Facebook.

McCotter was also a member of the Republican Main Street Partnership, which is considered a moderate group. It uses Facebook, Twitter, and other media. He was also a member of the Republican Study Committee, which is a conservative group. It uses RSS, Twitter, Facebook, and YouTube.

Campaigns and Elections

In the 2004 elections, McCotter defeated Democrat Phillip S. Truran from Novi, Michigan. Truran was president of the Communications Workers of America Local 4013. He had won the Democrat Party Primary with 68.9 percent of the vote, defeating Mario Fundarski. In the 2006 election McCotter did not have any Republican opposition to face in the primary. In the general election, he faced Democrat Tony Trupiano. A progressive radio talk show host from Dearborn Heights,

Thaddeus McCotter speaking at the Iowa State Fair in Des Moines, Iowa, on August 12, 2011. He lost the Ames Straw Poll, held the next day, garnering only 0.2 percent of the vote.

Trupiano was not the challenger. John Tatar was the Libertarian Party nominee, and Charles Tackett was the U.S. Taxpayers Party nominee. The candidates met for debate at a League of Women Voters forum in the middle of October. McCotter won the election with 55 percent of the vote.

The election of 2006 was costly for the Republicans; however, McCotter was confident that he would win his re-election. He made a \$250,000 contribution to the National Republican Congressional Committee. After the elections, with many losses for the Republicans across the country, they found that they were the minority party in the House of Representatives. McCotter was elected chairman of the Republican House Policy Committee. The Policy Committee is the principal forum for Republicans to develop forward-looking and principled policy solutions. Its Web site makes extensive use of social media such as

Twitter, Facebook, RSS, and YouTube. Election as chairman made McCotter a top-ranking House Republican. It was a position sought by Congressman Darrell Issa of southern California.

In the election of 2008, the Democrat challenger was Joseph Larkin. He also had to defeat the Green Party candidate Erik Shelley and the Libertarian Party candidate John Tatar. He had defeated Tatar in the 2006 election. McCotter received 51 percent of the vote, which was much better than the opposition's fragmented voting returns.

In the election of 2010, Natalie Mosher, a Democrat, was McCotter's opponent. She was a nonprofit organization management consultant and contractor. She was the first woman to run for Congress in the 11th District. Her campaign made extensive use of Twitter. It also used ActBlue, LinkedIn, and GoDaddy.com. McCotter defeated her with 59 percent of the vote to her 39 percent.

In May 2011, McCotter made a run for the Republican nomination for the 2012 presidential election. A surrogate paid the \$18,000 fee to allow him to enter the Ames Straw Poll auction in Iowa. On July 2, he announced his presidential candidacy in Whitmore Lake, Michigan, at a rock music festival.

From the beginning of his campaign, McCotter was unable to mount significant interest in his campaign because of his lack of name recognition. When the Ames Straw Poll was held in August 2011, he came in last, with less than 1 percent of the vote. Ending his campaign for the presidential nomination on September 22, 2011, he said that his candidacy had been hurt by his exclusion from the presidential debates and media inattention.

Social Media Use

McCotter made extensive use of social media in order to proclaim a conservative message on issues important to conservatives. He unwaveringly articulated conservative views in every available medium via Facebook, Twitter, and Red Eye, as well as traditional media such as Fox News. His 2012 campaign Web site had links to Digg, Facebook, StumbleUpon, Reddit, Twitter, LinkedIn, Newsvine, Pinterest, Google+, and more.

2012 Scandal

On May 25, 2012, while McCotter was on a congressional trip to Taiwan, Michigan Secretary of

State Ruth Johnson announced that he had failed to qualify for the Republican primary to be held on August 7. It was the first time that a sitting member of Congress had not qualified for his party's primary since the 1940s.

In Michigan, a candidate for a congressional seat has to submit a petition with at least 1,000 signatures of voters in order to qualify for their party primary. McCotter's 11th District office staff had failed him. They had not gathered the necessary signatures, so they had forged or duplicated those that were needed. This left McCotter with the option of running as a write-in candidate in the primary. As the scandal unfolded, four of McCotter's district office aides were arrested and charged with multiple counts of voter fraud. Subsequent research found fraudulent names on qualifying petitions for earlier elections.

On June 2, 2012, McCotter announced that he was not going to seek re-election, but would complete his term of office. Then, on July 6, he abruptly announced his resignation from office and withdrew to private life.

Media and Communication Policy

Communication policies are developed by the government to achieve a specific goal in media industries. They are the result of interactions between government and industry, and reflect the development of media technologies. As new forms of media have developed throughout history, so have the ways in which media are regulated.

Historian of American media Christopher Sterling suggests that American communications policy includes private sector ownership and operation, and public sector regulation and control. He proposes that the basic foundation for communications policy in the United States entails two parts of the U.S. Constitution: Article 1 Section 8 (1789), which gives Congress the power "to regulate Commerce with foreign Nations, and among the several States"; and the First Amendment (1791), which defined government control over communication content (freedom of speech or of the press). These areas of the Constitution have laid the foundation for media policy in the United States by defining government regulatory structure over technology and communication content.

Media Policy Phases

Communication policies in the United States can be defined by three phases. The first phase of media policy was developed to regulate emerging media technologies, such as the telegraph, telephony, and wireless communications. Sterling suggests that initial legislation on telecommunications was concerned with "maritime applications of wireless." These provisions established the requirement for federal licenses to access the spectrum. With little regulation, media industries developed to form a private monopoly. The government's response to this activity was to support communication policies that enforced an anti-trust environment and advance industry competition and profitability. As industries developed, emerging legislation and regulation of the radio during the 1920s and 1930s helped to usher in a new form of control where the public's interest was prioritized over commercial interests (e.g., the Radio Act of 1912 and the Communications Act of 1934).

The second phase of media policy was characterized by sociopolitical concerns, and was influenced by postwar social reform. Concerns over freedom of the press, diversity of voices, providing trustworthy information, and quality programming were all supported by government regulation. The Federal Communication Commission (FCC) made attempts to regulate these concerns by reminding broadcasters of their commitment to serving the public (e.g., the 1946 FCC Blue Book).

Sterling suggests that from 1956 to 1969 the federal courts and the FCC made a number of amendments that impacted these issues, such as common carrier regulation. These series of decisions led to the separation of monopoly-regulated services that hindered competitive competition. Politics of the 1980s in conjunction to such rulings later prompted deregulation during the 1990s. The domination of centralized media industries, fragmented audiences, and new communication technologies, which defined the media policy landscape of the 1980s and 1990s, have led to emerging concerns for new communications policy.

The new communications policy phase is defined by changing social, political, and economic advances in American society and abroad. Technological advances have led the government and industry to be concerned with new international markets and economic interests. Globalization has impacted media policy in that it has opened the boundaries to share and receive media in different ways. Additionally, the convergence of media has also impacted the ways in which policy has been defined. The Telecommunications Act of 1996 reflects the growing concern to foster competition by deregulating the industry.

Sterling suggests that the government and industry now face new concerns with the development of new media technologies. The policy concerns in essence remain the same to the extent to which the government is to ensure the quality of services in privately owned and operating digital platforms. The Internet and social media have developed in the absence of any regulatory framework; however, emerging concerns over national security, confidentiality, and copyright infringement have sparked debates about if and how to regulate the Internet and social media.

The Internet and Social Media

Countries around the world have been faced with the challenge of creating communication policies to regulate the ways in which the Internet and social media are being applied for collaborative and personal use. Government regulation of the Internet has dealt with concerns over access to information, rights of copyright holders, pornography, privacy, cybercrime, piracy, and illegal downloading, among others. The FCC and Congress are under pressure to address these issues and other concerns that impact the ways in which content is used and shared over the Internet (e.g., the 1998 Digital Millennium Copyright Act [DMCA]).

Recently, there has been an increased effort to control online activity. The U.S. House of Representatives has introduced two bills, the Stop Online Piracy Act (SOPA) and the accompanying legislation in the Senate, Preventing Real Online Threats to Economic Creativity and Theft of Intellectual Property Act (PIPA). The intent of both legislations is to combat the sale and distribution of pirated copyright material via the Internet, such as music and movies. However, the bills have been met with controversy and resistance from online creators. Such legislation could eliminate sharing and collaboration, which fuel innovation on the Internet. These debates point to issues of censorship and blocking the free flow of information that the Internet provides.

As social media continue to develop in their application and use by individuals, it will become imperative to ensure that policies geared toward the new medium will be able to delineate the issues of control, censorship, piracy, freedom of information flow, and diversity of voices. The policy debates will continue as social media provide new common spaces that collapse the traditional and new media in reconfigured forms.

Media Research Center

The Media Research Center (MRC) is a watchdog advocacy group that uses its multiple divisions to research and report on cases of possible liberal bias in the news media. Founded in 1987 by L. Brent Bozell III, the MRC has gained notoriety by its extensive quantitative and qualitative research projects that commonly analyze the newscasts of major broadcast and cable news networks. MRC researchers often employ content analysis, looking for examples of bias in the news media through the selection of stories, sources, and reporters' word choices, among many other aspects of their coverage.

Newspapers and their online companions, the *New York Times* in particular, are also frequent targets of the MRC's pursuit of exposing a left-wing agenda in newsrooms across the country. While many journalists and academics contend that there is no liberal bias, the MRC backs its claims with research that it displays on its Web site and distributes through numerous social media platforms. The Alexandria, Virginia, based organization has effectively used the Web and social media to bypass the many traditional media outlets it routinely critiques. The MRC's popular Twitter account @newsbusters, with over 68,000 followers, tweets numerous links a day that illustrate examples of biased media coverage. It also employs e-mail blasts and e-newsletters to drive traffic to its Web site.

Structurally, the MRC is broken into multiple divisions, including: the News Analysis Division, which monitors print and electronic media

coverage on a daily basis to detect examples of bias; the Business and Media Institute, which uses financial data to promote a free enterprise culture; the Culture and Media Institute, which promotes what are described as "traditional American values"; and its Cybercast News Service (CNSNews.com), which distributes news programming from a right-leaning perspective.

Bozell, who first gained national recognition in the early 1980s by working with the National Conservative Political Action Committee, is a frequent television and talk show guest, where the conversation usually revolves around media bias. After developing some political clout by advancing the Barry Goldwater/Ronald Reagan movement, Bozell turned to media criticism and started the MRC in October 1987. In an effort to bring light to the ongoing debate regarding a left-wing bias in the media, Bozell and his team became pioneers in supporting their claims about an oft-debated issue with credible and reliable scientific data falling within established margins of error.

Supporting his claims with data has not prevented numerous news media operations and other left-wing advocacy groups from lambasting Bozell as also having biases. That criticism from the left, however, is what helped Bozell turn his former grassroots operation into an influential Washington political force. In 1995, Bozell once again became a lightning rod of criticism when he parlayed his growing status in the media to found the Parents Television Council (PTC). This group, a joint effort with the Catholic League, gained attention for castigating the landscape of broadcast television programming as less than family friendly.

Syndicated radio host Rush Limbaugh often references Bozell and the MRC's research when he criticizes the left-wing establishment. Other conservative media figures such as Ann Coulter, Mark Levin, and William Bennett routinely laud the MRC's work on radio, television, and the Web. Bozell is also a frequent commentator on FOX News, the highly rated Sean Hannity program in particular. FOX programming provides Bozell and other MRC representatives an outlet to identify examples of mainstream media members acting in a manner sympathetic to the liberal point of view. According to the MRC, a common

perpetrator of using a liberal agenda in the guise of objective reporting is NBC and its cable companion MSNBC.

Aiming its criticism at MSNBC, in turn, has given Bozell and the MRC plenty of attention on FOX's rival network. MSNBC often bases its criticism of Bozell and the MRC as just mouth-pieces of conservative ideology with flawed research methods. Other vociferous opponents of the MRC include left-wing groups such as Media Matters and FAIR (a similar organization that researches media content). Liberal publications, including *Mother Jones* and the *Huffington Post*, contend that Bozell's research methods are skewed in order to represent that a liberal bias exists.

In spring 2013, the trial of Dr. Kermit Gosnell, a Philadelphia-based doctor who performed numerous late-term abortions, served as a focal point of the MRC's contentions of a biased news media. Bozell contributed to a letter written to the broadcast networks, calling on them to "stop censoring coverage of the trial." The MRC's research demonstrated that ABC's *Good Morning America* and *World News Tonight* gave the sensational Gosnell story a blackout of news coverage, while CBS and NBC awarded it miniscule coverage. In particular, MRC research found that *Good Morning America* devoted 109 minutes over a 42-day period to other sensational trails occurring at the time, including the one of Amanda Knox, but absolutely zero time for the controversial Gosnell case. The MRC contends that the networks avoided the gruesome details of the Gosnell trial in order to protect the liberal narrative regarding abortion that they prefer to provide viewers.

A year prior to the Gosnell case, the MRC used the Trayvon Martin case to identify flawed mainstream news coverage regarding racial issues. In April 2012, the MRC called upon Congress to:

. . . investigate Comcast/NBC News for the intentional editing of the George Zimmerman audio that was broadcast multiple times and subsequently flamed the fires of racial hatred and animosity.

Applauded by the right while chastised by the left, the MRC has received the attention it needs

to become a key figure in the partisan wars of today's media culture. In less than 30 years, it has evolved into one of the country's most recognized political think tanks and advocacy groups.

Medicare

Medicare is the federal health insurance program for people who are 65 or older, those under 65 with certain disabilities, and people with end-stage renal disease. Since its implementation in 1965 under Title XVIII of the Social Security Act, Medicare has become a social insurance program that provides health and financial security for vulnerable members of the population. Especially considering the fact that roughly half of all seniors did not have medical insurance prior to 1965, it is no exaggeration to state that the Medicare program dramatically improved access to medical care for a vulnerable and underserved population. Medicare provided health insurance coverage to 47 million people in 2010, including virtually all seniors (39 million), as well as 8 million people under age 65 with permanent disabilities.

Overview

The current Medicare program covers a range of health care services, including hospitalizations (Medicare Part A, hospital insurance),

outpatient physician services (Medicare Part B, medical insurance), and prescription drugs (Medicare Part C, prescription drug coverage). Medicare is primarily financed through general revenues, payroll tax revenues, premiums paid by beneficiaries, and other sources. Medicare has been generally well received by the public, while facing real changes of rising cost and funding limits. Due to increasing health care costs and a rapidly aging U.S. population, total Medicare spending is projected to be a much larger part of the federal budget, increasing from \$523 billion in 2010 to \$932 billion by 2020. Indeed, the Pew Research Center released a 2006 report stating that 62 percent of the public said addressing Medicare's financial problems should be a high priority for the government.

Besides the financial issues, Medicare and its operation are controversial topics among many citizens. The Medicare Part D coverage gap, also known as the Medicare donut hole, was one of the most problematic parts of the Medicare program. The coverage gap is a temporary limit on what the drug plan will cover. The Patient Protection and Affordable Care Act (ACA)'s proposal was to gradually offer coverage to those affected by the donut hole, starting in 2010, and to completely close it by 2020. As a result of this measure, Medicare beneficiaries had saved \$4.1 billion on prescription drugs as of August 2012, making it a strong selling point of the new legislature.

Role of Social Media

On the issue of Medicare, social media are often used to reflect public opinions or concerns. Especially since the ACA passed in 2010, Internet users have been voicing their support or frustration on blogs, Twitter, and Facebook. For example, when Republican Paul Ryan of Wisconsin offered a 2011 budget proposal titled "The Path to Prosperity," which would keep Medicare intact for people 55 or older but make dramatic changes on the program for everyone else by privatizing it and providing government subsidies, Democrats responded with the statement that "Republicans voted to end Medicare." When this Democratic Party's claim was named the "Lie of the Year" for 2011 by the PolitiFact.com Web site, a Pulitzer Prize-winning fact-checking site, it triggered

a heated discussion between conservative and liberal bloggers. The New Media Index from the Pew Research Center's Project for Excellence in Journalism indicates that the debate over the Lie of the Year for 2011 was one of the most discussed topics in social media platforms.

Estimated to cost \$617 billion in 2015, Medicare influences millions of beneficiaries and is a key payer in the U.S. health care system. Needless to say, many constituency groups have a vested interest in Medicare reform and are active on social media. KBM Group, a research and consulting organization, issued a Listening Report of Medicare-related activities on social media, which found that the majority of conversations are made by Medicare experts, followed by laypersons wanting more information. There are also professional bloggers and journalists, who use social media forums to publish opinions on the topic. The most frequently used social media sites include Twitter and Facebook, which account for nearly half of the Medicare-related conversations on social media.

Currently, a wide range of Medicare interest groups are active on social media outlets. AARP, a nonprofit organization for the elderly, has been active in the ACA and Medicare debates and offers interactive features on its Web site, including a donut hole calculator. Its earnedasay.org Web site is a one-stop resource where the public can voice their opinions through questionnaires and discussion boards and see arguments for and against changes considered for Medicare. With interactive features such as fact maps, videos, and links to state-specific information on Medicare, the site gives a voice in Medicare's future to the elderly group who are relatively new to the social media world.

It is projected that Medicare beneficiaries are more likely than ever before to take an active role in their health care, and are using social media as tools for empowerment and engagement. A Pew research report indicated that 32 percent of the Medicare population turned to social media for health care purposes in 2011. Seniors are often engaged with social media to search for advice on Medicare and share their experiences. According to the KBM Group's report on Medicare consumers, prescription coverage (Part D) and Medicare Advantage (Part C) are the most

Secretary of the U.S. Department of Health and Human Services Kathleen Sebelius personally greeting senior citizens in Washington, D.C., during an information session on Medicare coverage and open enrollment in November 2010.

prevalent topics discussed among seniors on social media sites.

To comply with President Obama's open government initiative, which focuses on implementing the principles of transparency, participation, and collaboration, many federal agencies started leveraging social media tools. The Centers for Medicare and Medicaid Services also adopted various forms of social media platforms including their official Web site (<http://www.medicare.gov/>), blog (<http://blog.medicare.gov/>), official YouTube page (<http://www.youtube.com/user/cmshhsgov>), and official Twitter account (<https://twitter.com/CMSGov>).

Private organizations are also responding to the trend of being present and accessible on social media. The UnitedHealthCare group launched a blog, as well as official Facebook, YouTube, and

Twitter accounts, offering features such as educational workshops. However, these social media activities mostly rely on a one-way and top-down communication style, and may fall short of facilitating public participation and social interactions. For instance, the official Medicare blog site currently does not allow users to comment on posts. The official UnitedHealthCare group's Medicare Facebook does not allow Facebook users to create original posts, and when users respond to a post, they usually do not receive comments from the page.

Conclusion

Social media have the potential for facilitating civic engagement, thanks to their collaborative and participatory nature. If social interaction is limited or nonexistent, the potential cannot become a reality. Social media are not merely marketing or educational tools anymore; they are evolving into social interaction tools that encompass a range of services. As stated by Ann Sherry, senior director of Kaiser Permanente's Internet services, people "want and need different tools and different interactions. To say we are going to have a social media strategy would not be enough—it's much more than media, it's a social strategy."

Meetup.com

Meetup.com provides an opportunity to find and join local groups of people who are interested in meeting to discuss common interests. A meetup is a group of people that come together in the physical, rather than the virtual environment to socialize around a common interest. Meetup.com is a for-profit Internet company launched in summer 2002 to enable users to find others nearby who want to meet monthly about any one of a myriad of potential common interests. Meetup.com does not decide what the list of potential topics will be, and is willing to add any meeting topic that is not pornographic, hate-based, or promoting illegal activity. Users enter their ZIP code or their city and the topic they want to meet about, and the Web site helps them arrange a place and time to meet. Topic listings are also available for users who only enter a location.

Background

The idea for Meetup.com has an interesting history, and came about in the months following the terrorist attacks of September 11, 2001. Scott Heiferman, cofounder of Meetup.com, lived a few miles away from the World Trade Center in New York at the time, and he noticed a change in the people around him in the months after 9/11. He found himself talking to neighbors and people around the city more than ever before. Prior to this, he did not place a high value on face-to-face interaction, because he felt the Internet provided enough opportunity for interaction through information sharing and communication. He noticed an important change in the feeling of the city, and thought this terrible event, 9/11, could be the catalyst for bringing people together. Heiferman was also motivated to start Meetup.com after reading Robert Putnam's *Bowling Alone*, since he thought he had a technological answer for how to use the Internet to build more social capital. The Web site was launched a few months later. The stated mission of Meetup is to "revitalize local community and help people around the world self organize."

Influence

Meetup boasted 13.4 million members in April 2013, organized into 105,000 groups in 45,000 cities around the world. On Meetup.com, anyone

can search for 19 local meetups around all kinds of interests, including outdoor activities, games, languages, animals, and technology. Meetups take place in thousands of cities at bookstores, cafés, restaurants, pubs, and other settings. To ensure the privacy of participants, Meetup gathers no data about individuals' demographics, and Meetup managers do not actually know precisely who attends what meetups.

Meetup can be said to be important in two dimensions: first, through the meetups themselves, participants might expand their social networks, sometimes in ways that cut across race, class and local geography; second, either directly or indirectly, it is possible that through the meetups, participants may take collective action or increase their political power by aggregating their interests.

An early use of Meetup in political campaigns was in the 2004 presidential primary campaign of Democrat Howard Dean. However, meetups were not envisioned as political. As founder Heiferman commented, "We never thought it would be used for politics. We figured that we would attract *Lord of the Rings* geeks and poodle owners." Some speculated that political Meetups would not continue after the ill-fated Dean campaign ended, but the number of meetups has continued to grow, albeit unevenly. Political meetups accounted for less than 15 percent of all meetups by February 2005, but Heiferman claims that the Tea Party was born on the site.

Out of the 2012 presidential candidates, only Ron Paul inspired a great number of meetups. Three things seem especially interesting about political meetups: these meetups tend to be left-leaning, political meetups tend to be dissimilar to other meetups, and meetups are not as candidate-specific as may be expected.

Membership Communications Project

David Karpf developed the Membership Communications Project (MCP) to provide the research community with an open data resource useful for understanding how advocacy groups utilize e-mail in communicating with their memberships. Karpf, currently an assistant professor in the School of Media and Public Affairs at the George Washington University, created the MCP dataset in 2010, when he was a postdoctoral research associate at Brown University’s Taubman Center for Public Policy and American Institutions.

While working on his doctoral dissertation at the University of Pennsylvania in 2009, Karpf noted that despite the centrality of e-mail communication to the work of advocacy groups, there was little systematic analysis in the research literature of how such groups employ the medium. Karpf also discovered that, although advocacy professionals had cultivated a set of best practices in the areas of list building, e-mail fundraising, and online-to-offline engagement, academic researchers were not focused on any of these

mundane mobilization tools, but instead were concentrated on emerging technologies utilized in mobilization efforts such as blogs, YouTube, and social networking sites.

Karpf also realized that the only extant empirical analysis of e-mail communication related to activist groups, namely Stuart Schulman’s “The Case Against Mass E-Mails,” published in *Policy and Internet* in 2009, was in fact a dismissal of e-mobilization via e-mail. Schulman reviewed hundreds of thousands of comments submitted by MoveOn.org in federal agency rulemaking processes related to environmental issues, and evaluated the comments gathered by this activist group from the general public as mostly redundant and overwhelmingly insubstantial. Based on this data, Schulman asserted that mass e-mail campaigns to collect public remarks for influencing decision makers constituted a clicktivism that by soliciting quick online activity was killing traditional activism grounded in collective action.

Based on his experience as national campaign director for the Sierra Student Coalition (the student-run arm of the Sierra Club) at the end of the 1990s, Karpf agreed with Schulman’s assessment that comments collected by advocacy groups were high-volume and low-quality, but disagreed with Schulman’s statement that such comments had negative consequences for citizen engagement. Karpf had two arguments for rebutting Schulman’s theory: He viewed e-comments gathered by groups like MoveOn.org in recent years as different in degree, but not in kind, from photocopied and faxed petitions and postcards collected by groups like the Sierra Student Coalition several decades ago; and he considered a high-volume and low-quality action (either offline or online) as a single tactic in the strategic repertoire of advocacy groups, rather than an entire campaign organized by any advocacy group.

Karpf’s research was aimed both at shifting scholarly attention from technologies for mobilization to tools of e-mobilization, and at providing empirical evidence for his counterarguments to Schulman. Karpf’s doctoral dissertation, titled “Unexpected Transformations: The Internet’s Effect on Political Associations in American Politics,” was a qualitative study of advocacy groups’ usage of e-mail as part of their campaigns, providing an initial set of evidence and an initial

analysis. However, during his postdoctoral studies, Karpf decided to pursue a quantitative test of his previous qualitative observations, and as such he started the data aggregation project that has come to be known as the Membership Communications Project.

On January 21, 2010, Karpf created an e-mail account via Gmail. He also identified a network of 70 prominent leftwing advocacy organizations, visited their Web sites, and signed up for e-mail lists or outreach efforts provided through those sites. This was meant to answer the question: “What do groups actually ask their online supporters to do?” For the first two weeks of data collection, Karpf used a broad descriptive classification scheme, then refined it to a set of categories based on commonalities between e-mails. The coding scheme resulting from this process included: date, organization, topic, digest/commentary/e-newsletter, action ask, fundraising ask, request for member input, and media agenda link.

Karpf encountered three hurdles in designing the dataset: identification of an appropriate sample of advocacy groups; deciding what to do about conservative groups; and accounting for limitations created by proprietary data. Because he was interested in organizations seeking to mobilize public pressure to affect policy decisions out of concern for the public good, Karpf understood that sampling from directories of Washington lobbying organizations and political action committees would not help because these represented businesses and other private interests.

To create a relevant sample, Karpf included 49 groups from a list provided by Elizabeth Payne, former director of the Democracy Alliance, in her book *The Practical Progressive*, and 21 groups of well-known members of the political left, human rights groups, and environmental organizations. However, when making the selection, Karpf left out advocacy groups representing the political right because he found these to have little connection with human and environmental advocates, and to have vertical rather than horizontal structures. Critics of Karpf’s work have suggested that this is a significant oversight. Additionally, when collecting the data, Karpf remained aware that such a dataset could not offer an exhaustive list of e-mail communication

between organizations and their membership, because organizations segment their lists in various ways.

The first dataset of the Membership Communications Project was collected during the six months from January to July 2010, and is composed of 2,161 e-mails sent by 70 advocacy organizations. This first dataset was utilized by Karpf as evidence for his article “Online Political Mobilization from the Advocacy Group’s Perspective: Looking Beyond Clicktivism,” published in *Policy and Internet* in 2010, as well as for his book *The MoveOn Effect: The Unexpected Transformation of American Political Advocacy*, published by Oxford University Press in 2012.

Meanwhile, the Membership Communications Project has become an ongoing effort that gathers mass membership e-mails sent by the selected organizations. As Karpf stated in the article “Social Science Research Methods in Internet Time,” published in *Information, Communication, and Society* in 2012, the project provides valuable data not only to its creator, but also to scholars who want to know how advocacy groups mobilized around Obama’s Health Care Reform bill or reacted to the Gulf Oil Spill. Such data was public because it arrived on a daily basis in tens of millions of inboxes around the world, but would have disappeared from the Web, had it not been saved in this dataset.

Meme Mapping

In 1976, Richard Dawkins proposed that the term *meme* be used to describe pieces of information or elements of a culture that travel through networks in different forms. Online memes, like lyrics from a popular song, behaviors, pranks, or part of a popular dance, travel through human and online networks via online videos, static images with words, sequences of animated GIFs displaying the lyrics, or videos that use the lyrics. Memes also include slight changes to the tune, tone, dance, and style to convey new meanings as the spread of the original meme increases over time. Memes are also frequently created by users to express their reactions to political campaigns, party platforms, candidate impressions, and some memes "go viral," spreading to larger online user communities.

Memes travel like viruses, spreading and changing as online users adapt and display them on a number of social media sites. When memes are uploaded to the Internet, users can share and forward the memes to one another, further propagating the cultural idea within the image, audio, text, or video. John Paull outlined meme mapping as a process whereby the origins and spread of a meme might be traced in order to understand how the cultural elements move through different communities and change over time. Paull describes his process as one that aids researchers in the ability to trace not only the spread of the meme through the Internet, but also aids in the identification of the events that may have led up to the birth of the

President Barack Obama joins in on a meme in this November 15, 2012, photograph at the White House with U.S. Olympic gymnast McKayla Maroney as they both make her "not impressed" facial expression, which went viral during the 2012 Olympics.

meme. This process is also useful for understanding how some memes travel through different cultures or regions more readily than others. For example, during the 2012 U.S. Republican Party convention, Hollywood movie star Clint Eastwood enacted a scene involving a conversation with an empty chair. During the television broadcast of the event, the term *Eastwooding* began circulating on social media sites like Twitter, Reddit, and Facebook. Eastwooding, a meme that came to be understood as speaking or scolding an empty chair, quickly became viral.

In order to trace the spread of a meme to create a meme map and understand the development of the example above, the point of origin would first be entered into any computer program or online tool that creates graphic, visual displays of plot pointed information. Researchers search online for the meme using several keywords or search terms related to the meme in order to trace the

popularity of the trend over time. For example, several online programs can be used to enter multiple search terms in order to trace the terms' popularity based upon regional locations and time ranges. This information can be used to plot points on the visual meme map to display the origin of the specific meme, its spread over time, and any spikes in popularity during particular dates or times. This information also can be used to display the particular sites through which the meme traveled and provide insights into the particular cultural element's spread through specific online communities or regions.

While it may not be possible to trace the entire spread of a meme through the Internet, it is feasible to trace how the meme travels and changes over time in order to gain a broader understanding of the reach of the element and popularity of spread through particular platforms. In the example above, similar to the structure of a virus, the base element of a person speaking to an empty chair was shared, and users then created pictures of themselves scolding chairs, fake Twitter accounts for the chair, live streaming events of empty chairs, built toy representations of the event, and other visual representations of this unique cultural element. These are just a few examples of how one cultural element circulates online and changes through subsequent user interactions.

Meme mapping enables researchers to trace such changes, and provides a broader understanding of how cultures share information with one another and between cultures. The visualization of the spread of the cultural element, traced through a meme map, provides a visually dynamic way to understand a meme's growth over time and the popularity of particular meme variants.

Menendez, Robert

Robert "Bob" Menendez is the junior U.S. Senator from New Jersey. A Democrat, he entered the Senate by gubernatorial appointment in January 2006 to complete the term of Jon Corzine, who had resigned with one year of his term unfinished. In the general election of November 2006 Menendez won a full six-year term. In 2012, he was re-elected.

Menendez was born on January 1, 1954, in New York City. His father Mario Menendez was a carpenter, and his mother Evangelina was a seamstress. His parents had left Cuba in 1953, just a few months before his birth. The family eventually moved to Union City, New Jersey, where he grew up. He was the student body president at Union Hill High School. After graduating from Union Hill, he entered Saint Peter's College in Jersey City. While in college, he joined Lambda Theta Phi Latin Fraternity. He graduated with a bachelor's degree in political science. In 1979 he was awarded a J.D. from Rutgers School of Law. In 1980, Menendez was admitted to the New Jersey Bar.

In 1973, Menendez led a petition drive against the Union City Mayor, William V. "Billy" Musto (1917–2006). Menendez was still a student at Saint Peter's College and just 19 years old; however, his petition drive was successful. The petition's goal was the reform of the Union City board of education. Even though he had opposed Mayor Musto, this did not end their mentoring relationship because Menendez served as a mayor's aide. Menendez married Jane Jacobsen in 1976; she was a teacher with the Union City Board of Education. They had two children, but divorced in 2005.

Political Career

In 1978, Menendez supported Mayor Musto when he ran for re-election to the New Jersey Senate. In 1982, he unsuccessfully ran against Mayor Musto, who was such a popular politician that on the day he was sentenced to federal

prison for racketeering, he was re-elected mayor. Musto had simultaneously been mayor of Union City and a New Jersey legislator. In New Jersey, election to the New Jersey General Assembly while holding another office such as mayor has been a common practice. In 1986, Menendez again ran against Musto for the office of mayor of Union City; this time, Menendez won. He served as mayor until 1992.

Menendez served in the New Jersey General Assembly from 1987 until 1991. In 1991, he was elected to the New Jersey Senate to fill the vacancy caused by the death of Christopher Jackson. He served until 1993, when he moved to the U.S. House of Representatives.

Congressman Frank Guarini of New Jersey's 14th District to the U.S. House of Representatives decided in 1992 to retire. In the realignment of districts following the 1990 census, the old 14th District was eliminated. Its territory was placed into a new 13th District. The reapportionment of the district changed its demographics into a majority Hispanic district.

In the Democratic Party primary in 1992, Menendez defeated Robert Haney, Jr. The vote was 68 percent for Menendez to Haney's 32 percent. In the November general election, he won 64 percent of the vote. In the subsequent elections in 1994, 1996, 1998, 2000, 2002, and 2004, he won re-election with 71 percent or more of the vote.

In 1995, Menendez had considered running for the U.S. Senate following the retirement of Senator Bill Bradley, a Democrat. He decided not to resign his seat in the House of Representatives, and instead supported the senatorial campaign of Robert Torricelli, also a Democrat. In 1999 Menendez again considered running for the office as a senator from New Jersey to the U.S. Senate. The occasion was the retirement of Senator Frank R. Lautenberg, also a Democrat. Again, he decided that the time was not right for making this race for office.

U.S. Senate

In January 2006, Menendez was appointed to the U.S. Senate by Jon Corzine, who was vacating the seat to become governor of New Jersey. The appointment was well received by a number of Latino groups. The appointment made

Menendez the sixth Hispanic to serve in the Senate. The appointment was to fill the remaining year of Corzine's unexpired term. The Senate seat was open for election for a full six years in the 2006 general election. In that contest, Menendez defeated Republican Thomas Kean, Jr. Kean was the minority whip in the New Jersey Senate. He was also the son of a former governor of New Jersey, Thomas Kean.

During the campaign, Menendez became embroiled in a controversy over a house that he had once owned and lived in with his family in the two stories above the ground floor where he had his law practice. This was the same arrangement used by a physician who was the previous owner of the house. When the family moved to another house, Menendez rented it to a nonprofit agency. Since the terms of the lease allowed Menendez to receive a percentage of the federal funding that was received by the North Hudson Community Action Corporation, there was the appearance of impropriety. A federal investigation began to see if he had improperly profited at taxpayer expense. While Menendez had profited, there was insufficient evidence of wrongdoing to bring charges.

Despite the controversy over the rental property, Menendez was helped in his campaign by the endorsement of the *New York Times*, the *Philadelphia Inquirer*, and other newspapers. The vote in the 2006 general election was 53 percent for Menendez and 45 percent for Kean.

2012 Election

In 2012, Menendez ran unopposed in the Democrat Party primary. However, the Republican primary was wide open. The Republicans fielded a large number of potential candidates including Diane Allen, New Jersey state senator; Chris Christie, governor of New Jersey; John Crowley, a biotech company executive; Michael Doherty, New Jersey state senator; Tim Smith, financial services executive; and Jay Webber, New Jersey state assemblyman. All declined to enter the race. This was despite speculation by the *New York Times* that Governor Christie, who was guiding a newly energized New Jersey Republican Party, could do well in the race because early polling suggested that Menendez could be vulnerable.

Ian Linker, a lawyer; and Anna Little, the former mayor of Highlands, New Jersey, both

withdrew from the race. David Brown, an inventor; Joseph Kryillos, a New Jersey state senator from the 13th District; Bader Qarmout, a businessman; and Joseph Rullo, also a businessman, all engaged in the primary process on the Republican Party side. The winner of the Republican primary was Joseph Kryillos. In the general election on November 6, 2012, Menendez defeated Republican Party opponent Joseph Kryillos and a small host of minor party candidates.

Social Media Use

During the 2012 campaign, Menendez engaged in three debates with the other candidates. The first debate was at Montclair State University. It was held on October 4, 2012, with only Menendez and Kryillos debating. The second debate was held on October 10, 2012, at the New Jersey 101.5 (WKXW) radio station at Ewing near Trenton. The third debate was on October 17, at Mercer County Community College.

While the debates were traditional forms of campaigning from which the minor party candidates had been excluded, Menendez also used social media for campaigning. His 2012 campaign Web site used both Facebook and Twitter. His site offered forms for those wishing to volunteer or for donors to use a credit card to give. The site was also available in Spanish.

Joseph Kryillos, Menendez's Republican opponent, used more social media than Menendez. Kryillos's site used Twitter, Facebook, RSS, and e-mail. His site allowed volunteering and donations. Over 8,000 donors contributed to his campaign, which was hurt by the disruption and destruction caused by Hurricane Sandy.

Some minor (third) party candidates also used social media. Libertarian Party candidate Kenneth R. Kaplan used social media links on his campaign site. Besides Facebook and Twitter, there were links to Google, Kaplan's biography on Wikipedia, and the Libertarian Party's Web site. Socialist Party candidate Gregory Pason used the same social media links of Facebook and Twitter on the Socialist Party site.

The Green Party candidate, Ken Wolski, used Facebook on his candidate's site. It also had links to RSS and other media. Gwen Diakos, candidate of the Jersey Strong Independents, used YouTube on her site.

Minor party candidate Daryl Mikell Brooks (Reform Nation) had a thin candidate's Web site without any obvious social media. The American First Party candidate, Inder "Andy" Soni, did not use social media, although he did post an advertisement on TeaPartyCheer.com.

Some independent candidates used social media; whereas others used it sparingly if at all. Totally Independent candidate J. David Dranikoff used a Twitter account for campaigning. He was featured on the news site njspotlight.com. Independent Eugene Martin Lavergne had a personal Facebook page, but did not seem to use any social media, other than also advertising on TeaPartyCheer.com, which costs \$500 per month. Robert "Turk" Turkavage established a campaign Web site. He allowed followers to post replies, follow him on Twitter and Facebook, and use RSS feeds.

Menendez was able to outstrip his opponents in fundraising by better than \$3 to their \$1. He had over \$10 million, compared to Kryillos's \$3 million. The minor party candidates had only a few thousand dollars at most. Menendez won a second term in the Senate, with 58.4 percent of the vote compared with Joseph Kryillos' 39.9 percent. The minor party candidates captured the remaining 2 percent of the vote.

The Senate Web page for Menendez uses Facebook and Twitter. It also has a "Press Kit" link that goes to a "share" link with hundreds of social media and other links available.

Menendez is on three Senate standing committees. The Banking, Housing and Urban Affairs Committee does not use social media, nor does the Subcommittee on Housing, Transportation, and Community Development, of which he is the chairman. He also serves as a member of three subcommittees of the Senate Finance Committee, which also does not use social media on its page. The Senate Foreign Relations Committee has four subcommittees on which Menendez serves. This committee also does not use social media, nor do any of the subcommittees on which Menendez serves.

Menendez belongs to several Senate caucuses. The Congressional Armenian Caucus does not have a Web site, but is discussed in a number of online sites. The Congressional Autism Caucus site is run by Mike Doyle (D-PA). It uses social media—Facebook, Twitter, YouTube, and RSS

Feeds. The International Conservation Caucus uses Flickr, Twitter, YouTube, RSS feeds, and Facebook. The Human Rights Caucus is now called the Tom Lantos Human Rights Commission. It has been renamed in honor of the late Congressman (D-CA) Thomas Peter “Tom” Lantos (1928–2008) and uses Flickr, Twitter, YouTube, RSS feeds, and Facebook. The Senate Caucus on International Narcotics Control does not use social media, but does have a Skype link.

Microblogging

Microblogging is one of the most popular Web 2.0 applications, and is a relatively new phenomenon in online social networks. It is often used as a broadcast medium in the form of blogging, whereby users describe their current status in short posts distributed by instant messages, mobile phones, e-mail, or the Web. Microblogging allows users to write brief text updates (usually less than 140 characters) and send them to their friends and

other interested observers. It also allows users to exchange small elements of content, such as individual images and video links, and these small messages are also sometimes called microposts.

A microblog differs from a traditional blog in that its content is often smaller in both actual and aggregate file size, and provides a lightweight easy form of communication that allows users to broadcast and share information about their activities, opinions, and status. It is therefore considered a miniature version of the regular blog. In addition, compared to traditional blogging, microblogging fulfills the need for a faster mode of communication. By encouraging shorter posts, microblogging reduces users' requirement of time investment for content generation. Another difference concerns the frequency of updates among microbloggers. While on average, prolific bloggers may update their blogs once every few days, some microbloggers post several updates a day.

One of the most popular microblogging tools is Twitter. Since its launch in October 2006, it has experienced significant growth around the world. Within eight months of its launch, Twitter had about 94,000 users, and users of Twitter can publish short messages, or “tweets,” which are visible on a public message board of the Web site. While tweets are usually directed toward a general audience, if users want to direct a tweet to another user or send it as a response to an earlier tweet, they may add the “@” symbol to the intended user's name. “RT,” or “retweet,” means that a previous tweet is being sent again by a user. Topics of these tweets range from daily life to current events, news stories, and political opinions.

Because of its popularity, microblogging has revolutionized the ways in which information is delivered, circulated, and consumed around the world. It has also empowered citizens to act as sensors or sources of data, which could eventually become important pieces of information. Since many people are keen on sharing information about events and their opinions about certain topics, including government policies and political issues, microblogs have become an increasingly important source of information.

While the original idea behind microblogging was to provide personal status updates online, microblogging has had an important impact on the political scene in the United States. In

particular, it has been widely used for political deliberation, and such deliberation is often seen as reflecting the political landscape of the offline world. For example, many politicians make use of microblogging to communicate with the electorate and mobilize their supporters. Some politicians use Twitter as a vehicle to promote their political agenda, tweeting about economics and providing general information to their people. In addition, some politicians use Twitter to enhance their popularity, exposing the public to information about their meetings, speeches, interviews, pictures, and videos. One reason for the popular use of microblogging among politicians is that it provides a channel that is not filtered by local or national media, so that they are able to convey their political agendas without censorship or filtration.

One prominent example of the use of microblogging in the political arena was the U.S. presidential elections in 2008. Both presidential candidates, John Edwards and Barack Obama, integrated microblogging into their campaigns for the Democratic Party presidential primaries in 2008. Both of them used different platforms of microblogging to reach voters and other stakeholders, and to keep their Twitter followers abreast of upcoming appearances. In particular, the successful use of microblogging in the U.S. presidential campaign of Barack Obama has established Twitter, Facebook, Myspace, and other social media as integral parts of the political campaign toolbox. It also suggests that microblogging provides new opportunities for online campaigning and electorate engagement, thereby showing the importance of microblogging as a key tool for public relations in organizing the election campaign and political marketing. Some researchers even attribute Obama's victory to a large extent to his online strategy. Obama's social-networking Web site helped him set records in terms of donations and grassroots mobilization. Shortly after his successful election as president of the United States, Obama used Twitter to let the Web community know how he felt: "This is history." As a result of the 2008 campaign, Twitter has become a powerful and legitimate communication channel in the political arena.

There have also been some studies on political Twitter use that focus on parliamentary uses

of the service. A recent study found that parliamentary members tweeted primarily to disseminate information, often providing URLs to news articles about themselves or to their blog posts. Congresspeople also reported on their daily activities on Twitter. While these updates did not provide insights into the political process or improve transparency, some of the tweets can be seen as vehicles for self-promotion and for expressing their opinions concerning various political and social topics, indicating a mode of use that is aimed at one-way, top-down communication, rather than actually engaging with the citizenry. In other words, while microblogging in general has evolved toward becoming more conversational and collaborative, such use was rather limited among parliamentary members.

Moreover, microblogging is an important predictor of online political participation. For example, in a recent study, researchers found that microblogging provides alternatives to mainstream media outlets to influence public opinion about politics. It has also been claimed that Twitter is a valid real-time indicator of political sentiment.

Another recent study revealed that Twitter has been exploited as a powerful platform for political deliberation. For example, it was found that the number of tweets reflects voter preferences and comes close to traditional election polls; and the sentiment of Twitter messages closely corresponds to the political programs, candidate profiles, and other reports from the media coverage of the campaign. However, while some researchers view the "Twittersphere" as an indicator of political opinion, others have suggested that the majority of the messages on Twitter are instead pointless babble.

Microfinance Initiatives

The creation and circulation of community-based monetary and credit relations is the essence of any financial transaction, either in a local neighborhood or in the international community of nations. In other words, all exchanges and pricing practices exist only insofar as confidence in a specific representation of value is shared by a community through iconic objects such as coins, notes, badges, and other expressions of worthiness. Microfinancing can play an important role in bringing new media technologies to traditionally undercapitalized populations, especially in international environments where social media communications, in particular, can affect the kind and level of political participation those populations can enjoy.

Overview

Local, community, peer-to-peer, or neighborhood-based financial exchanges are older than money and may be a permanent, underlying force in any transaction, market, and financial system. Fiduciary money is an expression of *fiducia*, a Latin word for trust and the root of the word *confidence*. In order to express and enhance the fiduciary essence of any currency, coins have always been minted with images of kings and queens, so that protection of the kingdom's money equals respect for the sovereign. In local and community currencies and credit systems, other icons are often socially selected in order to make the underlying social confidence visible to the traders. In other words, every currency is an economic expression of social communication. Money is (social) media.

Microfinance initiatives, however, are not necessarily founded and funded by locals because global multilateral institutions such as the World Bank and the Inter-American Development Bank have been supportive of national policies to enhance access to financial services or "bancarization" of poor or underserved communities. In short, complementary or alternative currency systems may result from bottom-up, autonomous community projects, or from policy-led, governmental and multilateral institutional build-up supported by private and public banking systems. The World Bank estimates that 160 million people in developing countries are served by microfinance.

Both local and global initiatives favoring microfinance share an underlying perspective that favors social fund and community-driven development projects. These initiatives are not necessarily pro bono or not-for-profit and oftentimes microfinance initiatives are seen as the "exit door" for low-income, low-revenue entrepreneurs to scale up into small and medium projects and enterprises. Social businesses are also part of microfinance toolkits that start with grants for individual or family income-generating activities in emergency or post-conflict situations.

Microfinance provides basic financial services, such as credit and deposit-taking, on a very small scale, to historically marginalized populations that do not meet the criteria to do business with conventional banking institutions. This covers people who do not qualify for credit because of their lack of access to collateral.

According to the United Nation's (UN's) Capital Development Fund, microfinance helps very poor households meet basic needs and protect against risks, while the use of financial services by low-income households is associated with improvements in household economic welfare and enterprise stability or growth. Moreover, by supporting women's economic participation, microfinance helps to empower women, thus promoting gender equity and improving household wellbeing.

Microfinance and Microcredit

Microfinance is associated with long-term projects, whereas microcredit is usually a short-term operation. The long-term return of microfinance initiatives is associated with the power to generate

economic returns while improving grassroots political and social involvement.

However, grants and social transfers are not seen by multilateral institutions as a sustainable mechanism for the economic development of a community, while individual and family-owned businesses that are privately financed are seen as more prone to success. Local initiatives are led by microfinance institutions (MFIs), such as financial cooperative/credit union networks that are interested in broadening their outreach to geographically underserved areas and in deepening their outreach to the poor.

Community-based, bottom-up initiatives are favored when commercial banks are not present, and may start building informal or semi-formal community financial institutions that may gradually link to the formal financial sector, either directly or through the creation of federations. The microfinance toolkit goes beyond micro-credit to include savings, insurance, payment services, and most critically, technical assistance given the low literacy of poor and underserved communities.

Initiatives and Community Dynamics

The creation of social, local, or community currencies (also known as complementary currencies) also constitute the base for bottom-up microfinance initiatives. As a matter of fact, people have always traded or bartered with each other, using different tools and materials to represent and store value in various kinds of transactions, including trade, investment, consumption, production, marriage, kinship, and sacrifice.

In complex urban and global capitalist societies, money expands the potential for growth and accumulation while creating new forms of wealth and power concentration, regulated by central banks, which are more responsive to the interests of private, commercial banks as well as multilateral organizations. Microfinance initiatives anchored in community or complementary currencies offer an alternative solution for local markets deprived or unserved by global or national currencies. During financial crises such as with the euro or the Argentinean peso, these initiatives have been the only way out of total unemployment and the lack of social services in local communities.

Theoretical and empirical studies have demonstrated that a greater “depth of the financial markets” (the ratio of key financial aggregates such as credit or bank deposits to gross domestic product) enhances economic growth potential. These findings have resulted in policy recommendations that target “access to financial services,” defined as the percentage of the population that can freely use financial services, and the reduction of poverty and inequality. On the other hand, the fragility of underserved communities is also a major source of difficulties with respect to data collection and analysis, so that empirical studies about access do not give conclusive results with respect to the causes and consequences of low access to financial services.

Another important area for microfinance initiatives has been associated with the global flow of migrant workers. The issue of remittances and the vital role that they play in the lives of migrant populations has been of particular interest to policymakers both in national and multilateral spheres. Private transfers from migrant workers who are considered residents of the host country to recipients in the workers’ country of origin have been targeted as yet another frontier for bancarization and microfinance. In this perspective, policymakers are mostly concerned with fiscal policy issues—worldwide remittance flows are estimated to have exceeded \$440 billion in 2010, of which developing countries received \$325 billion. New digital media and interfaces such as mobile phones in Africa have become a major tool for remittances because prepaid phone credits have become an informal framework for transfers.

Empirical research has consistently produced evidence that shared codes, religious beliefs, and ethnicity—in short, cultural proximity and communication patterns—between lenders and borrowers improves the efficiency of credit allocation. In other words, microfinance initiatives are very close to social media dynamics as long as the depth of financial services is associated to cultural commonalities. Religion and caste of bank officers and borrowers in India induces financial matching between officers and borrowers. Cultural proximity increases lending and improves repayment performance. Further, cultural proximity increases loan dispersion and reduces loan to collateral ratios. Cultural proximity mitigates

informational problems that adversely affect lending, which in turn relaxes financial constraints and improves access to finance.

However, the effect on financial efficiency of cultural proximity between transacting parties is ambiguous. While members of a group tend to do business with one another, this may lead to discrimination or favoritism, thus resulting in the misallocation of resources. Alternatively, if cultural proximity reduces the cost of communication or contract enforcement, in-group transactions may be more efficient. The relationship between communication and cultural proximity on financial efficiency remains an empirical question.

Gender

Last, but not least, gender issues have proven to be a major source of inspiration for microfinance initiatives. Poor women in particular benefit from microfinance services. Women's status, both in

their homes and in their communities, is elevated when they are responsible for managing loans and savings. The ability to generate and control their income can further empower poor women. Research shows that credit extended to women has a significant impact on their families' quality of life, especially their children, while women's commitment to repayment is outstanding, so they tend to have the best credit ratings. In Bangladesh, for example, women have shown to default on loans far less often than men.

History

The history of microfinance initiatives dates back to 1959, when Akhtar Hameed Khan launched microcredit for a rural development initiative that evolved into the Bangladesh Academy for Rural Development (BRAC), one of the first microfinance institutions. He began lending small sums to entrepreneurs in the slums of Pakistan, and established one of the earliest models for microlending.

In 1973, ACCION International, a volunteer organization providing infrastructure services to the poor, initiated a new program in Brazil, where it began making small loans to the poor for income-generating businesses, instead of offering free services. The loans allowed people to establish self-sustaining businesses that helped stabilize their financial status and lift them out of the cycle of poverty.

The potential of the poor as economically active agents is at the origin of the microfinance philosophical framework as promoted by Mohammed Yunus, founder of Grameen Bank and Nobel Peace Prize winner in 2006. In 1976, during visits to the poor households in the village of Jobra near Chittagong University, Yunus realized that very small loans could make a disproportionate difference to a poor person after lending \$27 from his own pocket to 42 women who made bamboo furniture. They made a net profit of \$0.02 each on the loan. Thus, he came to the conclusion that their use of very limited resources was extremely effective. The challenge was to translate poor people's economic activism into an entrepreneurial spirit. Based on his observation that the poor (especially women) are hardworking and industrious, Yunus became an icon of policies that take the poor not as

A Filipina woman using a mobile phone in 2012 to access banking services for a USAID microenterprise program that offered loans to small business owners in the Philippines.

“unbankable,” but only overlooked by conventional banking institutions because they lacked material collateral.

Conclusion

Microfinance initiatives result from the adoption of core principles for alternative banking and social inclusion. There must be a commitment to end capital starvation, rather than rely on charity or grants. The main goal is to promote access to and use of banking and financial services by all through new technologies and distribution channels to capitalize assets among the poor, usually stressing cultural or gender-related dimensions of social organization.

While microfinance is keen on alternative banking, it seeks to work within regulations, guidelines, and best practices recommended by domestic monetary authorities and international regulatory institutions such as the Bank for International Settlements, Basel II Capital Risk Guidelines, the World Bank, and the Inter-American Development Bank. Bancarization also wishes to integrate corporate social responsibility into down-market business strategies and institutions of representation and democratization. The promotion of financial education to encourage responsible banking and finance and avert predatory lending and unethical practices is also part of the microfinance ethos, which has proven to be open to a diversity of local development models for the benefit of either bottom-up or universal top-down financial inclusion policies.

Microtargeting

Political parties and election campaigns have begun utilizing datamining techniques previously honed by direct marketing experts to segment potential voters based on a myriad of factors. After using market information to determine political leaning and likelihood of voting, the parties use various campaign techniques (including direct mail, phone calls, television ads, radio ads, Internet advertising, and e-mails) to deliver personally crafted messages intended to speak to them as directly as possible. The key tactic is to tailor the message to particular subgroups in order to best activate them to support a particular party or candidate and to vote. For example, at the most basic level, if an individual is a National Rifle Association member, ads will be targeted to gun issues because the market research suggests that this issue is of importance to that voter.

While political campaigns have long borrowed ideas and strategies from private sector marketing, microtargeting has been one of the most important developments for strategists since it first garnered national attention during the 2004 election cycle. Without large, sophisticated databases, however, microtargeting would not be possible. In a similar way to how credit card companies or grocery stores track spending habits, voter databases contain information about the voter (like party identification, voting turnout, campaign contributions, and volunteerism), along with other activities purchased from vendors such as Acxiom and Experian Americas. Democrats rely on a database called VoteBuilder,

while Republicans use Voter Vault. Aristotle is the leading nonpartisan database company.

Once purchased, the databases are mined to identify what issues are likely to matter to which voters, along with likelihood of party affiliation and turnout. After combining political and consumer information, voters are grouped together based on their preferences and assigned labels (such as “Soccer Moms”).

Computer modeling is used to assure that preconceived notions of campaign workers do not sway group classifications. Once the groups are established, tailored messages can be created and then sent through varying means—assuring that voters receive information that seems like it was customized especially to them. No longer are single ads created and spread to all individuals. This was a wasteful approach given that the ad could equally dissuade some voters as it persuaded others, based on the subject and the beliefs of individual voters. Now, there may be dozens of variations of each, with certain segments or aspects highlighted in order to reach a targeted group of voters.

In this way, microtargeting allows campaigns to put a specific message in front of a specific voter. As increasingly more data has become available, the level of microtargeting has become more sophisticated. The process for microtargeting has also become easier, with continued developments in the Internet and social media. First, a cookie is placed on a user’s computer after visiting a Web site. Next, the profile is matched with offline data that is available (like type of car driven, credit cards used, or typical purchases made). Then, political consultants match this data with voting records that are publicly available, including party registration and when they have voted or not voted. Voters are tagged with codes to guarantee anonymity as best as possible, but the effect is typically the same. Instead of simply buying an ad and hoping that the targeted group stumbles upon it, campaigns can buy the audience and then present the ad.

In 2009, Chris Christie ran for governor of New Jersey. Governor Jon Corzine accused Christie throughout the campaign of supporting cuts in health care coverage, including mammograms. By working with a targeting strategist, Christie was able to create a video showing him

and his wife talking about his mother’s struggle with breast cancer. It ends with him attacking Corzine for trying to scare voters. The ad was aimed at Republican voters searching for information on breast cancer, and attempted to assure them that Corzine’s attacks were not correct.

Social media has made the ability to microtarget even easier. Campaigns can pull information from a person’s Facebook profile (or even those of their friends) to determine what messages are most likely to appeal. They can similarly analyze someone’s tweets and create hyperspecific messages. Social media is largely held as responsible for the increase in distinct bits of data available on each voter. In 2004, there were approximately 300 such pieces available on average, whereas today there are more than 900.

Despite microtargeting’s popularity with campaigns, the American public does not seem to be as thrilled with its existence. In a 2009 survey, 86 percent of Americans indicated that such collections of data are an invasion of privacy, and that they would prefer it to stop. Given the success campaigns have experienced with the tool, however, microtargeting is likely to continue.

Middle East

Across the Middle East, north Africa, and Persian/Arabian Gulf, beginning in the late 1990s, and in particular over the last several years, military personnel, researchers, civil society members, and governments alike have moved their networking online. In doing so, they have followed in the footsteps of the early adopters of offline precursor BitNet and GulfNet e-mail systems in use in the 1980s for private, personal, or closed data exchanges among limited members of military and research communities.

Over the years, governments moved online, largely in an effort to inform and typically speak at (rather than engage with) their subjects and/or citizens, thereby cosmetically replicating transparent two-way communication mechanisms normatively considered essential for democratization and healthy governance by international organizations. Civil society members, on the other hand, moved online as part and parcel of wider cultural expression practices they previously channeled through older media technologies like audiocassettes or performance. This trend has largely been led by young people, with the aim of airing grievances from varying political vantage points and bringing about change to the military, political, economic, and social structures in place. In their case, young people moved to these channels because public space was and remains circumscribed across much of these regions, and older and/or more mainstream media remain largely controlled and/or co-opted. Thus, young people have taken the lead as early adopters of newer social media services to express, network, and organize.

Regionally, users access online social media via platforms like computers, tablets, and especially mobile phones, and offline via face-to-face exchange of mobile phone SIM cards. They access these platforms in stationary locations like homes, schools, and where neither is available to them, telecenters, or simply on the go. Today, regional Internet penetration rates have skyrocketed to 88 percent at their highest (in both Bahrain and Qatar), inching up to the current world leader at 96 percent (in Iceland), but start at just 5 percent (in Iraq), according to remaining International Telecommunication Union (ITU)

country-by-country indicators for 2012. Uses to which people in these regions are putting these services, including the forms and contents channeled through them, range drastically.

Across the Middle East, north Africa, and Gulf, governments and/or individual politicians have turned to social media predominantly to establish profile pages, open government sites, tweet about their policies, and/or create virtual states. With respect to government profile pages, these are ubiquitous, and even extend to include pages established by spouses and children of governing royal elites, aiming to provide mediated face-to-face exchanges with their respective populations. Illustrative are the sites of Jordanian Queen Rania Al Abdullah and Saudi Princess Basmah Bint Saud, respectively. Their official Web sites are in Arabic and include mirror sites in English for networking beyond the region, including through their “my Rania” and “contact [us]” pages, respectively. Where individual political parties or movements are concerned, online presence, however, varies drastically. In Egypt, the Muslim Brotherhood serves as an example notable for its large online presence, using sleek marketing techniques and designs to attract younger users like ikhwantube (paralleling YouTube).

Open government networking that goes beyond not just communicating at but with publics have been especially rare. One notable exception is the mygov.il site established by Israel in 2006. It includes portals in Hebrew, Arabic, and English, each targeted to different audiences in an effort to provide on-demand political, cultural, and business related-information. Second, and more notably, it enables citizens to set up an online account in order to engage in government transactions. Thus, for example, those seeking to renew driving licenses, order a phonebook or pay bills begin at, or are directed by the other two portals, to a Hebrew page to make their transactions. The unique choice by Israel to move governance online in this case naturally paralleled high online penetration rates by a majority of 73 percent of the population. Consequently, that rate is the fourth highest, following the United Arab Emirates (at 85 percent).

Finally, governments of non-state political institutions and/or non-self governing territories have, likewise, used social media, in their case, to establish virtual states in the absence of literal

or physically existing states. Examples of these include the Facebook page establishing the virtual Saharawi Arab Democratic Republic state, separate of Morocco, or its television station, operated by the Saharawi political leadership, the Polisario. A second example is the Palestinian National Authority and later updated, Palestine Ministry of Foreign Affairs portals, updated to reflect the UN vote recognizing the change from the observer status of Palestine to the observer status of the State of Palestine. The former portal notably and nevertheless, already operated under ownership of a cyber state domain name, namely, “ps.” Therefore, since its online origins, despite not literally controlling a state in “real” space, Palestine has nevertheless administered a state in cyberspace.

Popular users, mainly young people who represent not just the larger amount of people online today but the more diverse uses to which social media are being put, have been the most prolific where public exchange of data is concerned. In the last several years, they have both participated by responding to and commenting on social media forms and messages and themselves produced both, through news and entertainment forms. With respect to producing their own political expressions via the underground options social media afford, these span efforts that bear witness to events, cover underreported issues through citizen- and civil-journalism, engage with intergroup and foreign relations, to advocating and networking on behalf of state reforms or specific causes germane to women’s and underrepresented ethnopolitical minority and nationalist group rights, among others.

Alternative News Sources

Social media have been employed to document and serve as witness to protests (common during the Arab Spring) and acts of violence. With respect to witnessing violence, uses include filming and unvetted uploading of videos like those famously sneaked out of Libya during the Jasmine Revolution, as for example footage in February 2011 of soldiers purportedly murdered at leader Muammar Qaddafi’s orders for refusing to shoot at protesters. A second example includes documentation of acts of harassment and/or physical violence by Jewish-Israeli settlers

against Palestinians filmed by Palestinians, Israelis or international observers.

Notably, and controversially, such examples of non-vetted footage, while on the one hand, playing an incredibly vital role, cannot, on the other, necessarily be corroborated (whether according to the acts seen in the footage, or the causation attributed to them). Moreover, in some instances, they have been doctored, and yet in others, recycled from one conflict context or time period and claimed to have occurred in another. As a result, a controversy exists over whether such footage serves as a legitimate source for testimonial for counting of and reporting on human rights violations. For the sake of accuracy and objectivity, now more than ever, the speed at which these are produced and distributed, therefore, implore the need to scrutinize contents deeply and quickly and prior to press or posting.

A third example of using social media to document violence includes the writing of war blogs like *Bagdad Burning*, which Riverbend began in 2003. In the blog, the author chronicles everyday life as an Iraqi citizen and life in a war zone, including from a woman’s perspective. Written in English, she largely directs her blog toward an international audience (including to attract more than the only 7 percent of the Iraqi population that is online) out of the hopes of garnering intervention.

An example of citizen journalism is Mamfakinch. Its Twitter account is @Mamfakinch. Begun in 2011, it was created in connection with the youth-led February Twentieth activist movement’s efforts to spark reform in Morocco during the Arab Spring. The organization’s social media presence serves to provide alternative information largely unavailable in the Moroccan press in an effort to give voice to and advocate on behalf of underreported issues of reform and rights. A second example is FSN, the United Syrian News Network, also created in 2011, by Syrian youth whom, likewise were concerned with agendas and frames set by mainstream media sources. In their case, however, their viewpoint differed. They argued that the government, namely the perspective of the Bashar al-Assad regime, and to some extent, also the dominant ethnopolitical group’s narrative, the Alawi, have become marginalized. Therefore, they strive to report in a manner that provides the regime with a voice.

Like citizen journalists, professional journalists have turned to social media to establish civic journalism organizations. To that end, they have created blogs and/or made use of Twitter to provide more detail and/or opinion about the news that they cover. Typically, they do so independently of the organizations for which they work. Examples of the former include Palestinian Daoud Kuttab's online independent radio station managed by the Community Media Network in Jordan, Amman Net, and the Moroccan *Lakome* news Web site created by Aboubakr Jamaï. Examples of the latter include Twitter accounts by both journalists, as well as an extensive list of others like independent Lebanese journalist with *Now*, Hanin Ghadar, or those who are employed by global media organizations like the BBC, as in the case of previous Arab Affairs Analyst Magdi Abdelhadi in Egypt. A third use of social media, Twitter, provides journalists with a new tool for following leads; for example, Al-Jazeera's Ayman Mohyeldin did during his coverage of Jasmine Revolution events in Egypt.

Foreign and Domestic Policy

Apart from news purposes, social media are also popularly being used in the region for intergroup and/or foreign policy relations. To that end, users have made use of social media to engage in conflict as for example, during the so-called Twitter War that transpired in November 2012 between official Israeli and Palestinian Twitter accounts in the context of an escalation in literal conflict. During that time, Twitter was used in real time by the accounts owned by Israel's @IDF Spokesperson (as part of its military operation "Pillar of Defense" in Gaza) and Hamas's military wing's @Alqassam Brigade. Both used their accounts to threaten and announce incoming military strikes, and confirm hits, to the end result that their live-tweets entered the real theatre of war. Alongside those, per time and location-stamp data social media updates provide, a potential existed that data posted by members of the Israeli and Palestinian public could also be used to more "effectively" plan offline physical attacks.

In other cases, users have turned to social media to prevent conflict, as with the people-to-people "Israel Loves Iran" campaign. Begun by Israeli Ronny Edry in March 2012, he posted an online

Egyptian blogger and director of the Cairo office of the American Islamic Congress Dalia Ziada. The American Islamic Congress is a grassroots organization that works to encourage young people to advocate for civil liberties in the Middle East.

photograph of himself and his daughter with the headline, "Iranians, we love you. We will never bomb your country." Edry posted the image in an effort to bypass the state amid escalating tensions between Israel and Iran. At the time, concerned over the threat the continued development of the Iranian nuclear program could pose to Israel (if nuclear weapons were developed), and Israel's threat to preemptively bomb Iran's nuclear enrichment facilities, Prime Minister Benjamin Netanyahu and President Ahmadinejad pursued an escalating war of words. In response to Edry's posts, Iranians replied with their photographs, which they accompanied with headlines like, "We love you Israeli people." The campaign developed and today continues under, "Not ready to die in your war."

In other cases, social media have been popularly used to advocate on behalf of statewide reforms, and critique state leaders, governing apparatuses, and associated policies. In efforts expressing such critiques, there is a trend whereby users have moved from covertly protesting via a pseudonym to overtly doing so by using their names. An

example of the latter is the ongoing blogging by activist and North Africa Bureau Director of the American Islamic Congress Dalia Ziada. From the beginning, Ziada blogged using her name, advocating for change on the part of President Hosni Mubarak's regime. As part of her encouraging Egyptians to adopt nonviolent action methods, she garnered international attention after translating the story of American Martin Luther King, Jr.'s, nonviolent protest movement into Arabic in 2007.

Second to the above trend, there has also been a move from the use of social media to disseminate indirect to directly critical messages. Examples of the former can be found in lyrics to music on Facebook and YouTube like that shared by fans of the Egyptian singer, Hamza Namira. His song, "Dream With Me," officially released in January 2009, read as an allegory (or at least was attributed by fans as such). In the video for the song, the dreams of a boy coming of age are depicted, while Namira sang about tomorrow, explaining that "if it doesn't come . . . we will bring it ourselves." On the face of it, the song could therefore pass as addressing micro socioeconomic and human development-based growing concerns. His fans, however, read it as an allegory about the need for the Egyptian masses to rise up against Mubarak's state apparatus if the state did not reform itself.

On the opposite extreme, the sharing of overtly critical lyrics, is the song "President, the Homeland," sung by Tunisian rap artist El Général. In the song, El Général directly criticizes President Zine al-Abidine Ben Ali, addressing his words to "Mr. President" and referring to the state's leadership and Ben-Ali's wife's family, the Trabelsi elite, as "sons of bitches" who "steal in broad daylight, confiscate property, and own the land" and who have "robbed, dismembered, kidnapped and would not give up the seats [of power]." Continuing with his rhyme, he adds, "there is no one to tell them the word 'stop,' even the law that's in the constitution."

In an effort to bypass censorship, El Général clandestinely "published" this song on November 7, 2010, directly to Facebook. Thus, through the use of social media, he was able to disseminate the song and work to build a fan base and the associated discourse around his music's politically minded themes. As both these examples suggest, social media serve as important

services for more widely and efficiently disseminating politically themed music. This is important, given that (as historian Mark LeVine has written) music (in particular, rap and heavy metal), have played important roles in providing vehicles for the dissemination of expressions of popular protest across these regions.

Women, Ethnopolitical Minorities, Nationalist Group

In yet other examples, rights-based organizations across these regions are using social media to advocate on behalf of specific causes like gender-based rights. One example is Meydaan, with a Web site that partners Iranians in Iran with those living in exile and/or the diaspora to campaign on behalf of women's rights. A second example makes use of music to advocate on behalf of women. It involved fans sharing the song by the Palestinian-Israeli band DAM via YouTube, "If I Could Go Back in Time" featuring Arab/Palestinian-Israeli singer Amal Murkus. The song critiqued honor crime-based violence against Palestinian women. Parenthetically, the song itself was criticized as neocolonial, and moreover, if framed in regional statistics establishing that the majority of regional crimes against woman are, in fact, not honor based, also illustrated cultural stereotyping about existing gender crimes. Nevertheless, the song provides an important example of uses of social media for the discussion of gender issues, including limits set on women's rights and opportunities.

Other popular rights-based uses to which social media have been put in these regions extend to the sharing of forms advocating on behalf of an expansion of the rights of state minorities and/or nationalist groups seeking expanded rights, self autonomy, and/or statehood. One example is the circulation of the song "Born Here," also by the Palestinian-Israeli band DAM. The song, which garnered the band international fame and was widely circulated, voiced Palestinian-Israeli state minority and Palestinian nationalist grievances in pursuit of equality and independence.

A second and technologically noteworthy example in this category is the sharing by (once) seminomadic Tuareg diaspora of their nationalist-themed music by blending older with newer social networking tools. Spread across Mali, Algeria, Libya, Burkina Faso, and Niger, and historically

having migrated through and across each of these states, as Baz Lecocq has described, the Tuareg developed a hybrid musical genre known as al-Guitara. Al-Guitara blends Dire Straights and Hendrix-styled rock guitar with Tuareg, in particular Algerian cultural styles, into a form most famously associated with the Malian Tuareg band Tinariwen. Tinariwen's songs express Tuareg consternation with the presumed dichotomies and foreign policies of both Arabs and the West, and the feeling of displacement by the two, in particular in Mali. They expressed a desire to reunite and liberate themselves from both. Their music parallels the 2012 self-declared independence of the state of Azawad in northern Mali.

Importantly, such hybrid al-guitara music circulates via hand-delivered mobile-to-mobile phone SIM card exchanges. That is, via the combination of "old" face-to-face networking and data uploaded and stored to SIM cards, Tuareg musical protests are exchanged in and across vast stretches of the Sahara desert where Wi-Fi capability is unavailable. The result is that the construction and circulation of this musical style preserves, stores and archives Tuareg culture, and provides the soundtrack for their political protest. Most notably, it illustrates both a genre and form that is powerful enough to transcend the very erection of Saharan imposed state borders. That is, it has cut across state borders and politics to the end of having reconfigured the very meaning of the so-called MENA or Middle East and north African regions. As a result, it necessarily alters discussion of just what is meant by politics in the MENA and Gulf, thereby calling into question a need to include the borderlands region between North and sub-Saharan Africa, or the Saharan region into such discussions.

Lastly, two gamers partnered together to create the first ever Arab-themed browser-based massively multiplayer online game (MMOG). They did so, according to the two, to educate and engage in pan-Arab and global networking. The two gamers, Vince Ghossoub and Radwan Kasmiya, of Lebanese and Syrian heritage, respectively, and based in China, created the critically acclaimed MMOG, *Knights of Glory*. *Knights of Glory* serves to bring the online gaming community together to educate players about Arab history, and in particular Arab conquest of the Persian and Byzantine empires. Its

aims summarize debates over the naming of the Middle Eastern Gulf.

Social Media Networking Impact?

Whether all these examples are creating regional change is, however, unclear. The Project on Information Technology and Political Islam at the University of Washington, directed by Philip N. Howard, hosts data demonstrating correlations between online and offline networking. For example, it found that blogs discussing Ben Ali's leadership and "revolution," and to a lesser extent, "liberty" and "economics," peaked with an increase in the size of street demonstrations in Tunisia during the Jasmine Revolution. Likewise, tweet flows that transmitted a "freedom meme" in which people adapted the meaning of the revolutionary successes from Tunisia and Egypt to their experiences, increased across states in parallel with the contagion in street protests. Whether the relationship was causal is a separate matter. Notably, bread-based street protests across these regions transpired long before social media ever came into existence.

However, the uses of social media have, nevertheless, stirred fears of change. As a result, governments and concerned others have responded by creating legal and/or technological firewalls to stifle the channeling of expression and/or protest through them. States have expanded their press laws to include online legal firewalls. Thus, in one example, a 2012 Jordanian law now requires all news Web site owners to obtain accreditation, and holds them responsible for content posted to their sites, including externally posted user comments. The law, requiring them to vet all opinions and commentaries, brings reporting via social media in line with already existing restrictions on legacy news reporting. Second, it stipulates that non-Jordanian-based news sites that do not abide by these laws could be banned from the country. The Jordanian online community has, as a result, expressed concern about how widely and extensively this law will be applied.

More broadly, another concern for those reliant on social media to freely express themselves is the widespread existence of morality laws across the MENA and Gulf. As one case in point, in March 2012, the judge for a case involving the Facebook posting by Tunisians Jaebur Mejri

and Ghazi Bej of naked caricatures of the Islamic Prophet Mohammed handed out the maximum penalty allowed under Tunisian law, namely a total of seven and a half years imprisonment. The two were sentenced for “violating morality” and “disturbing public order.” Regionally, such legalities concerning morality versus freedom of expression are situated at opposite ends of a debate in a manner that parallels debates elsewhere regarding what content constitutes incitement, and is, therefore, not permissible under freedom of expression safeguards.

In other cases, states have shut down online access by closing off individual parts of a country, or by shutting down specific sites and/or simply shutting down access to the World Wide Web altogether. As examples, following the posting of the YouTube film *The Innocence of Muslims*, Egyptian state courts ruled that the film breached morality laws for defaming the Prophet Mohammed, and depicting Islam negatively. As a result, they asked Google to remove the film. Since Google declined, the courts ruled that YouTube should be banned. As a result, YouTube was closed for one month in Egypt. In another case, on November 29, 2012, rather than cutting off a specific site or section of the country, Syria cut off all access to the Internet, in effect removing the Syrian state from existence in cyberspace for two days (along with the 23 percent of its online population). Concerned about the leak of information critical of the regime during the ongoing civil war, the state chose this option, and closed all phone services to at least try to retain control over the media front of the war.

In other cases, rather than restricting access to the Internet or specific sights, governments have maintained site or networking viability in order to track and monitor activists’ movements. One example was the alleged use by the United Arab Emirates’ government of the FinFisher Trojan spyware to track Emirati rights activist Ahmed Mansoor on his mobile phone. Mansour was thereafter physically assaulted, potentially in connection with his movements having been revealed by FinFisher.

It is not only state authorities who have closed or hacked social networking sites, or civil society members who have been their targets. For example, the loosely affiliated and assumedly civil

society members of Anonymous hactivists hacked into the Israel Defense Forces Web site, taking down a blog page as part of Anonymous’s denial-of-service hacking program. In that instance, they did so as part of the escalation in conflict between Israelis and Palestinians in November of 2012. Likewise, states have presumably targeted one another, as in the case of the Stuxnet virus that disrupted Iran’s Natanz nuclear facilities operations. According to many media reports, Stuxnet was created by the United States as part of its Olympic Games cyberweapons program, together with Israel. Media sources further reported that, in order to upload the program the two combined their newer digital networking capabilities with old hand-to-hand sociality, namely by making use of a person with a USB thumb drive. Once uploaded, the worm’s end-result, however, was not just virtual. Stuxnet physically disabled the Iranian facility’s centrifuge operations, thereby slowing down Iran’s nuclear program.

At the same time, targets of these disruptions, whether governments, activists, or just audiences in pursuit of entertainment, manage to circumvent social media use limits. As one example, using technical knowhow, Iranian fans of the Iranian American television show *Parazit* found ways to bypass the state and tune into the otherwise blocked and widely popular series. *Parazit*, produced by Voice of America (VOA)–based operations in Washington, D.C., and created by Iranian expats Kambiz Hosseini and Saman Arbabi in 2008, aimed to foster democratization and mock Iranian state politics by making fun of President Ahmadinejad and other members of the Iranian political elite, like the Green Movement.

Following unrest surrounding the 2009 presidential elections dissemination platforms for the series evaporated. The state confiscated satellite dishes on which the series could be viewed. Additionally, it used smart filters to shut down Web sites critical of it, including that of the VOA’s Persian News Network, otherwise accessible to the 21 percent of Iran’s online population. Unable to tune in, fans instead tuned in via proxy servers, for example via Facebook. When the state, however, also shutdown Facebook (as it has, on again and off again), fans simply skipped around via a cat-and-mouse-like game to continue to upload and download via new proxy locations.

Whether the above outlined efforts are having a direct impact on regional politics or not remains unclear. The majority of the peoples of these regions remain offline, with many of these efforts instead being targeted to international audiences (whether by their choice to opt for social over older media, whose penetration rates remain higher, and/or by choosing to use English over local languages). Therefore, it may be more useful to consider the expression channeled through social media as a barometer of regional public opinion. That is, since most regional public social networking today is operated by young people, and demographically they represent the majority of the population in most states, and in some, even a vast majority, their expressions provide key insights into regional political opinion. Moreover, since young people under the age of 18 are not counted, neither in so-called public opinion polls or elections, and regardless of however circumscribed an impact elections arguably have on governance in what is the most common form of government in existence across these regions, namely anocracies (middling autocratic-democratic systems), the contents channeled through social media today, therefore, prove invaluable for illuminating and understanding Middle Eastern, north African, and Gulf popular opinion and politics, together with the very definition of where these regions begin and end.

Military-Industrial Complex

President Dwight D. Eisenhower warned against the military-industrial complex in his 1961 farewell address, perhaps the most famous such address since George Washington's. Eisenhower feared that the mounting costs of the Cold War threatened America's future. He saw the emergence of a cozy alliance of defense contractors, military leaders, federally funded scientists and universities, and congressional members who used the Cold War as a justification for military expenditures not essential to national security. Eisenhower acknowledged the need for strong defense, but he also saw that vital social programs such as education and medical care might lose out to the demands of the war industry.

Eisenhower urged the nation to recognize that its economic strength was as vital as its military might

to national defense. The military-industrial complex could undermine democracy. He did not fear the existence of the military-industrial complex, but the possibility that it would abuse its power. It might become so strong that it would resist civilian control. Eisenhower's speech was at least in part a reaction to the election of John F. Kennedy, who had promised to significantly increase defense expenditures and strengthen America's nuclear deterrence during the 1960 presidential campaign.

Modern Industrialized Warfare

The need for a permanent defense industry did not emerge until the late 19th century, when weaponry became so complex that it needed an industrial base for development and production. Once President Theodore Roosevelt decided to create a global navy, a separate defense industrial plant was required. Complex weapon systems needed specialized skills, knowledge, and equipment to manufacture them. Civilian factories no longer could be expected to ramp up to production in time to meet the demands of modern warfare. The technologies, industrial plants, and formal coordination of planning between civilian and military leaders necessitated ongoing programs.

President Harry S. Truman's doctrine of communist containment after World War II prompted the Department of Defense to develop nuclear and conventional arms capable of deterring the Soviet Union and its communist allies. The Cold War was a 45-year era of tension between the United States and the Soviet Union. The two superpowers sometimes tested each other, occasionally threatened each other, and were always posed for the outbreak of war. Some critics of the military-industrial complex were concerned that Cold War fears were elevated by those who thought they would reap the benefits of increased defense expenditures, heightening Cold War tensions between the superpowers, rather than reducing them. Others feared that the undue emphasis on empire building through weapons programs would distort the professionalism of the military, tempting officers to focus on advancing their careers through big weapons projects.

Many critics pointed to the practice of "cost-plus" contracts as the cause of defense overspending. Corporations allegedly offered to produce a weapon at a cost significantly lower than it would cost to produce, confident that the military would

ask for additions or modifications that would generate large profits. Members of Congress resisted cutbacks to such programs because jobs in their districts or states might also be cut. The procurement and development process stretches over so many years that programs such as the V-22 Osprey vertical takeoff aircraft stayed alive, despite efforts to close them, because they became too big to allow to fail, a perfect example of investment expectation in action. Defenders of these programs responded that the Soviet threat was genuine, and that only a robust military, equipped with the best arms available, would deter Soviet aggression. While acknowledging that defense spending may aggravate Cold War tensions, they insisted that such spending neither caused nor prevented resolving the tensions. Justifications for a permanent war industry also used the language of economic stimulus to argue that funding such programs increased employment and prosperity.

Today's Military-Industrial Complex

Concerns about the military-industrial complex ebbed as defense expenditures slowly dropped from 10 percent of the gross national product during the 1950s to 3 percent in the 2000s. There has been, however, a significant increase in defense and intelligence expenditures since the 9/11 terrorist attacks on the United States. During President Barack Obama's first term (2009–13), expenditures for national defense and intelligence more than doubled. The United States is the world's leading exporter of military systems, selling tanks, aircraft, missiles, and the support programs necessary to maintain them.

The interlocking interests of large corporations, high-ranking military officers, and members of Congress help explain the persistence of the military-industrial complex. The rise of think tanks such as the Rand Corporation and corporations focused almost exclusively on serving the military's needs, such as Lockheed Martin and Raytheon, created another set of economic interests that promoted investments in defense. They sought to persuade members of Congress to support defense spending through campaign contributions and lobbying. They located their plants to maximize their leverage with members of Congress representing those locations. The building or expansion of military bases in key states such

The U.S. Navy's "America's Navy" iPhone application was released in August 2010. It was created through the work of the Navy Recruiting Command and the advertising and marketing agency Campbell E-Wald.

as California and Texas, and the intentional distribution of defense contracts in many congressional districts, produced vested interests in Congress supporting and defending a large military budget. They donated to research institutes that then advocated policies such as regime change in Iraq that benefited company sales.

These coalitions of mutually interested groups create a "revolving door" employment system, where military and public officials move into jobs in the defense industry while members of the industry move into the government's bureaucracy. A high percentage of retired military colonels and generals work in the very defense industries they once supervised as officers.

Three striking changes in the military-industrial complex occurred in the late 20th century. The first was the transformation of leading defense corporations such as Lockheed Martin into intelligence and security companies, moving away from the military aerospace niche

they once occupied. For example, the Defense Advanced Research Projects Agency (DARPA) funds a Lockheed Martin project to make battlefield intelligence faster and more reliable. The Social Security Administration paid the company to modernize the processing of disability claims. Lockheed Martin is still the nation's largest weapons contractor, receiving roughly \$1 out of every \$10 spent by the Pentagon.

The second significant change is the privatization of combat and support represented by such firms as Blackwater (now Xe) and Halliburton. Companies now supply skills and services that once were the domain of national militaries. They provide trained combat squads, security details, and strategic advice to generals in the field. Support firms such as Brown and Root build and maintain military installations, provide expert consultants for training programs, and furnish other specialized military services.

The final change is the erosion of the sharp divide between civilian and military manufacturing. Military research and development programs helped to create leading-edge software and components that, through mass production, become embedded in civilian products such as the cell phone, the Internet, and global positioning systems. Military technology also successfully landed a man on the moon and helped develop modern digital computers. Now, the defense system depends on the same civilian industries that produce microprocessors and chips for the civilian market to manufacture the components that power high-tech weaponry such as smart bombs and drones.

Military-Industrial-Social Media Complex?

Defense contractors and Pentagon media bureaus work with their personnel and friendly journalists in the outside media to protect the dependent relationship between the nation's industries and the military. Businesses offer defense contractors the ability to use social media, not only to recruit employees and gain business, but also to rebut critics and stimulate support for increased military spending. The armed services and the Defense Department have outsourced some of their social media monitoring to private contractors.

The U.S. Army and Air Force have been especially effective in using social media such as Facebook, Twitter, YouTube, and Pinterest to

champion their causes. They have been adept at posting content appropriate to each forum, such as hard news on Twitter, heroic military action photos on Flickr, recruiting videos on YouTube, and even pastry recipes on Pinterest. They know how to strategically add new content so as not to overload or bore followers.

The official U.S. Army social media guide states that social media have become an integral part of all the branches of the Defense Department. The third edition of the guide discusses the appropriate use of missing-in-action and killed-in-action notices posted on social media, security concerns about social networking, and how to use Facebook and social media sites to present the U.S. Army's official position on issues. The U.S. Army has 124,000 followers on Twitter, almost 1.2 million likes on Facebook, and over 2,500 subscribers on YouTube. The U.S. Air Force has a prominent social media presence. It experienced a 140,000 increase in Facebook fans in March 2012. Its Twitter account recorded over 90,000 fans in one month in 2012.

The Pentagon is concerned about how real or potential enemies may use social media to wage a propaganda war against the United States. Its social media in strategic communication program seeks to monitor social media conversations in real time in order to protect troops deployed in war zones. Such programs counter enemy propaganda by using multiple accounts with different aliases, so-called sockpuppets, to make online contacts on Facebook, Myspace, Twitter, and other social media sites used in Afghanistan and Iraq.

The U.S. Navy granted Lockheed Martin a three-year contract in 2012 to monitor social media in order to gauge public sentiment. Lockheed Martin's Advanced Technology Lab tracks and analyzes tweets to monitor social disorder and conflict. The Pentagon's Digital Engagement Team challenges militant messages on Facebook, Twitter, blogs, and online news sites by placing false articles intended to mislead readers on Arabic social media sites. Apparently Defense Intelligence Agency analysts have been unknowingly passed on as real news to the White House false articles planted by other U.S. agencies.

In December 2011, new sources revealed that the Defense Department used software to monitor Twitter discussions about WikiLeaks. A U.S.

Army private allegedly sent classified diplomatic documents to WikiLeaks, and WikiLeaks in turn released them to news agencies and on the Internet.

Members of the military-industrial complex aggressively use social media to gain entry into sites that criticize it; however, entry comes with a cost. Social media can open the complex to the scrutiny of suspicious users such as WikiLeaks. Just as modern technology is changing the military-industrial complex, social media may begin to change it as well.

Minimal Effects Theory

The minimal effects hypothesis states that political campaigns only marginally persuade and convert voters. The hypothesis was formulated during early research into electoral behavior

between the 1940s and the 1960s. The hypothesis seemed solid and was associated with the general assumption that voters had clear positions on issues and knew where candidates stood on these issues. Since then, the minimal effects hypothesis has been criticized and empirical research since the 1980s has suggested that voters have uncertainties about candidates' positions, and these uncertainties influence voters' decisions. These findings have led to renewed interest in research into the effects of campaigns, with recent published research appearing both for and against the minimal effects hypothesis. Although research into social media is not extensive, recent studies confirm the legitimacy of the minimal effects theory when testing social media during presidential campaigns.

Paul Lazarsfeld and his collaborators at Columbia University opened a new era of thinking by rejecting the old hypothesis that the media have great power. The minimal-effects terminology comes from the seminal review and summarization of research to date: *The Effects of Mass Communication*, published in 1960 by Lazarsfeld's student, Joseph Klapper. Although Klapper never used the phrase "minimal effects" in the book, the key findings were that only a tiny fraction of voters actually change their vote intentions during an election campaign, that audience motivation and prior beliefs influence the interpretation of persuasive messages, and that messages are often discussed among opinion leaders and friends, leading to mediation via two-step flow, as the narrative is told, reinforcing this minimal-effects conclusion.

Assuming that people are more detached from social institutions that used to provide shared interpretative context, and that information channels proliferated and became more individualized, media effects on people's opinions are minimized and dependent on a largely unknown set of factors. As receivers exercise greater choice over both the content of messages and media sources, effects become increasingly difficult to produce and measure in the aggregate, creating new challenges for theory and research.

Before Lazarsfeld's study, the idea was that media overwhelms people and causes people to withdraw from issues. After his contribution, a new generation of scholars sought to justify the discipline and to demonstrate significant effects

through new theories, better measurement tools, and improved methodological designs. Various scholars, such as McCombs and Shaw, hypothesized "not so minimal effects," or demonstrated that if the media could not tell you what to think, they were "stunningly successful in telling its readers what to think about."

The polarity between minimal effects and big effects continued as a central thematic, but it gradually lost its appeal by the early 1970s. Current media research has upended the minimal effects theory through the identification of a broader scope of possible effects, such as influence on attitude and knowledge. Iyengar and Simon identify distinct roles of the media that influence the audience. These media effects are now widely addressed in the communication, public opinion, and political science literature under general headings such as information dissemination, priming, agenda setting, and framing.

Social media services, such as Facebook, Twitter, LinkedIn, FourSquare, Youtube, or Flickr, provide a platform to create online communities to connect people and share information. Because they are also driving forces for transforming citizens, data, and government models, Hong and Nadler undertook an empirical study of measuring the impact of social media use in presidential candidates.

They tested two competing theories of media's effect—the "minimal effects hypothesis," which claims that the competitive edge of a media or technology is minimized as adoptions spread, and the other hypothesis where the media can control, frame, or influence public opinions. They defined the concept of "candidate salience" as the extent to which candidates are discussed online by the public in an election campaign. They quantified this salience by counting the number of mentions that presidential candidates receive on the Twitter social media site. The results showed that high levels of social media activity on the part of presidential candidates (candidates' level of engagement) show the minimal effects theory on the amount of public attention they receive online, even though social media substantially expand the possible modes and methods of election campaigning.

MIT Center for Civic Media

Originally proposed by Henry Jenkins (director of the MIT Comparative Media Studies Program), Mitchel Resnick (professor of learning research at the MIT Media Laboratory), and Chris Csikszentmihályi (Muriel R. Cooper Associate Professor of Media Arts and Science), and located on the campus of Massachusetts Institute of Technology (MIT), the Center for Civic Media (CCM) is the product of a joint endeavor between the MIT Media Lab and the Comparative Media Studies (CMS) Program.

Seen as a bridge between the Media Lab (which focuses on the development of future technologies), and CMS (which focuses on the identification and critical assessment of technical and social systems that provide the infrastructure of globally and domestically dispersed communities, that is, virtual communities), the CCM provides a space for the investigation and engagement of civic journalism tools and practices as they pertain to a variety of diverse populations. Operating from a platform that is bolstered by the fusion of the ideal of transforming civic knowledge into social action via new media technologies, and the concept of a fifth estate, defined as a space in which all have equal opportunity to share and exchange

knowledge, experience, and expertise, CCM is an international hub of new media research, design, and practice.

The original motivation for establishing CCM is multifaceted and founded on the lessons learned about the power of Internet-based political discourse and grassroots activities during the 2006 election season. The disembodied communication that the Internet facilitated during the 2006 election attested to the global transformative nature of such communication and accompanying virtual communities it established. To better understand, harness, and develop such activities and the tools that facilitated them, the CCM (so named to denote an emphasis on any communication practices that strengthen social bonds among and between community members) was envisioned as providing a space in which collaborations between scholars, practitioners, students, and communities would take place in an effort to do the following:

- Revitalize citizen-driven engagement with their governments and with each other, utilizing new media.
- Assist professional journalists in developing contemporary new media-driven communication models in service of their local constituency.
- Provide local communities with a chance to learn about and deploy new forms of civic media that rely on collaborative partnerships between citizens and public and private bodies.

To realize these goals, a threefold plan of action currently undergirds the activities of CCM. Through engagement of select communities with MIT faculty, postdoctoral students, an administrator, and select group of undergraduates, three main deliverables drive the center's daily practices. Specifically, the deliverables are as follows:

- Develop new media technologies to support and facilitate civic journalism.
- Serve as an international hub for critical study and discussion of civic media tools and practices.
- Organize community-based "test-beds" (i.e., development of innovative

technology-driven models of community outreach, communication, and engagement).

As a product of collaboration between the world leaders of citizen-empowered political technologies, MIT's CCM has evolved into a center responsible for developing, critically assessing, and documenting emerging technologies that aid in both facilitating civic journalism and actuating grassroots political movements and activity. Through the use of a variety of channels (including forums and presentations), resources, and experimentation, CCM actively engages with local communities via a "hand-in-hand" approach, with the goal of community partnerships that result in facilitating what it calls the "creat[ion], design, deploy[ment], and assess[ment]" of innovative, technology-rich tools and practices that continuously emerge and affect contemporary society. For example, the CCM has experimented with technologies involved with civil disobedience and phone texting, both of which have a high impact on daily social activities. Such experimentation fuels a fusion between the creation of theoretical frameworks and practical application, which is evidenced in the curriculum, activities, and communication models generated and documented by the center to date.

MIT Media Lab

The Massachusetts Institute of Technology (MIT) Media Lab was founded in 1985 by Professor Nicholas Negroponte and Jerome Wiesner, professor and the science advisor to President John F. Kennedy. The Media Lab is a degree-granting program within the School of Architecture and Planning at MIT in Cambridge, Massachusetts. It offers a degree in media arts and science, and is also a stand-alone research program. The lab originally developed from the Machine Group within the School of Architecture.

The current director of the lab, Joichi Ito, was appointed in 2012. The annual operating budget is approximately \$35 million. Funding for the Media Lab comes from more than 70 corporate sponsors at three different levels. It offers masters and doctoral degrees, but undergraduate students also participate through a research opportunity program. There are 26 different research groups. As of 2012, research is focused on autism and communication technology, the Center for Civic Media, the Center for Mobile Learning, the Center for Future Storytelling, and Consumer Electronics 2.0.

The idea for the Media Lab was conceived in 1980 by cofounder Negroponte. It is known for its interdisciplinary, even antidisciplinary approach to technology, computing, robotics, and machines. Participants are encouraged to draw from any and all areas of interest. In its first decade, research at the Media Lab focused on the digital, specifically in terms of cognition and learning, electronic music, and holography as they related to computing. During the 1990s, the lab's work was particularly well known, and it profited from the technology boom. The focus was on how computing had become part of everyday life, how bits of the digital are embedded into the physical world, such as: wearable computing, wireless communications, machines with common sense, new forms of artistic expression, and new approaches to how children learn.

Approximately 130 start-ups and companies have developed and spun off from the MIT Media Lab. Some key inventions that developed from Media Lab research include the electronic ink technology used by electronic readers such as the Amazon Kindle, Sony Reader, or Barnes & Noble nook; One Laptop Per Child; the game *Guitar*

Children in a school in Peru in 2008 experiment with a laptop from the One Laptop Per Child program, which benefitted from technology originally developed at the MIT Media Lab.

Hero; LEGO Mindstorms; CityCar, a foldable, stackable electric car branded as the Hiriko in Spain; and BiOM, the first bionic lower-leg system for amputees. Researchers who are full members of the Media Lab can share in its intellectual property without paying a license or royalty fee. Nonmembers may use developments two years after the patent or copyright has been filed.

The Center for Civic Media is a joint effort with the MIT Comparative Media Studies Program. It is currently directed by Ethan Zuckerman, author of *Rewire: Digital Cosmopolitans in the Age of Connection* (2013). It defines civic media as any type of communication that strengthens the social connections within a community or develops a sense of civic engagement among the residents of the community. They suggest that transforming civic knowledge into civic action is a necessary part of democracy, so they research and experiment with technologies that

might be used for protests, civil disobedience, or instant voting. Members of the Civic Media Team publish academic articles on media and social movements focusing on regions around the world. Publications focus on issues such as Oaxacan peoples' movements, the Occupy movement, same-sex marriage, youth social movements, and immigrants' rights. The center also offers six courses, including those focused on: news and participatory media, networked social movements, and social television.

Nicholas Negroponte (director from 1985 to 2000), professor of media arts and sciences, graduated from MIT, and has been a faculty member there since 1966. He is also the founder and chair of One Laptop Per Child, a nonprofit association that provides children in developing countries with a durable and very affordable laptop that can connect to the Internet while using limited power. Negroponte is author of *Being Digital* (1995), a compilation of 18 articles he originally wrote as columns for *Wired* magazine, of which he was the first investor. Walter Bender (director from 2000 to 2006) was a founding member of the Media Lab and the head of MIT Media Lab's Electronic Publishing Group, founded in 1978. He held the Alexander W. Dreyfoos Chair and was a professor in the Architecture Machine Group. He also founded Sugar Labs, which developed the learning platform for One Laptop Per Child, but runs on most computers as an alternative to traditional office desktop software.

Frank Moss (director from 2006 to 2011) is professor of the practice of media arts and sciences at MIT. He expanded the lab's reputation for doing practical work, researching ways that technology could be applied to help manage health and cope with illness, disability, and the aging process. During his tenure, the lab also drew on the work of product designers, nanotechnologists, and data visualization work. Joi Ito (current director since 2012) is the fourth director of the Media Lab, and is a Japanese venture capitalist. He briefly studied computer science at Tufts University, and physics at the University of Chicago, but does not have an academic degree. Ito has served as a board member of the Internet Corporation for Assigned Names and Numbers (ICANN), and has invested in technology start-up companies such as Flickr and Twitter. He assisted in developing the first commercial

Internet service provider in Japan, and is the cofounder and chair of Creative Commons.

Mobile Apps

Mobile apps, or mobile applications, are application software designed to run on smartphones, computer tablet, or laptop computers. They may be preinstalled during the manufacturing process, or can be downloaded from various application distribution platforms. Apps assist with specific user tasks such as reading e-mail, the newspaper, e-books, playing games, or making contact on social networking sites.

Some apps are free, whereas others are costly. For apps that cost money, 20 to 30 percent of the revenue goes to the distributor of the app, such as iTunes. The remainder goes to the producer of the app, such as Google. Apps may be purchased, downloaded, or updated through the following distributors: the Apple app store, Google Play, the Blackberry app world, the Amazon appstore, the Android market, the Windows phone marketplace and the Nokia Store. The Apple app store offers downloads from the Apple iTunes Web site. The Amazon app store sells apps for the Google Android operating system. Google Play is an online store available internationally. It sells apps developed by Google specifically for Android devices.

Blackberry app world sells apps for Blackberry mobile phones, including third-party applications.

The Windows phone marketplace is a service provided by Microsoft for its Windows 7 platform. The Nokia store is an app store primarily for the Nokia phone. It was launched in May 2009, and uses the Windows Phone 7 operating system. The seven leading mobile platforms include Apple, Android, Research in Motion, Microsoft, Nokia/Intellisync, Sybase, and Java Platform in Micro Edition. Research in Motion both develops and produces the Blackberry.

Social Media Apps

The apps for Facebook, Twitter, Google+, and Myspace have become a conduit for discussing politics, both nationally and internationally. Politicians use social media to remain visible to constituents and build support. Voters can support their favorite candidate through text messaging, instant messaging, and e-mail. Fundraising can also be initiated through text messaging, Facebook, and Twitter. Candidates use Twitter for broadcasting messages to their constituents, and sometimes for challenging an opponent. Social media apps for mobile phones have changed traditional patterns in American politics, allowing campaigning to be done online.

Facebook and Twitter are also important to political movements in the Arab world. Social media have played a central role in allowing activists to organize protests, promote rebellion, and attempt to overthrow dictatorships. Facebook has been used to create an interactive relationship with the masses and to voice protest against authoritarian regimes.

In Syria, three months after the citizens were granted open access to the Internet and social media, the government attempted to restrict it again. It was discovered that these sites were being used to promote rebellion. After the military crackdown, social media sites were used to draw attention to the situation. In Tunisia and Egypt, social media apps were used to organize and sustain demonstrations meant to overthrow an authoritarian regime. They were particularly effective in attracting droves of young people. Mobile apps have made it easier for dissidents to communicate because instead of using a full-fledged computer, one can use a low-cost portable device such as a mobile phone or tablet in conjunction with apps customized for these devices.

Social media apps have also changed the way in which people access information. Due to the opt-in nature of social media, users receive information from people they know and see as trusted sources. Thus, the information obtained through social media applications might have more of an impact than the same information obtained from the traditional media. Users feel closer to, and thus place more trust in, the opinions of those in their network, rather than messages from government leaders. This might contribute to the power of social media use in helping topple authoritarian regimes. As a result, social media applications have revolutionized politics, both abroad and in the United States.

Mobile Connectivity, Trends in Politics and

Inspired by his vision of humankind as "fundamentally, inherently mobile," and by Captain Kirk's gold flip-top "communicator" on *Star Trek*,

Motorola engineer Dr. Martin Cooper shaped mobile telephony history on April 3, 1973, when he made a call on the world's first handheld mobile telephone. Forty years later Mr. Cooper, now aged 84, is one of 6 billion cellphone owners, millions of whom use cellphones and other mobile devices in all areas of politics, from fundraising for political candidates to monitoring election results.

Some of the earliest examples of mobile connectivity in U.S. political campaigns occurred in the lead-up to the 2004 elections. Because the uptake of cellphones at that time was greatest among young adults, grassroots groups such as Rock the Vote targeted 18 to 25 year olds with text messages to inform them about voter registration procedures and deadlines, engage them in political issues that affected them, and mobilize them to volunteer for campaigns of their chosen candidates and causes.

In the following two years, Working Assets and Mobile Voter, and their affiliate organization govote.org, conducted text-based voter registration campaigns. Student Public Interest Research Groups (PIRGs), nonpartisan organizations that address concerns related to the environment, consumer protection, and government reform conducted face-to-face on-campus, online, and text campaigns that resulted in 75,000 young adults registering to vote in the 2006 elections. Follow-up research indicated that a text message from Working Assets and Student PIRGs on Election Day in 2006 increased the likelihood that young adults would vote by approximately 3 percentage points, and during the 2008 primaries, young people were 4 percentage points more likely to turn in voter registration forms after receiving a text message reminder from Rock the Vote.

Engaging young voters also had early successes abroad as well. In one of the first examples of young people creatively using mobile phones in an election period, a ringtone made from a clip of an intercepted wiretapped telephone conversation between Filipino President Gloria Macapagal Arroyo and an electoral commissioner, brought widespread attention to the president's attempts to influence results of the 2004 election. Also that year, in the general election in Spain, a text message campaign encouraging young adults to vote for the Spanish Socialist Labor Party was likely the key catalyst for the party's surprise

victory. Peer-to-peer text messaging has also been extremely influential in mobilizing political causes, from the Arab Spring citizen uprisings in Tunisia, Egypt, and elsewhere in the Middle East and north Africa to flash mobs and protest rallies in Korea and China.

By 2005, mobile delivery of news had grown tremendously. United Kingdom (UK) mobile phone customers accessing news services doubled from 2004 to 2005, by which time 5 million pages of news and information were being accessed in the UK each week through mobile devices. The BBC established a text news update service in April 2005 for the May election.

From then on, mobile-delivered political news offered an immediacy previously unseen, particularly on election night. In the 2010 midterm U.S. elections, the first iPhone app for local TV news stations was released. Preparing for the 2012 election, news organizations consulted mobile app experts to determine how to best optimize election news content to maximize users' experience through push notifications and interactive results maps. Mobile page views of 2012 election results, compared to those during election night 2010, increased by 350 percent.

Mobile Trends in the Global South

While these figures illustrate substantial mobile growth in the United States and western Europe, mobile trends are the most remarkable in emerging regions. In most newly industrializing regions, cellphones are far easier and cheaper to obtain and use, and, often more pervasive than Internet access. Many areas in the global south that are now covered by cellphone networks were never connected to landlines; thus, cellphones are the only means for one-on-one communication. Further, given vast increases in mobile broadband expansion, defined as high-speed access to the Internet and other data services over mobile networks, mobile communication is changing politics throughout the global south.

In what is considered the first "mass mobile phone" elections in India, the 2007 state elections in Uttar Pradesh saw a shift in caste identity negotiations. The Bahujan (meaning "people in majority") Samaj Party (BSP) that has historically drawn a loyal voter base from the Dalit (the ex-Untouchable, or Scheduled caste), was able to

cooperate with Brahmins by using cellphones to directly communicate with voters who had historically been influenced by a hostile mainstream media. The party used mobile telephony to reach a constituency of poorer voters who were limited in their ability to travel or receive information.

In Haiti, where 75 percent of citizens use cellphones, voters use their phones to obtain location-specific campaign and polling information and confirm their voter registration status. Use of mobile telephony was particularly helpful in organizing the November elections following the January 12, 2010, earthquake that killed a quarter of a million people, displaced 1.5 million, and left the capital Port-au-Prince in ruins and the Haitian government in disarray.

Political Accountability

Along with new ways to engage citizens in elections, mobile communication is also beneficial to enhance political accountability and reduce election fraud in the global south. Citizens with camera cellphones now monitor elections outside voting locations, scrutinize conduct of persons entering and leaving voting sites to detect possible theft of ballots, take pictures of posted local election results, and submit the images to watchdog groups and analysts.

Across the African continent, where mobile adoption increased by 550 percent between 2004 and 2009, the cellphone market is the fastest growing in the world. Given the estimated 732 million subscribers in 2012 in Africa, mobile telephony across the continent and in other emerging regions, provides opportunities to reach the broadest number of citizens during electoral periods. Researchers found cellphone usage in Mozambique and Namibia enhanced voter education and participation in provincial and national politics, improved electoral processes, augmented demand for reducing corruption, and increased political accountability. New research has found challenges, however. Whereas the vast uptake of mobile telephony can improve political accountability, it can also facilitate politicized violence.

Future Trends

There have been numerous demands for mobile voting. In the Czech Republic, for example, research reported that 55 percent of Czech nonvoters say

they would cast a ballot if they could vote via mobile phones, which would add 500,000 voters in Czech elections. Numerous municipalities have used Internet voting in municipal elections in Canada. Estonia, where citizens hold national smart-card IDs, has offered online voting since 2007.

Anonymous routing protocols, called shuffles, are currently in development for possible e-voting in the future. Through the protocol, voters encrypt their ballots and submit the encrypted ciphertexts to one of a team of vote talliers who then set up an anonymous network, shuffle encrypted votes, decrypt ciphertexts, and recover votes. E-voting confidentially would be guaranteed because at least one member of the tallying team conceals the permutation used in the shuffling process, eliminating chances of ballots being traced back to specific voters.

Given, as of May 2013, the Pew Internet and American Life Project reports 91 percent of U.S. adults have a cellphone and 56 percent have a smartphone, mobile voting will see increasing demand. However, with 4,600 voting jurisdictions in the United States, diverse election methods and procedures, and concerns of voter validation, e-voting technology may well be in place long before mobile voting policies would be implemented.

Mobile Media User Data Collection and Privacy Protection

Both commercial and political decisions increasingly rest on data analytics and predictive algorithms provided by mining increasingly large databases of user-generated data. Mobile data collection raises privacy concerns that are to a certain extent common to those prompted by data collection in online environments, but are also medium-specific. However, debates about the nature of harm derived from privacy violations run counter to the claim that users willingly give up personal information in return for benefits, such as free access to social media platforms. The new privacy landscape is yet unsettled, although it is not expected to depart significantly from the traditional "notice and choice" approach common to privacy regulations in both the United States and the European Union.

In both online and mobile environments, phenomena such as behavioral advertising (the targeting of consumers based on the recording and

analysis of their past behavior, including combinations of Internet-based, mobile, and offline behaviors) or large-platform user data collection and third-party data sharing have prompted concerns about (1) the meaning of personally identifiable information (PII), given that de-identified user behavior data may be re-identified with the addition of, for example, location information collected by mobile devices or their unique hardware identifiers; (2) the transparency of data collection practices, given both the lack of standardized, readable privacy policies on Web sites, the difficulty of reading privacy policies on a small mobile screen, and the fact that only a small percentage of users actually read these policies; (3) the form and manner of data collection disclosures, including for example at what point in a transaction a Web site or mobile app should display the warning that user data are being collected; (4) the conditions when user consent for data collection is required and the nature of the consent, for example, whether the consent should be explicit or implicit; (5) the availability and form of user means of signaling data collection preferences, for example, whether the user is able to opt out of the data collection process without loss of site or app functionality, or whether the user is able to modify or delete personal data already collected; (6) the distribution of responsibility for protecting user privacy among various-stakeholders, given the increasing complexity of the personal data ecosystem; and (7) the nature of such privacy protections, for example whether privacy protection should be achieved via legal instruments or industry self-regulation.

These concerns are magnified in the mobile environment because of the volume and nature of the mobile data collected by various players in the mobile ecosystem, which includes mobile carriers, operating systems, mobile application developers, mobile delivery platforms, advertising and marketing agencies, advertising exchanges, or advertising networks. Certain types of mobile data collection practices have prompted added privacy concerns because of their increased potential for user identification. These data collection practices include the mobile collection and display of location information (considered particularly sensitive because it presents added opportunities for harm, such as stalking or identity theft), the

ability of certain mobile apps to access users' contact lists, photos, and other personal utilities on mobile devices without users' knowledge, and the use of unique device identifiers (UDID) by mobile applications in combination with location or other demographic data.

Children's Online Privacy Protection Act

Because of the mass adoption of mobile devices, the privacy regulatory landscape is shifting in both the United States and the European Union, although these developments continue the "notice and choice" approach that puts the onus on the user to self-manage privacy preferences. In the United States, the regulatory framework consists of: applications of existing privacy laws to the mobile environment, most notably the Children's Online Privacy Protection Act (COPPA); Federal Trade Commission (FTC) recommendations regarding best privacy practices in online and mobile environments; and enforceable and voluntary industry self-regulations. Additionally, current legislative initiatives in Congress, as well local legislative instruments, for example the California Online Privacy Protection Act (OPPA), will potentially influence the establishment of national privacy standards.

COPPA, enacted in 1998, requires the FTC to formulate and enforce regulations concerning children's online privacy. COPPA applies to operators of commercial Web sites and online services (including mobile apps) that collect, use, or disclose personal information from children under the age of 13, or have actual knowledge that they are using that kind of data from third-party sources. COPPA requires operators of such services to maintain the confidentiality and security of the personal information collected from children, to retain such information only for as long as necessary to fulfill the purpose for which the information was collected and delete it afterwards, and make their privacy policies transparent by posting notices, obtaining verifiable parental consent before collecting information from children and giving parents access to their children's personal information. An amendment to COPPA rules that went into effect on July 1, 2013, applies directly to mobile data because it extends the definition of personal information to include persistent identifiers that serve

to recognize users over time and across screens, including: geolocation information sufficient to identify a child's address, photographs, and video and audio files that contain a child's image or voice. The FTC applied the COPPA standards against a mobile operator, W3 Innovations, for the first time in 2011.

The FTC privacy recommendations, in a series of 2012 and 2013 reports, outline a comprehensive privacy framework applicable to both online and mobile data collection: privacy by design, simplified consumer choice, and transparency of consumer data collection and sharing, including consumer education. Privacy by design, a concept developed by Information and Privacy Commissioner of Ontario Dr. Ann Cavoukian, recommends that organizations think proactively about implementing privacy safeguards at the technological design stage and throughout the lifecycle of the data collection and use process. Recommendations pertaining to simplified consumer choice cover the conditions when companies need to provide privacy choices for their customers.

Companies need not provide additional privacy choices when they engage in activities consistent with the context of transaction that a customer already accepted; in contrast, third-party data sharing or "retargeting" (the practice of delivering personalized ads on third-party Web sites based on a customer's history of online activity) would require additional privacy disclosures. Finally, the FTC recommended increased transparency in regard to data collection practices, increased consumer access to personal data thus collected, standardization of privacy notices, and better consumer education. In particular, the FTC recommended the creation of a centralized Web site where data brokers would identify themselves and allow customers to access their personal data.

Industry Self-Regulation

Several industry trade associations, such as the Direct Marketing Association (DMA), have enforceable self-regulatory standards regarding user privacy in the mobile environment that are applicable to any joining member. A notable voluntary self-regulatory mechanism is the Do-Not-Track policy proposal introduced by the World Wide Web Consortium (W3C), which provides

technology that enables online users to opt out of third-party Web tracking. The DMA agreed to honor the Do Not Track system, and the most recent versions of browsers such as Mozilla's Firefox, Microsoft's Internet Explorer, Apple's Safari, and Google's Chrome also provide support for this option. In the mobile environment, Firefox for Android was the first browser to support the Do Not Track feature, and Mozilla is currently developing an open source mobile operating system implementing the Do Not Track standard. Apple has adopted a Do Not Track framework for iOS6, which gives the user a single control to turn on or off tracking through ads, with Google said to honor this option. The main criticism of this initiative is the fact that it relies on companies' voluntary (nonenforceable) commitment to honor user preferences, thus its effectiveness is questionable.

In the European Union, the main legal instrument applicable to mobile privacy is the ePrivacy directive adopted in 2002 and amended in 2009, which regulates the processing of personal data in the EU digital communication sector. The ePrivacy directive requires EU Web site owners to obtain affirmative consent from users before installing and running cookies or other user data collection technologies on devices. Other privacy policies, such as the General Data Protection Regulation (2012), also known as the Right to Be Forgotten, may also be applicable.

Mobile/Smartphone Messaging

One of the key technologies to facilitate and revolutionize protest movements in the last five years has been mobile phone messaging. Texting has always offered a quick, portable, and mostly secret way of organizing events in real time. The arrival of smartphones has taken this kind of organizing and information dissemination to a new level. Videos shot on mobile phones have been key tools in the hands of people seeking to change the world. The introduction of free messaging apps on smartphone and real-time video chat is pushing the envelope even further.

Mobile phones have gone from being a luxury to a necessity over the last decade. While initially, cell phones were valued for their ability to deliver wireless calling, gradually text messaging has become a predominant use. Text messaging appeals to users because of its low cost compared to calling. However, as with any app, users have been able to extend the usefulness of text messaging far beyond a call replacement app. This is particularly true of younger people, who have come to use text messaging as a primary form of communication, going so far as to create an entire syntax to facilitate rapid texting. The original forms of mobile messaging are SMS and MMS. SMS stands for short messaging service, as the name signifies users are allowed to exchange short messages, generally around 160 words. MMS stands for multimedia messaging service, and allows users to append photos, video, and audio files to text messages. Both these forms can be found on even the most basic of mobile phones. Users are charged for both sending and receiving texts over the service provider's network; however, low-cost bundles are usually available. The pricing for international text messaging is generally much higher than for local or domestic texting.

Mourners at a funeral of a protester use phones and cameras to record a speech in Bahrain on February 18, 2011. Along with texting, Arab Spring protesters posted content from their phones directly to social media networks, including Facebook and Twitter.

Research In Motion (RIM) transformed mobile messaging through the introduction of its BlackBerry messaging service, or BBM. The distinctive feature of BBM was that it allowed messaging with other BlackBerry users anywhere in the world for free. Users were able to create profiles on the BlackBerry network, and even if they changed their numbers, their BBM identity remained unchanged. This opened up a new kind of messaging. Not only were users able to reap large savings by avoiding carrier charges, but the BlackBerry network also offered them privacy. This meant that people could instantaneously send and receive messages from anyplace for free and without scrutiny.

The arrival of the next generation of smartphones, heralded by Apple's iPhone, has given birth to a whole new industry of messaging called over-the-top (OTT) phone services. Free

messaging services like BBM are the most popular OTT apps. Apps like Skype, WhatsApp, and Viber allow users to send and receive messages for free. Users still incur data charges from carriers, but this can be avoided by using Wi-Fi services. These services go even further than BBM, in that they allow users to exchange videos as well as make VOIP calls from their phones. In addition, popular social networking sites such as Facebook and Twitter also have apps that allow users to post updates from their smartphones.

Influence

The power of mobile messaging has been recognized by politicians and citizens alike. In 2008, then presidential candidate Barack Obama announced the name of his running mate through a text message. In 2012, shortly after winning the election, Obama posted an update on Twitter, through a smartphone, that was shared by half a million people. However, the use of mobile messaging for campaigning goes beyond major announcements; it has become an integral part of communication strategy. A study by the Brookings Institute identified three ways in which mobile phones were used in campaigns: to organize activists, to get the message out, and for fundraising.

The power of mobile messaging can also be seen from recent international events, such as the Arab Spring. During the Arab Spring, particularly in Egypt, protesters were able to use mobile messages to organize themselves in real time. In other cases, text messages are used to organize flashmobs. Beyond merely texting, protesters have been able to use smartphones to record video and directly share it from their phones. These videos eventually became the primary way that the world was able to watch the Arab Spring unfold. Particularly with the introduction of OTT services, mobile phone users are able to post messages directly onto social networking sites such as Twitter and Facebook. Instead of reaching a few hundred, now messages can instantly be broadcast to thousands of viewers.

Mobile phone messaging has not only been instrumental in organizing protests, but has also been widely and effectively used in advocacy movements. SMS is a widely used tool of information dissemination in developing countries where mass media is not highly developed. Various

organizations have been able to use SMS mailing lists to call people to action, update audiences on meetings, and disseminate the latest news.

The success of SMS has led to many governments seeking to censor and repress the use of mobile messaging. Recognizing the ability of mobile messaging to spread information quickly, more and more governments have sought to restrict the use of SMS and social networks during times of unrest. Recent examples include countries such as Iran, Pakistan, India, China, and Sri Lanka. Some countries, such as Pakistan, have even sought to permanently censor certain words from being transmitted through mobile messaging.

Conclusion

Mobile messaging is one of the oldest of the mass social media used in politics and protest. However, the introduction of smartphones and OTT services has pushed the envelope further. Recent years have shown the flexibility and utility of mobile messaging across the globe. However, as with other social media, there continues to be a struggle between citizen effort to use this technology and government attempts to contain the perceived threat from this technology

Moblogging

The term *moblogging* combines the words *mobile* and *blogging* to indicate a blog maintained using a mobile device. Before moblogging, bloggers would have to update their blogs from a desktop computer; early blogs were limited in the ways in which users could participate in and/or respond to content. English dictionaries have recognized “moblog” as a term since at least 2003, though both the term and the practice existed before this date.

Canadian Professor Steve Mann is credited with creating moblogging’s forerunner when he invented his wearable Wearcam computer in 1980. Joi Ito, the director of the MIT Media Lab, notes that in February 1995, Mann began uploading Wearcam pictures to wearcam.org as he walked through the streets interacting with people. This event is arguably the first moblog post, though the actual term was not coined until November 2002. American Information Architecture expert Adam Greenfield is credited with coining the term, and was an early practitioner of moblogging.

Moblogging was made possible on a mass scale as a result of Web 2.0 and mobile communication technology. *Web 2.0* is the term used to describe how the Internet shifted from a passive and static process, whereby users would read unchanging content on fixed Web pages, to a dynamic and social practice, where Internet users could collaborate in online communities to create, post, and follow ever-changing Web page content via online dialogue and interaction. Some of the first examples of Web 2.0 were seen in wikis and interactive blogs. With the increased popularity and functionality of mobile communication devices and networks updating one’s blog or contributing

to/following another’s blog no longer required the user to be positioned at a desktop computer; thus, moblogging was popularized.

There are two major types of moblogs. Macroblogs are where writers can write at length about a topic and can include other content such as images and/or video. Macroblogs are moblogs when they are created and/or updated using mobile technology, though Internet users tend to associate this blog format with desktop computing because of the time that the longer format takes to create.

Microblogs, by comparison, tend to consist of short status updates, facts, opinions, and trivia with other content such as images and/or video. Some popular formats for microblogging include Twitter and Facebook. Though microblogging can be done via desktop computing or mobile devices, it is more associated with moblogging because of its short format (e.g., Twitter restricts users to 140 character postings) makes it easier to compose when mobile, and because the popularity of microblogging formats increased with the popularity of mobile communication technology. Other moblogging tools include BlogPress, Tumblr, TypePad, and BlogWriter.

One criticism of micromoblogging is that it is more self-centered in its content. This is perhaps due to the fact that the short form of writing that is encouraged does not allow users to engage significant topics, and is a function of mobile communication technology that encourages personal communication by and about the self. Macroblogs are thought to be better for detailed analysis of more substantive social issues and more in-depth user discussion. Critics also point to the heavy commercialization of moblogging because of its ability to reach consumers on the go.

Many celebrities consider moblogging a key aspect of their marketing strategies as they can create, promote, maintain, and extend their particular brand(s) by giving mass groups of fans access to personal details of their daily lives. Several celebrities have also damaged their personal brands by moblogging racist, sexist, homophobic, and otherwise discriminatory content to fans, only to later apologize for these views via moblogging. Critics also argue that moblogging is a contributing cause to the growing phenomenon of nomophobia, whereby individuals report feeling anxiety when

they are without mobile technology because it constitutes an experience of severe social isolation.

On the other hand, moblogging technology has also been used to advance prosocial goals and causes. Moblogging has been used to foster collaborative learning and social interaction opportunities in virtual classrooms for subjects ranging from philosophy to foreign language study. Also, moblogging played a pivotal role in communicating news of protests, organized opposition, and human rights abuses to the world during events such as the Arab Spring and the Syrian civil war when governments attempted to stay in power by shutting down or controlling mainstream media channels (such as radio, television, or newspapers). In this way, mobloggers have blurred the line between citizens and journalists.

Moblog.net

The term *moblog* was coined by Adam Greenfield in 2002 to describe the practice of mobile blogging. Greenfield helped coordinate the First International Moblogging Conference held in Tokyo in 2002, where organizers defined moblogging as, "a blanket term that covers a variety of related practices. At its simplest, moblogging is merely the use of a phone or other mobile device to publish content to the World Wide Web, whether that content be text, images, media files, or some

combination of the above." Moblog.net offers a platform for this user-generated content. Users have the ability to upload pictures on the go with their cellphones to the Internet via the Moblog.net Web site. Users create a moblog via Moblog.net and can share their photos with users following similar content on the site. As with other forms of social media, Moblog.net is instantaneous, and users can upload images and videos to influence and shape activists, mainstream journalism, campaigns, voters, and political culture.

Although moblogs today are sent from cellular phones or tablet computers, it is believed the first moblog post was sent by Steve Mann in 1995 from a "wearable computer" at the University of Toronto. The device was less of a computer, and more of a photographic device intended to take undercover pictures of dangerous situations for human rights workers. On February 22, 1995, Mann posted text from his wearable computer to his server with an image.

Moblog.net and the act of mobile blogging became widespread as the popularity of cellular phones enabled with cellular, video, and wireless technology grew. In 2012, it was estimated that 114 million Americans used smartphones, according to Comscore. The vast majority of adults between the ages of 18 and 54 own smartphones; the overall market is more than 50 percent penetrated.

Influencing Citizen Journalism

The rise of mobile blogging via Moblog.net has simultaneously influenced the rise of citizen journalism, in which public citizens—not professional journalists—share and collect news and information. Citizen journalists do not always seek out stories. Often, they are in the right place at the right time, and can snap pictures of images that tell stories of the political climate from around the world. Some images go viral, with millions of users viewing them, and they become part of mainstream media. The ability to capture footage and images and send them to newspapers, both online and print, and broadcasters alters the balance between traditional media outlets and citizen media.

Moblog.net allows users to search images based on keywords with which the images are tagged. One example of popular political content

on Moblog.net is a user by the name of “kombizz.” The user has a profile, and describes him- or herself as someone who grew up in Iran and fell in love with photography. One image taken by Kombizz was taken in January 2012 outside the U.S. Embassy in London where demonstrators, organized by the Stop the War Coalition, gathered against Western intervention in Iran and Syria. A woman holding a sign reading “Choose Peace” was pictured sitting next to Tony Benn, president of the Stop the War Coalition. Other images posted from the protests include citizens carrying signs with the message “Don’t Attack Iran.” Another user, “taniwha,” posted images of military drones, unmanned aerial vehicles, over common land. This post was tagged as one of the most popular posts across Moblog.net between July and December 2012. Kombizz and taniwha, like many users, posts images that spark conversation and dialogue among followers.

Special Features

Moblog.net users can further influence political and popular culture dialogue through the use of geotagging. Many cellular phones are enabled with geotagging features to automatically detect the user’s location. Moblog.net also allows users to pinpoint their location on a map. This helps detect where images are taken. Moblog.net also includes a feature that allows for other users to add tags to posts. For instance, if an image or post is tagged as “American Embassy,” another user may include the tag “UK” to provide additional specificity to the post. Moblog.net has also integrated groups for shared moblogs.

In addition to Moblog.net, other platforms dedicated to mobile blogging, or blogging platforms that support mobile devices, include Jaiku.com, BusyThumbs, Mobypicture, NowThen, Utterz, Treemo, Twitter, Facebook, and Tumblr.

Moblog.net’s overall popularity has waned since the evolution of applications on iOS and Android smartphones. Applications now allow for instantaneous uploading to popular sites such as Twitter and Facebook. However, the site still retains users who have established image feeds and followers.

MOMocrats

MOMocrats is a national online organization that hosts political blogs written by progressive mothers, supports progressive candidates, and urges women to become more engaged in politics. Their slogan is “Progressive Moms: The Revolution Begins at Home.” MOMocrats was founded in 2007 by “mombloggers” Stefania Pomponi Butler, Beth Blecherman, and Glennia Campbell, who invited other prominent women bloggers such as Joanne Bamberger (Pundit-Mom), Stephanie Himel-Nelson (Lawyermama) and Jen (oneplustwo) to join them. MOMocrats has been discussed in print media outlets such as the *New York Times*, the *St. Louis Post-Dispatch*, and the *San Jose Mercury News*.

On July 27, 2008, MOMocrats was featured as a *San Francisco Chronicle* blog of the week. Internet sites such as Daily Kos, Politico, the Huffington Post, and Fem 2.0 have covered MOMocrats, and their writers have been featured on CNN, NBC, and CSPAN. They contribute to the *Huffington Post*’s “Off the Bus” feature. During the 2008 presidential campaign, MOMocrats was among the 124 blogs credentialed to cover the Democratic National Convention. A reader survey conducted in 2011 indicated that 99 percent of MOMocrats readers were female, and 86 percent were “Caucasian/white.”

Online Presence

MOMocrats has developed a broad online presence. In addition to their primary Web site, MOMocrats maintains a Facebook page, a “MOMochat” podcast, MOMocrats Messenger, and a Twitter account, where they use the popular hashtag “SheVotes.” In October 2012, the organization had 2,028 Twitter followers. MOMocrats has participated in new media conferences such as BlogHer and Blog World Expo.

Campaign Involvement

MOMocrats actively promotes progressive political candidates. Its “Run, Mama Run” interactive tool (MOMocrats.com/run-mama-run) allows voters to identify local, state, and national Democratic women candidates and contribute to their campaigns. MOMocrats also supports progressive male candidates. During the 2008 Democratic presidential primary, it backed John Edwards. In 2012 they endorsed Barack Obama and linked to the Obama campaign’s gottaregister.com voter registration tool on its Web site.

A number of prominent female political figures have blogged for MOMocrats and/or appeared on their MOMochat podcast, including First Lady Michelle Obama, U.S. Senator Kirsten Gillibrand, Kansas City Mayor Kay Barnes, Congresswoman Allyson Schwartz, Congresswoman Carolyn Maloney, NARAL Pro-Choice America President Nancy Keenan, and MomsRising.org cofounder Kristen Rowe-Finkbeiner.

MOMocrats has supported issues such as pay equity, reproductive choice, public education, fair trade, environmentalism and green entrepreneurship, expanded access to and public funding for women’s health care, and antibullying. It has opposed conservative budget proposals, questioned the wars in Iraq and Afghanistan, and criticized a number of conservative political figures. Despite its partisan perspective, however, it objected to sexist coverage of congressman and Republican presidential hopeful Michele Bachmann during the 2012 Republican primary campaign.

MomsRising.org

MomsRising.org was founded by Joan Blades and Kristin Rowe-Finkbeiner. Prior to founding MomsRising, Joan Blades and her husband, Wes Boyd, were also cofounders of MoveOn.org, a Web site that began in 1988 to oppose the impeachment of President Clinton. Despite its predecessor, MomsRising.org is defined as a nonprofit, nonpartisan advocacy organization. With a social media reach of more than 3 million people, MomsRising.org is focused on a more family-friendly America. This Web site is sustained by the content generation efforts of 700 bloggers, who write about the following campaigns: maternity and paternity

leave, open flexible work, toxic free families, health care for all, early care and education, realistic and fair wages, and sick leave (paid). These are collectively called MOTHERS campaigns.

One of the primary ways that the MomsRising organization communicates with others about maternity and paternity leave is through a traveling display of onesies (one-piece baby outfits) that are decorated and mailed from moms (and supporters) across the nation. This ONEsie campaign serves as a reminder to state and national leaders that lives are positively and negatively affected by family policies. In addition to the ONEsie campaign, MomsRising.org also promotes open flexible work policies through a guide, titled “The Custom-Fit Workplace: Choose WHEN, WHERE, and HOW to Work and BOOST YOUR BOTTOM LINE.” To focus on the issues regarding toxic free families/households, MomRising.org urges its members to send a persuasive letter Congress focused on fixing the Toxic Substances Control Act and eliminating the usage of BPA in household items.

To encourage members to advocate for national health care programs (i.e., the Child Health Insurance Program (CHIP) and Medicaid), MomsRising emphasizes the importance of writing members of Congress about health issues. Early care and education is another issue promoted by MomsRising, which encourages members to share their child care search experiences and their opinions regarding affordability of child care services with members of Congress. To promote realistic and fair wages, MomsRising.org urges members to communicate with members of Congress about the importance of the American Jobs and the Paycheck Fairness Acts. Finally, MomsRising promotes paid sick leave for women through the support of the Healthy Families Act.

Upon joining the Web site, each new member is sent an e-mail requesting him or her to invite five family and friends to become members. To reiterate this grassroots membership strategy, MomsRising often sends a holiday-themed “High Five” e-mail to recruit five individuals to join the Web site. To communicate with its members about the importance of women-themed political issues in an alternative fashion, members are encouraged to host house parties to show a documentary titled “The Motherhood Manifesto” to their family and

friends. To supplement the documentary portion of the viewing party, hosts are also supplied with a discussion guide to spark conversation about the content in the documentary. The official premiere of the documentary was held in Washington, D.C., in the Senate office building. Senators Ted Kennedy, Chris Dodd, Barack Obama, and Hillary Clinton cosponsored the premiere, and numerous senators attended the event.

The primary blog entries on the MomsRising Web site are contributed by MomsRising readers, ranging from politicians and governmental administrators to full-time and part-time mothers focused on the MOTHERS campaigns. Each of the blog entries features a Twitter button and a Facebook “like” button to share the stories with others on social media networks. MomsRising has a robust presence on Twitter, with more than 23,600 tweets, following over 12,500 people, and 24,200 followers.

One of the ways that MomsRising engages its followers is through smaller social media campaigns such as National Women’s Health Week Bingo. Participants share their process on their personal bingo cards throughout the week, and the first 50 people who are participants in this event win a prize from the MomsRising group. MomsRising has over 26,600 “likes” on Facebook. Most of the organization’s posts are picture based (memes). The organization’s Facebook messages reinforce Facebook campaigns and messages to extend the organization’s reach on social media.

MomsRising has almost 40 boards, slightly under 900 pins, and almost 100 “likes” on Pinterest. The organization’s boards range from “Pin Your Made in the USA Finds” and “Books Worth Reading” to “Paid Family Leave” and “Brilliant Famous Women.” With slightly over 1,200 followers, this organization has an active presence on one of the newest social media Web sites.

Since July 2008, MomsRising has maintained a social media presence on YouTube. With over 110 subscribers and almost 143,000 views, this organization posts almost four videos and playlist contributions per month. These videos range from “Get Your Groove On, Mom—and Go Vote!” to “First Lady Michelle Obama Addresses MomsRising.org’s Food Power Conference.” To focus on additional women’s issues and concerns, MomsRising

features a comprehensive Blog Roll consisting of numerous individual and organizational blogs focused on women's issues and concerns. These blogs range from "A Better Balance" to "The California Work and Family Coalition" blog.

Monarchies, Social Media, and Politics

The need to communicate over vast empires is not unique to modern monarchies. Poor or abstract communication is cited as a reason for the fall of empires from Rome to Britain. Monarchs in the digital age, however, have an unprecedented array of communication tools that can disseminate information with subjects while creating an appearance of approachability. Rulers who have embraced digital media as a political or social advocacy platform have experienced both the benefits and disadvantages of digital accessibility. Although the use of the Web, Twitter, Facebook, and similar platforms as links between the Crown and its public is becoming an increasingly frequent phenomenon, two cases in particular stand out as models of ways in which social media can be adopted by modern-day monarchies. Queen Rania al Abdullah of the Hashemite Kingdom of Jordan and the British royal family are different from one another culturally, religiously, and historically; yet, each has developed an extensive

and effective paradigm for how to integrate these intensely democratic communication structures within a monarchical context.

Queen Rania

Born in Kuwait, Queen Rania has a background in marketing, and worked for Apple's marketing department prior to her marriage in 1993. She is a global fashion figure, respected by Western media, and she uses her global visibility to champion the rights of women and children, encourage broadband interconnectivity, and promote the need for education, which she believes is key to improving the economic and living conditions of Jordanians. Within Jordan, however, she is often perceived as having too great an influence over her husband's monarchy. Because of her marketing and technology background, Queen Rania understands how to leverage the power of the Internet to bring about change. This is especially important because there are no Internet restrictions in Jordan. Therefore, she is extremely active on social media and the Internet, using it to communicate with her four children when she is away. Her Twitter account, @QueenRania, is followed by more than 2.5 million people, and she uses the tag line "A mum and a wife with a really cool day job."

Queen Rania has a Web site, Facebook page, YouTube channel, and Flickr and Twitter accounts, all of which are actively updated (appearing to make some of the posts herself) with news of her causes, as well as stories about the royal family. She will also conduct interviews via social media. Queen Rania believes that being a virtual queen allows her subjects to be closer to her and fosters cross-cultural understanding and equal rights. As a result, she was selected in 2010 as the third most influential leader in social media, behind Barak Obama and 10 Downing Street. At that time, only one in five leaders were utilizing social media, according to a Digital Policy Council study. In 2012, she was ranked fourth, but the number of world leaders using social media had increased to three out of four.

While social media has created an international platform for potential change, Queen Rania has experienced increased scrutiny because of her global visibility. On her 40th birthday in 2010, she flew guests in from around the world for a luxurious birthday celebration in the desert

Queen Rania of Jordan, center, stands between Microsoft Chairman Bill Gates and Prime Minister of the United Kingdom Gordon Brown at the annual meeting of the World Economic Forum in Davos, Switzerland, on January 25, 2008. Others pictured include the musician Bono, President of Nigeria Yar' Adua, and Secretary General of the United Nations Ban Ki- Moon.

canyon of Wadi Rum. Coverage of this event led to widespread criticism of the monarchy's lavish lifestyle. As a result, Queen Rania was advised to scale back her activities in order to improve her reputation and demonstrate that she does not play a prominent role in ruling the country. Plans for a Queen Rania Foundation have been halted, in spite of a social media design logo contest, and her appearances, especially in the Jordanian press, have been minimized. Such curtailment is crucial because criticism of her husband's reign has grown since 2011. There is a sense that her global connectivity and Western appearance disconnect her from Jordanians, especially traditional Bedouins. It is a Catch-22 that many leaders face with social media and international outreach.

Queen Elizabeth II

Queen Elizabeth II of England has navigated the pros and cons of new technology usage throughout

her reign. In 1957, the queen's first televised Christmas message, which had the theme of technology, expressed a hope that the new medium would allow her messages to be more personal and direct. The 2012 Christmas message was delivered for the first time in 3D. Queen Elizabeth also makes personal use of a BlackBerry and an iPod. However, the British royal social media channels, unlike those of Queen Rania, are not designed to provide personal access to the monarchy, but to create professionally produced images of a hard-working and caring royal family.

Embracing Flickr in April 2010, the first photo was of the queen visiting a cancer clinic. The official royal Web site features links to the British monarch's royal YouTube channel, and Facebook, Twitter, and Flickr pages, as well as links to other government sites. The queen was Google's first royal client in 2007, and the YouTube channel had more visitors than the White House channel in its first

two days. In 2008, it had twice as many subscribers as Queen Rania's YouTube channel. The first royal tweet occurred in 2009 (now over 400,000 followers), and the Facebook page launched on November 7, 2010 (over 630,000 "likes"). All of the social media sites are maintained by a public relations firm, which may explain the low numbers of "likes" and followers.

Reporting on the daily activities on the monarchy is not new; George III started the practice in 1803, but Queen Elizabeth was an early adopter of technology. In 1976, before the Internet was commonly used, she sent her first e-mail using a British Army computer. The use of social media by the monarchy, while creating new levels of protocol, is designed to not only communicate with the broad public, but also to help manage perception and create engagement by answering questions and testing ideas. The ultimate goal is to increase confidence in the royal family.

Scandals have marred that attempt. In 1980, Prince Philip was the victim of a hacking controversy when two journalists gained access to his e-mail account. More recently, in September 2012, Prince Harry learned the dangers of allowing cell phone cameras too close when he was photographed naked during a Las Vegas vacation. The women who had been invited to his suite to play strip poker allegedly took the pictures with their cell phones and then sold them to the TMZ Web site. While British journalists were asked not to print the pictures, Rupert Murdoch's *Sun* decided that it would because the pictures had already been distributed on the Internet. Following the Vegas scandal, Prince Harry deleted his personal 400-friend Facebook page that was maintained under the pseudonym Spike Wells. Prince Harry, like other royals, is a member of the millennial generation, which is well connected via social media. Such issues reflect the reason that official social media channels tend to be well controlled and limited in the type of information that is disseminated. However, as Queen Rania has shown, social media can be useful for monarchies as a tool for advocacy.

Morozov Principle

Based on the writings of academic and frequent media commentator Evgeny Morozov, the Morozov principle encapsulates the necessity of examining both the advantages and disadvantages of the political role of social media, particularly in the context of prodemocracy movements that aim to destabilize authoritarian states. The Morozov principle operates in response to the flurry of optimism that frequently accompanies accounts of social media's role in various political contexts—including the 2009 Moldova and Iranian protests and the 2011 uprisings in Tunisia and Egypt (part of the Arab Spring) that were hailed as Twitter and Facebook revolutions in the Western media. Morozov argues that perspectives hinging upon optimistic assumptions about the use of social media that ignore disadvantages must be abandoned to better contextualize the nature of geopolitical conflicts and work toward formulating more effective means of employing technology and aiding local civil society groups in the service of democracy.

Cyberutopianism and Internet-Centrism

Morozov specifies two ways in which many commentators fall prey to privileging the advantageous role of social media for democratization while often entirely ignoring the disadvantageous role. First, "cyberutopianism" refers to "a naïve belief in the emancipatory nature of online communication that rests on a stubborn refusal to acknowledge its downside." Cyberutopianism fails to examine the underlying assumptions that

engender the belief that social media (and the Internet more generally) predominantly offers a wealth of opportunities for democratization—from the ability to find information online that discredits repressive regimes to the ability to coordinate activities and voice dissent within decentralized spaces. Their assumptions tip the scale toward advantages while avoiding consideration of the opportunities that these digital tools offer authoritarian states wishing to maintain their dominance. Morozov remains unconvinced that the Internet is inherently more useful for obtaining the truth about a repressive regime than for the same regime to repackage their propaganda tools and effectively employ them online.

Second, “Internet-centrism” refers to “a philosophy of action” that unquestioningly places the Internet at the forefront of strategies designed to achieve or promote democratization. These approaches are fundamentally flawed because they prioritize “the tool over the environment” and in doing so remain ignorant of “social, cultural, and political subtleties and indeterminacies.” Morozov argues that Cold War triumphalism has prompted and helped to entrench such technologically deterministic perspectives, with many Western leaders and thinkers erroneously elevating the role of information and communication technologies (such as faxes and radio) in the peaceful dissolution of the Soviet Union. This emphasis omits the role of structural factors and political-economic conditions that contributed to the fall of state socialism, instead highlighting technology as the vital, lethal weapon.

Morozov also points out that adherence to cyber-utopian perspectives can be irresponsible, leading to further negative consequences for the citizens of authoritarian states. For example, the *New York Times*’ emphasis on the Obama administration’s request that Twitter delay site maintenance in order to avoid impeding the use of the service by Iranian dissidents likely contributed to the Iranian government’s belief in the power of Twitter and subsequent efforts toward tracking down and arresting online dissidents. Morozov also describes how a *Los Angeles Times* article inadvertently made dissidents visible to Iranian authorities through a description of their appropriation of a social-networking service called Goodreads. Designed for community-building

based on a love of books, Iranians used it to establish a safe(r) space for political discussion.

Social Media and Authoritarian Regimes

The Morozov principle not only emphasizes the need to consider both advantages and disadvantages of social media’s role in politics, but also implores the public to consider whether the negative may outweigh the positive. This leads Morozov to detail the many ways in which authoritarian governments have been effectively using social media and other new technologies to advance their goals and quell attempts by the opposition to build support. Strategies include surveillance activities, counter-insurgency tactics, censorship, and shutting down connectivity (entirely or within strategic regions). Iranian authorities have used Facebook to gather intelligence about the organizational strategies of Iranian activists.

While Iranian activists were praised in Western media for documenting their protests and responses by police, the authorities not only compiled their own documentation but also used the images collected and shared by activists to later ask the public to identify individuals who were then arrested. Attempts to censor information have been used to varying degrees by repressive regimes, but many have recognized the difficulty and even impossibility of preventing the spread of information. In fact, the “Streisand effect” refers to the increased publicity that information can often acquire as an unintended consequence of censorship practices. Instead, Morozov argues that spin is now preferred by many authoritarian states, a concept he calls “spinternet.” For instance, China financially employs citizens to promote ideologically appropriate messages online, opting to engage in online discourses.

Morozov also points out that there is no reason to believe that the Internet is only useful for prodemocracy groups. This point illuminates the complexity of the geopolitical regions that cyber-utopian writers (and Western media in general) too often ignore. Morozov details the existence and in some cases strong persistence of groups who support authoritarian regimes or represent perspectives antithetical to the goals of democratic movements. These groups have equal access to social media tools to coordinate, collaborate, and promote their views, as well as take action against

prodemocracy groups and other dissidents by surveilling their activities and requesting that social media services remove dissident material. Egypt's extremist Muslim Brotherhood, Russia's extreme right-wing Movement Against Illegal Immigration group, and Mexico's criminal gangs all use social media tools to, respectively, campaign for release of fellow extremists, employ Google Maps to root out ethnic minorities, and upload gruesome and violent videos to YouTube to intimidate and reinforce their power. Al Qaeda is another group with a sophisticated online presence, using new media tools to their advantage, yet this disadvantageous side of the social media and politics story is rarely dissected or even mentioned in Western media.

iPod Liberalism

Moreover, the Internet can also be seen as yet another “opiate of the masses,” offering numbing entertainment and distraction that occupies the minds of the public, deterring them from critique and participation in dissident activities. Morozov offers examples of authoritarian governments actively encouraging the use of the Internet as an opiate by, for instance, providing “dedicated servers full of pirated digital goodies” for free download and consumption. From this framework, the availability of social media tools does not entail or enable political consciousness or even the motivation to seek out information about the immorality of their government that is now available to many citizens of authoritarian states. Morozov calls this “iPod liberalism,” and questions why cyberutopianism is accompanied by the assumption that all people who own a particular technology are likely to share liberal values. In the same vein, cyberactivism is commonly heralded in Western media, but cyberhedonism is rarely emphasized. Many Internet users may become “digital captives,” downloading pornography and playing World of Warcraft, or simply use the Internet for a variety of benign, social motivations, instead of actively seeking out critical information and activist groups to join.

The Morozov principle incorporates both positive and negative political uses of social media, and in doing so does not conclude that all efforts toward digital democracy be aborted. Instead, Morozov aims to improve these efforts through a cyber-realist approach that incorporates wider

contextual factors relating to the particular social, cultural, political, and economic circumstances of each geopolitical region while seeking to empower dissident groups on the ground.

Mosireen.org

Mosireen is an Egyptian media collective with a presence in multiple social media outlets. The group's name is a combination of the Arabic words for “determination” and “Egypt.” It was formed during the 2011 Egyptian uprising, and used footage gathered by citizen journalists to counter propaganda from state-run media. The group continued to provide a critical perspective during the rule of the interim military government, and it posted content critical of the current government, which is dominated by the Muslim Brotherhood. Four activists founded the organization during the Egyptian revolution. As described by their Web site, the collective was “born out of the explosion of citizen media and cultural activism in Egypt during the revolution,” and aims at “wrong-footing censorship and empowering the voice of a street-level perspective.”

After the fall of President Hosni Mubarak, the Mosireen media collective continued to promote the collection of footage related to the 2011 revolution and to the ongoing abuse of power by military forces. This woman was setting up a video camera in order to record the testimony of victims of torture by Egypt's Mubarak regime on November 17, 2011, in a Mosireen workspace near Cairo, Egypt.

In January 2011, thousands of Egyptians gathered in Tahrir Square to protest against political oppression and economic stagnation. In February 2011, after weeks of violent clashes between police and protesters, President Hosni Mubarak announced that he would step down after 30 years in power.

The founders of Mosireen were initially involved with the Tahrir Square media tent; during the January 2011 protests, the tent served as a hub where activists could bring video footage of government attacks on protesters and have it quickly edited and uploaded to an online archive.

After Mubarak stepped down, Mosireen continued its activism; as its Web site notes, "Egypt's march toward the future its millions demanded did not end with Mubarak leaving power, it began." In accordance with this, the organization posted critical videos during both the rule of the interim military government, from February 2011

to July 2012, as well as the Muslim Brotherhood-dominated government of President Mohamed Morsi, who took office in July 2012.

The group functions as a media collective, and according to its Web site, focuses on "supporting citizen media of all kind." It operates on the principle of crowdsourcing; it does not employ professional journalists, but instead relies on footage from amateur activists, often taken using smartphones. To this end, the group maintains a collective space in downtown Cairo, with sound, lighting, and editing equipment; citizen journalists are welcome to use the facility to create or edit videos for upload. Mosireen also runs a program to train potential citizen journalists; the program operates on a pay-what-you-can basis.

During the protests to overthrow Mubarak, the four founders of Mosireen concentrated on gathering footage of government brutality against protesters and disseminating it both inside and

outside of Egypt. In an interview, Salma Said, one of the founders, noted that in the aftermath of the revolution, the group decided to continue its efforts to ensure that the post-Mubarak regime followed through on its promises to implement a more democratic government. In accordance with this, during the nearly 17 months of military rule under the transitional government, Mosireen continued to upload footage documenting army abuses of power, including a massacre of Coptic Christians and an attack on activists engaging in a sit-in outside of Parliament. In addition, while filming, Said was shot with bird shot by the police; when the interior minister denied that the police ever fired upon unarmed citizens, Mosireen posted footage of Said discussing her injuries, as well as x-rays from her hospital visit.

In the months leading up to the one-year anniversary of the revolution, Mosireen launched the Tahrir Cinema initiative; here, the group set up film screenings in Tahrir Square, showing footage from the 2011 protests. The aim was to remind viewers of the goals of the revolution and to fight political apathy. The group also helped individuals set up street screenings of the footage; Said estimated that Mosireen distributed 10 to 20 DVDs of the footage each day for nearly two months, allowing individuals to host private screening in their homes.

Since July 2013, Mosireen has been highly critical of the elected government of Mohamed Morsi. Mosireen's main Web site contains a section titled "Know Their Constitution"; it features videos critical of the new constitution that were written by the Muslim Brotherhood, and urges viewers not to support it. In addition, on its YouTube page, Mosireen posted multiple videos highlighting the Morsi government's corruption and abuses of civil rights. The page also features videos focused on Morsi's failure to deal with basic public service issues, such as the garbage problem in Egypt.

Mosireen maintains a Web site that contains information about the group's mission, political activities, and educational opportunities. It also has a Twitter account with 49,000 followers, and Said maintains a separate Twitter account that has nearly 99,000 followers. Mosireen has a Flickr account to post photos, and a Facebook page with more than 11,000 "likes." Its main Web platform, however, is its YouTube page. Within three months

of uploading videos to the site, Mosireen became the most watched nonprofit channel inside of Egypt. As of May 2013, Mosireen had uploaded 255 videos to the site. One of its most popular videos is *Victory to the Martyrs*; the 10-minute film contains footage compiled by hundreds of activists, and documents the killing of protesters between January and November 2011. The film had garnered more than 118,000 views by 2013.

The group has also relied on social media to raise funds for its activities and training programs. In 2012, using the Web site Indiegogo, the group managed to raised more than \$40,000 to support its operations. This use of crowdfunding, soliciting many small donations of no more than \$1,000, has allowed Mosireen to retain its editorial independence and turn down funding from nongovernmental organizations and the Egyptian government.

MoveOn Effect, The

The MoveOn Effect is the title of a book authored by David Karpf and published by Oxford University Press in 2012 (the full title is *The MoveOn Effect: The Unexpected Transformation of American Political Advocacy*). The term refers not to the direct effectiveness of MoveOn.org, but to the indirect effect of netroots-driven innovations on the broader ecology of the political advocacy

system. In particular, the MoveOn effect is found in two trends: changes in organizational membership regimes, and changes in organizational fundraising regimes. These two changes, in turn, give rise to a generational shift in organizational structures, networks, and tactics, while simultaneously disrupting longstanding advocacy organizations. The central argument is that these second-order effects have a larger impact on political activism than the direct affordances offered by individual social media tools. Rather than organizing without organizations, the MoveOn effect implies that the Internet's greater impact is through organizing with different organizations.

Membership Regimes

Organizational membership regimes change in response to available communications technologies. In the 1970s, the decreased costs of database management brought about by revolutions in mainframe computing allowed nonprofit civil society organizations to redefine membership from face-to-face participation to check-writing by mail. In prior decades, membership was defined through large, federated membership structures. To be a member of the Rotary Club, the Elks Club, or the Sierra Club meant attending local meetings, building strong social ties, and developing an identity as a "Rotarian," an "Elk," or a "Sierran." These strong ties had many social benefits, but they also demanded substantial time commitments from members and substantial support resources from the organization. With the rise of direct-mail fundraising, organizations were instead able to connect with supporters individually without that local infrastructure. In exchange for a calendar, a magazine, or some other participatory incentives, organizations built their ranks of "armchair activists" who participated by mail but did little else. This innovation enabled the "interest group explosion" of the 1970s, giving rise to a wave of single-issue, professionally managed advocacy groups based in Washington, D.C.

Beginning in 1998, MoveOn.org redefined membership a second time, from check-writing to online membership. While check-writing members are sometimes disparagingly called "armchair activists," Internet-based members are sometimes disparagingly labeled "clicktivists." Interestingly, many of these members do not even realize that

they merit the term. Membership has been redefined by the organization, not by the members. Any recipient of MoveOn.org's e-mail messages (or virtually any other "netroots" organization's) is classified a member, whether they provided a donation, took regular actions (online or offline), or simply clicked once on an e-petition.

Both of these changes in membership regimes are rooted in technological affordances. The previous medium of direct mail allowed organizations to "prospect" far and wide for small donors. Each additional piece of direct mail carries a marginal cost, though (stamps, physical paper, and printing). The marginal cost of physical mail creates an incentive for single-issue organizations with member lists made up of supporters who are likely to donate. Membership has to be tied to donations so that an organization does not go broke through member communications.

The marginal costs of e-mail, by comparison, are approximately zero. The cost of adding one additional person to an e-mail distribution list (10,000 recipients versus 10,001) is nonexistent. The lack of marginal costs for online communication creates an incentive for the development of multi-issue organizations with member lists made up of all individuals who might donate their money or time under some circumstances. This redefinition of membership is central to all other elements of the MoveOn effect. Altering the relationship between an organization and its member-stakeholders creates ripples in how an organization builds a stable funding base, what issues it works on, and how it works on those issues.

Netroots organizations take a "sedimentary" approach to building a broad membership. Typically, they focus on high-profile issue campaigns, offering a productive outlet for partisan outrage over the latest political controversy. Timely appeals are more likely to "go viral," spreading beyond the most frequent participants to their broader peer networks. Once the controversy ends, the organization is left with a list of new member/supporters as a sedimentary residue of sorts.

Fundraising Regimes

Organized advocacy groups require stable revenue streams in order to plan and execute long-term strategic information and influence campaigns. In rejecting the direct-mail model of

membership through small donations, the “netroots” generation of advocacy organizations must identify replacement funding mechanisms. MoveOn.org again acted as the innovator in this area, and peer organizations have followed suit. In the area of fundraising, the MoveOn effect consists of a transition from annual general-use member donations to rapid-response, targeted online member donations. This fundraising transition advantages novel tactical repertoires and organizational structures.

A central feature of targeted online fundraising is headline chasing. Unlike direct mail funding appeals, which must be planned weeks in advance and therefore cannot be tied to the current news cycle, online funding and action appeals can be tied to the issue of the moment. The timeliness of the medium enables more specific action requests—commonly, MoveOn will develop a campaign commercial capitalizing on the latest news controversy, inviting supporters to watch the commercial and donate \$10 to help put it on the air. The specificity and timeliness of these appeals allow for far more effective fundraising. Netroots organizations like MoveOn have been known to raise \$500,000 or more around a timely tactic in a single day.

Headline chasing is particularly well suited to the daily churn of the social media landscape. News cycles move faster in the social media age than they did in the broadcast or cable news eras. This is a function of the “news hole,” the amount of time and space that news operations fill daily. When news occupied 30 evening minutes per day, along with the morning paper and the news weeklies, stories moved slowly. Now that news is disseminated and dissected through blogs, Twitter, and Facebook (with the active participation of news organizations), controversies flow more quickly through the system. This is one advantage that netroots organizations have over their legacy peer organizations: Having been built around e-mail and Web-based communication, they are better situated to leverage the technological affordances of those systems.

A second benefit of the change in fundraising regimes is that it forces organizations to play closer attention to the actual interests of members. Groups like MoveOn have developed sophisticated mechanisms for obtaining “passive democratic feedback.” One such mechanism is

A/B testing of e-mail messages. The organization sends out multiple test versions of an e-mail to randomized segments of its member list. By tracking e-mail open rates, e-mail clickthrough rates, donation rates, and action rates, the organization is able to determine the issue topics, issue frames, and action requests that its membership prefers. Since success in online fundraising is a direct function of message popularity, these netroots organizations cannot stray too far from the will of the membership. A direct-mail-funded organization has much more leeway to ignore member sentiment and act on the preferences of staff and patron donors. A targeted online-funded organization has weaker ties to its small donor-supporters, but also cultivates much richer member communication practices.

The drawback of headline chasing is that its rapid-response nature can crowd out longer-term organizational priorities. Targeted online fundraising works best when focused on the day’s headlines, and when devoted to specialized tactics like television commercials. Online fundraising for volunteer training events, deliberative processes, office space, or community organizer salaries is far less successful. Whereas direct mail fundraising provides general revenue that could be turned to any organizational goal, the targeted nature of most online fundraising restricts the uses of those dollars can be applied to—if you fundraise for a commercial, you are required to spend that money on the commercial. In the absence of additional revenue streams—either through patron donors, foundations, government grants, or merchandising—advocacy organizations run the risk of over-reliance on short-term actions that feed on controversy, without moving toward broader strategic goals.

Partisan Orientation

The MoveOn effect is found almost entirely among organizations in the Progressive/Democratic party coalition in the United States. Across the globe, MoveOn-like organizations have appeared internationally (Avaaz.org) and in a number of countries (38Degrees.org.uk and getup.org.au). These global organizations are also left-aligned. Conservative advocacy leaders have frequently attempted to build equivalent organizations, but have consistently failed in doing so. There are multiple

competing theoretical explanations for this partisan divide. One theory, “ideological congruence,” argues that there is something inherently horizontal/progressive about the end-to-end architecture of the Internet. Another theory, “outparty innovation incentives,” mutes the power of ideology, and instead argues that the party out of power has a range of positive incentives encouraging the adoption of new technologies and experimentation with new organizational forms. In essence, the “team” that is losing in domestic politics is more likely to “fire the coaches” and try something new. A third theory, augmenting the other two, “merry pranksters” holds that the low transaction costs of online communication allow large partisan groups to disrupt the institutional development of opposing competitors during their formative stages.

In all likelihood, each of these theories is partially correct. In *The MoveOn Effect*, Karpf argues that the strongest evidence is in favor of the outparty innovation incentives explanation. Advocacy organizations traditionally gain membership when the opposing party holds power. Major donor networks look to redirect their spending in response to electoral failures. Talented campaign staffers who, if victorious, would have taken jobs in the administration, instead look for alternate opportunities. It is simpler to mobilize partisan outrage to stop programmatic changes to the status quo than it is to organize support for the long, messy process of achieving new policy victories. This argument holds that, had Al Gore claimed the presidency in 2000, MoveOn.org would have lacked the circumstances that let it develop a mass membership. Conservative peer organizations, on the other hand, would have had ample organizing opportunities, producing a far different complexion for the online advocacy universe today. It is also noteworthy that international and cross-national equivalents of MoveOn have all been launched under outparty circumstances, and with advice and training from MoveOn alumni.

Disruption and the Loss of Beneficial Inefficiencies

The MoveOn effect holds the promise of new opportunities for organizations, members, and social movement tactics. It sounds a foreboding tone for longstanding advocacy organizations,

however. The shift in fundraising regimes advantages virtually networked organizations with few staff and slim office space. Organizations founded during the direct-mail era built up large staff and physical resources, and this remains a comparative advantage for such organizations. They have organizers, lobbyists, and policy experts that the new groups do not have and cannot support through targeted online fundraising. This is a cause for concern. Online communication is more efficient than older communications media, but the inefficiency of those media offered some benefits. As civil society organizations adapt to the new membership and fundraising practices of the Internet age, there is reason to worry that a few important social functions will be unintentionally lost.

MoveOn.org

MoveOn.org is an Internet-mediated political advocacy organization. Founded in 1998 by software entrepreneurs Wes Boyd and Joan Blades, the organization is credited with multiple substantial innovations within the realm of online politics. With over 7 million members, MoveOn is one of the largest advocacy groups in contemporary American politics. During the Bush administration, the group became a central organizing point

for antiwar protests. It also pioneered a new repertoire of responsive issue-based organizing, mobilizing online membership in reaction to Bush administration policy priorities. Former staff have played key roles in launching similar organizations, both nationally (ColorofChange.org, MomsRising.org) and internationally (Avaaz.org, 38Degrees.org.uk, getup.org.au). The group remains iconic among online political advocacy experts.

History

MoveOn began as an online petition in response to the Clinton impeachment hearings. Boyd and Blades, a married couple, launched a Web site with an online petition urging congress to “censure Clinton and move on.” The petition went viral, eventually attracting 500,000 signatures. After these signatures failed to persuade Congress, Boyd and Blades extended their efforts to citizen lobbying and other pressure tactics, treating all of the petition signers as though they were members. The new organization attracted substantial media attention in these early days, primarily as evidence of the Internet’s nascent impact on American politics. Though online petitions existed elsewhere, MoveOn’s practice of treating petition signers as members was new. The small staff and low overhead costs meant that MoveOn could develop as a new organization, rather than dissipate after the initial reason for organizing had ended.

Indeed, through the remainder of the Clinton Presidency, MoveOn remained a relatively small part of the organized American left. During the Bush presidency, MoveOn’s membership grew substantially. In the aftermath of September 11, 2001, recent college graduate Eli Pariser launched a Web site calling for a peaceful response to the attacks. That petition also went viral, and Boyd and Blades invited Pariser to join their organization and merge the lists. From there, MoveOn went on to serve as the mainstream hub of the burgeoning peace movement. Pariser became the organization’s second executive director in 2004. Throughout this time period, MoveOn’s membership swelled to 3.2 million people. Its online membership reacted swiftly, not only to antiwar messages, but also to a wide variety of progressive issues. Those members took action offline and online. MoveOn thus became a central actor among progressive advocacy organizations,

adding its substantial outreach capacity to a host of issues as they ripened on the political/media agenda.

In June 2003, six months before the Iowa caucuses, MoveOn held an “online primary” to determine whether and who to endorse. Howard Dean received a plurality of votes, but failed to cross the 50 percent threshold, thus the organization withheld its official endorsement. The MoveOn primary captured significant news attention, serving as an early measure of Democratic partisan enthusiasm in the lean-news months before the primaries. The organization spent over \$20 million in that election, mostly raised through online contributions from small donors.

In the 2008 election, MoveOn members donated \$88 million to help elect President Barack Obama. MoveOn endorsed Obama in the days prior to the “Super Tuesday” primary elections—much earlier than most other advocacy group endorsements. Nearly 1 million MoveOn members also devoted over 20 million hours to helping elect the president in that cycle. MoveOn’s robust electoral work spurred further membership growth. The organization then diverted its energies toward supporting major progressive policy priorities, including an initiative titled “The Other 98 Percent” that took on the same problems of economic disparity that inspired the Occupy Wall Street movement one year later.

Noteworthy Innovations

MoveOn’s largest innovations come in the areas of membership relations, fund-raising, and organizational structure. These have been emulated by a host of other online advocacy groups. MoveOn successfully redefined membership from check-writing to online engagement. It demonstrated that engaged online member support could rapidly translate into massive, reliable fundraising for targeted efforts. It also borrowed a practice of “radical decentralization” from Boyd and Blades’s former tech firm. The organization has a few dozen staff and no office. These low overhead costs keep the organization nimble and responsive.

MoveOn has been a pioneer in e-mail-based activism. It remains primarily an e-mail-driven organization, with intentionally less engagement on social media platforms like Facebook and Twitter. The organization uses A/B testing of e-mails to

identify popular issue topics, frames, and action requests among its membership. The “culture of testing” they have developed is taught to other advocacy groups through a series of workshops offered via the New Organizing Institute.

In 2004, MoveOn launched the first-ever user-generated ad contest. Titled “Bush in 30 Seconds,” it allowed MoveOn members to develop, submit, and vote on commercials. The winning commercial was then aired on national television. Controversy around overly harsh language in two of the unselected commercials dampened enthusiasm for this tactic and demonstrated that high-profile user-generated content required active filtering and clear rules and norms. MoveOn held a similar contest in the 2008 election cycle.

The organization also pioneered online–offline event management tools, including the successful spread of MoveOn “house parties” and “Bake Back America” fundraiser bake sales in the 2004 election cycle. MoveOn has partnered with documentarian Michael Moore to promote attendance to his films, planning online–offline film events as well. MoveOn has also partnered with celebrities and comedians to produce commercials and viral videos around election cycles.

In 2011, MoveOn launched SignOn.org, a hosting service for Internet petitions. Similar in structure to Change.org and PetitionOnline.com, SignOn allows any MoveOn member to create and circulate a petition. High-traffic petitions can then be elevated to the entire national membership, creating a bottom-up mechanism for issue selection and exposure. MoveOn’s staff structure includes a “MoveOn Labs” section that works to develop innovations of this sort.

Criticism

Criticism of the organization has come from three directions. Conservative critics hold that MoveOn is part of the radical left, labeling the organization as socialist or as a George Soros front group. Soros donated to the organization’s 2004 electoral efforts. After that election, they ceased accepting donations from Soros and other major donors. Radical leftist critics charge that MoveOn cheapens left-wing activism by reducing it to “clicktivism,” and introducing marketing concepts into protest movements that would otherwise be anticonsumerist in nature.

Interest group critics, meanwhile, laud MoveOn for its rapid-response activism, but also worry that the organization’s niche leaves little room for longer-term community organizing efforts. This brand of critique is less concerned with MoveOn’s activities than with the broader organizational ecology of social movement organizations in the digital age. MoveOn.org is emblematic of some of the best practices in online advocacy, but its organizational limitations also point to some of the possible broader limitations of 21st-century social movements.

Multiple Leveraging

The term *multiple leveraging* refers to the coordinated use of multiple forms of social media to increase one’s ability to engage and influence

people online. The goal of multiple leveraging is to increase online presence and influence by delivering content to as many people as possible, and in turn, motivating political support or action. This goal is commonly accomplished through social media as content that is shared through one channel, such as a Facebook post, and can easily be forwarded within that medium (through “shares” and “likes”) as well as repackaged and disseminated in various forms through other social media such as Twitter, Web sites, or blogs. Thus, a fine-tuned social media strategy can leverage multiple forms of social media in order to maximize the reach and effectiveness of political content.

There are numerous Internet-based social media that can be leveraged together. Facebook, the dominant social networking site; and Twitter, the most popular microblogging site, have become standard elements in social media strategies, along with YouTube, the Internet’s most popular video sharing site. Multiple leveraging can also include disseminating information through a blog, targeted Web advertising, and e-mail lists. It is increasingly important to also leverage more visual ways of packaging content such as Flickr, Tumblr, Pinterest, and Instagram, and video sites like YouTube. In addition, many political groups simultaneously leverage any number of social-networking sites across the globe that target specific subsets of the population (such as migeste.com, designed for Latinos; and blackplanet.com, targeting African Americans). Additionally, there are a growing number of popular social-networking sites that are heavily used in particular geographic regions (e.g., RenRen, QZone, and Sina Weibo in China; Badoo in Europe; and Cyworld in South Korea), which can be effectively incorporated into international social media leveraging strategies. Finally, political organizations are interested in mobilizing people on the ground, so leveraging social networking sites like Foursquare and Meetup.com that involve the locations and activities of users is becoming central to bringing like-minded people together offline to coordinate political activity.

Strategies

The goals of multiple leveraging are not new; however, the strategies used to accomplish these goals are unique to the evolving social media landscape. Political communication goals have remained

relatively steady throughout the last several centuries, as politicians and political organizations have tried to reach the same types of broad or targeted political communication goals. Broad political communication is the simultaneous broadcasting of political messages to large numbers of people or groups. This would include activities aimed at creating and disseminating information and attempting to influence the political agenda. Targeted political communication is the delivery of specialized messages directed at particular individuals or members of groups asking for some type of political action. Targeted political communication can include efforts to recruit supporters to join an interest group or campaign, raise money and resources, and/or mobilize political action.

While these goals have remained consistent, the strategies used by political actors to achieve them have become much more sophisticated with the advent of multiple new information and communication technologies (ICTs) and the innovative use of these political communication tools. Social media is the latest and most sophisticated addition to the tool kit that political actors and organizations can use toward these long-held goals. Multiple leveraging refers to using as many of these tools as cohesively as possible to reach as large an audience as possible and achieve broad and targeted political communication goals. It is used to maximize the synergistic nature of social media content and exponentially increase the online influence of political actors. There are hundreds of articles, blog posts, and Web sites that offer tips on how to leverage content most effectively. Most suggest having a centralized source of information, generally a Web page, more narrowly designed microsite, or blog with easy-to-share information, images, and video. In order to use multiple leveraging to increase online presence and influence, an organization, campaign, or politician must regularly provide new interesting content that can be shared.

2008 Presidential Campaign

The best example of strategically leveraging multiple social media platforms for political purposes was the online campaign of Barack Obama in 2008. While it was far from the first Internet campaign, the Obama campaign integrated social networking into its entire Web strategy, linking online

networks to offline campaign activity by leveraging multiple social networking sites together. Meanwhile, the campaign maintained the Web site my.barackobama.com (or “My BO”), a centralized source of information that doubled as a fully integrated social-networking and political-action site. As with other social networking sites, users could personalize this site by creating profiles, posting pictures, and writing blogs, and they were given the tools to take political action, such as making campaign calls from home and creating personal fundraising pages. The Obama campaign set a new benchmark for successfully leveraging multiple social media, and these methods were quickly adopted by major political organizations and campaigns to compete in the current social media landscape.

Measurement

One constant challenge of maintaining a cohesive and effective social media strategy is determining how much leverage or influence one gains through current strategies. It is not enough to simply identify how many people might view a particular message by counting Facebook friends or Twitter followers, for instance. These numerical measurements merely quantify how many people may see a message, rather than clarify what types of messages are most effective, or how political content did or did not precipitate a change in political attitudes or motivate action.

There are a growing number of companies offering services designed to measure, increase, and effectively utilize online influence. Among these various companies, Klout is arguably the most sophisticated and by far the most popular. Klout provides users with a Klout score, a number from one to 100 that represents the aggregation of multiple pieces of data, or signals, about a person's social network activity. These signals include any online action taken in response to Web content that is created or shared.

Currently Klout's model incorporates information from over 400 signals, derived from seven different social sites. It can be used to not only determine how successful current efforts to leverage multiple social media tools are, but also to provide concrete measurements of individual pieces of content. For instance, most observers of the 2012 presidential election would agree that

the Obama campaign built on its dominance in 2008, and used social media more effectively than the Romney campaign. But how dominant was the Obama campaign? A quick look at Klout shows that on Election Day, Obama's Klout score was 99 out of 100, the highest score at that time, compared with 92 for Romney. Furthermore, Mitt Romney's most effective piece of content was a tweet that engaged over 15,000 people, while Barack Obama's most effective piece of content was a photo that engaged over 750,000 people through many different social media sites, 50 times as many people as the Romney tweet.

Musicians and Social Media in Politics

With the rise of social media, musicians have increasingly come to use these platforms as strategic tools for political activism. In the presidential elections of 2008 and 2012, musical celebrities from nearly all popular genres used social media to express political beliefs about campaigns, and more importantly, to endorse presidential and vice presidential candidates. A prominent example of endorsement is hip-hop mogul Jay-Z's support of Barack Obama on YouTube in the 2012 presidential election.

Along with creating three videos supporting the 2008 Barack Obama campaign, which were distributed on YouTube, rapper Jay-Z also hosted this rally for the candidate in Philadelphia, Pennsylvania, on November 3, 2008, the day before the election. Also in attendance at the rally were fellow musicians and singers Mary J. Blige, P. Diddy, and Jay-Z's wife, Beyoncé.

In addition to YouTube, platforms such as Facebook, Flickr, and Twitter have been broadly used to promote candidates and celebrate victories, representing the most recent iteration of popular musicians' traditional role as disseminators of political ideology and modelers of civic engagement, especially among younger audiences. Even during nonelection years, musicians continue to use social media to express their opinions across the political spectrum, from conservative musician Ted Nugent on Twitter to liberal alternative rock band Cake on Facebook, and there are significant economic consequences for these musicians who take sides in contentious political disputes. Beyond elections, the subjects addressed by politically engaged musicians on social media run the gamut from health care reform to fiscal policy.

Proactive campaign-oriented examples of social activism by musicians include Rock the Vote, Rap the Vote, and Tweet the Vote, the last of which occurs entirely via social media. A non-partisan, nonprofit organization, Rock the Vote

was conceived in the United States over 20 years ago when a Virgin Records executive teamed with an electoral campaign worker who was also experienced in political fundraising. It was founded in response to perceived threats to freedom of speech and political expression among major label artists, and as part of a broader plan to politically engage younger citizens by using the promotional power of the entertainment industry. It quickly established itself as an important organization, helping younger audiences connect politics and popular culture. To date, Rock the Vote has registered more than 5 million young people to vote.

The Rock the Vote organization has employed social media in a variety of contexts, including the 2010 Tweet the Vote Campaign, which partnered with musicians including Faith Hill, Tim McGraw, Maroon 5, and Pink. These musicians tweeted during the midterm elections that year, directing eligible young voters to a Web page on which they could register to vote. This social media campaign generated over nine million impressions in the

course of the election cycle. Rock the Vote and its affiliate organization Rap the Vote have also employed social media via specialized Twitter hashtags, specifically targeting black and urban youth for political engagement. Musicians such as Akon participated in Rap the Vote during the 2012 presidential election cycle, appearing in its YouTube videos recorded throughout the Atlanta Metropolitan Area, which were then shared as content to users of Facebook and Myspace. Rock the Vote, Tweet the Vote, and Rap the Vote have all been covered in MTV's broadcast and interactive channels. Rock the Vote has also employed a variety of additional social media platforms, including YouTube, Myspace, Facebook, and even Flickr.

In 2012, Rock the Vote expanded its social media initiative to mobile devices with its Scan to Vote campaign. In recognition of the growing popularity and influence of mobile applications, the organization's new campaign involved designing and dispensing t-shirts that were embroidered with QR codes, devised as part of a youth voter registration drive. Shirt wearers functioned as voter registration hotspots, directing voters' smartphones to a Rock the Vote Web site, where they were able to register to vote via the mobile Web. To help spread the word, Rock the Vote encouraged supporters to send tweets using the #scantovote hashtag. Musicians who used this new hashtag in their tweets included Christina Aguilera, Maroon 5, Neon Trees, and major labels Def Jam Records, Mercury Records, and Island Records. The campaign began in April of that election year, with Aguilera's use of the hashtag in her tweets regarding the annual House Budget announcements in Washington, D.C.

Reactive examples of musicians' social activism often come in the form of demonstrations and protests. Historically, these have included John Lennon and Yoko Ono's War is Over campaign, and Bob Dylan's performance at the 1963 March on Washington. John Lennon and Yoko Ono's social activism included writing an antiwar anthem, released during the 1971 holiday season, titled "Happy Xmas." The song, which featured the Harlem Community Choir, was the culmination of more than two years of peace activism undertaken by Lennon and Ono. This activism entailed a larger, transnational multimedia campaign that

also involved renting billboard space in a dozen global cities positioning war (and peace) as a choice made by citizens, rather than by governments. This strategic coordination of Lennon and Ono's images, text, and music, deployed across a range of mass media platforms, was the direct antecedent of today's social media music activism.

A more recent example of reactive social activism by musicians is Occupy Musicians, a group affiliated with the Occupy Wall Street movement beginning in 2011. Musicians including Lou Reed, John Zorn, Talib Kweli, Tom Morello, Ian MacKaye, Joan Baez, and Saul Williams participated in the demonstrations. Occupy Musicians enabled such contributions by creating a Web site that served as a space to organize performances at Occupy Musicians events, host songs and music videos, and connect musicians to Occupy Musicians locations and fundraisers. Occupy Musicians also created a Twitter handle and a Facebook page, and live performances of songs at protests were shared, both officially and unofficially, via social media such as Vimeo and YouTube. Media organizations such as Village Voice Media, Huffington Post, and *Politico* also helped to promote this content. Musician and activist Stephen Said was central to this process after he was called upon by the Occupy Musicians movement in its first week to help bring artists to the movement's Zuccotti Park headquarters near Wall Street, and to develop its social media strategy, as well as the movement's music distribution arms, Occupy Records and Occupy Music. The Occupy Wall Street movement and Occupy Music also developed an Occupy Musicians Solidarity Council, and Occupy Music Education, both of which had prescriptive advice for political action that was distributed via social-media platforms such as Facebook and Twitter.

History of Campaign-Oriented Musical Activism

Campaign-oriented social activism by American musicians dates back at least to the presidential election of 1840. "Tippecanoe and Tyler Too" was the campaign song for Whig party candidate William Henry Harrison and running mate John Tyler that election cycle. Harrison was known as Old Tippecanoe for an early career military victory over a Native American chief

at the Battle of Tippecanoe of 1811. Harrison's nom de guerre re-emerged in his 1840 presidential campaign song. The song, which set lyrics by Alexander Coffman Ross to a popular minstrel melody, was witty and catchy, and became widely popular. It played a role in convincing a majority of voters to elect Harrison to the presidency. Harrison's "Tippecanoe and Tyler Too" campaign song represented the first stirrings of modern campaigning, complete with the dynamics of political spectacle, multimedia branding, spin, and hyperbole. These elements have continued to play a key role in more recent national and international political campaigns as mass media and then social media have become dominant channels for information sharing.

2000 Presidential Campaigns

The rock band Rage Against the Machine performed a protest concert outside the doors of the 2000 Democratic National Convention in Los Angeles, California. By holding the concert in that location, the band aimed to express its discontent with the two-party political system in the United States. In anticipation of unrest and violence, the band and concert attendees were met by heightened security measures from the Los Angeles Police Department, which arrived armed with riot gear. At the time, these extreme measures at a protest event evoked the recent chaos and social unrest of the Seattle 1999 WTO Protests. Recorded footage of the protest at the Rage Against the Machine DNC concert was featured online, along with a widely viewed MTV News report on the incident. The online coverage was included as a supplement in one of the band's live concert performance DVDs. The protest event was extensively promoted and discussed in online chat rooms, many of which focused on contemporary music, radical politics, social activism, and counterculture issues.

2004 Presidential Campaigns

In the 2004 presidential election cycle, Bruce Springsteen and REM teamed to headline a Vote for Change tour, aimed at electing Democratic candidate John Kerry as president. Tour organizers, working with the DNC, intended to help promote the Kerry vote in key swing states that were identified by the campaign's political strategists

that year. Their political intentions were two-fold. First, they hoped the Vote for Change tour would encourage Democrats in these swing states to make it to the polls and vote. Second, the political strategists of the Kerry campaign were ambitious enough to attempt to reach out to Republican fans of Springsteen and REM in these swing states, where they hoped the artists' pro-Kerry messages in the Vote for Change tour would help influence them to vote for Kerry, rather than for Republican incumbent George W. Bush. Employing social media as a political tool was a vital element in the Kerry campaign strategists' plan. At that time, Myspace was the dominant social platform for music-related activism, and the Vote for Change tour was featured on Springsteen and REM's artist pages on that site. Springsteen and REM's fans and friends on Myspace received updates on tour dates, and were able to comment on recent developments posted as related to the tours and support of Kerry's campaign. The multistate tour had representation on Myspace, with an account that gave information about and linked to Kerry's campaign, Springsteen and REM's artist data, and details of planned concerts.

2008 Presidential Campaigns

During the 2008 presidential election, three videos featuring Jay-Z's political activism and support for the Democratic Party candidate Barack Obama were distributed online via YouTube by the campaign's social media team, and soon went viral. The first video featured footage of Jay-Z's poem about the legacy of African American leaders and activists, including Rosa Parks, Dr. Martin Luther King Jr., and Obama. The second video posted by the Obama campaign featured a segment of Obama using a hand gesture that Jay-Z had made famous in the music video and lyrics to his song "Dirt off Your Shoulders," in order to show his lack of concern about Republican critics. The third YouTube video that Jay-Z starred in for the Obama campaign provided a detailed briefing on voter-ID rules for Michigan voters. This video, like the others, was specifically intended to mobilize the youth, urban, and minority vote. As a result of these videos and other endeavors, the Obama campaign was widely recognized for its novel and aggressive use of new social media platforms as a low-cost method of targeted messaging, in contrast

to more traditional mass media and direct media approaches used by rivals and earlier campaigns.

Rage Against the Machine attempted to hold protest concerts twice in Minnesota during the 2008 Republican National Convention. In an echo of the band's reception at the 2000 DNC, it was met in St. Paul by police equipped with riot gear. Band member Tom Morello told an interviewer that his band was threatened with arrest by the authorities if they approached the stage. Morello's description of the proceedings was then shared via social media such as Twitter by the interviewer. Other details of the event's proceedings were shared by first-hand witnesses via social-media platforms such as Facebook and Myspace. The band played a full protest concert in Minneapolis on the following day, which was followed by political demonstrations. More than 100 demonstrators were arrested as police equipped with riot gear thwarted the gathering outside the arena where the protest concert was held. Details and photos of the post-concert demonstrations were covered and shared on Facebook, Myspace, and YouTube. In the 2012 election cycle that would follow, the GOP's use of social media in its presidential campaign was marked by an abrupt change from musician-based protest of the party.

2012 Presidential Campaigns

Jay-Z made another YouTube video for the Obama campaign during the height of the 2012 presidential election cycle. The video posted to YouTube by the Obama campaign was more conservative in its presentation, featuring the hip-hop recording artist sitting down in a suit and tie advocating for Obama's re-election. Additional supporters of Obama in 2012 included pop singers Katy Perry and Lady Gaga, who tweeted messages of support for the campaign throughout the election cycle. Perry also sang at Obama rallies in Wisconsin, Nevada, and California. After Obama's victory was announced on election night, musicians such as Perry and Lady Gaga continued to proclaim their affiliations with the campaign by tweeting congratulations and expressing their satisfaction. These messages were retweeted by some of their thousands of followers and shared on other social media.

Kid Rock supported Republican presidential candidate Mitt Romney during the 2012 election

cycle by performing at a number of his rallies in key swing states toward the end of the campaign. His Facebook and Twitter accounts were also employed to support the Romney-Ryan campaign. Earlier during the GOP primaries, Tom Petty had clashed with Republican candidate Michele Bachmann over the usage of his song "American Girl" at her rallies. News of the dispute was spread via social media such as Twitter, Facebook, and via blogs such as Politico. Petty's agent published a press release threatening legal action if his song continued to be employed in this fashion. This raised a relatively new issue in the ongoing dialogue between musicians and political actors, the question of whether the use of a song within a social media campaign should be construed as an endorsement. A related question surrounded the legal ramifications of music usage by campaigns without permission. Historically, such use is legal at a live event, but not in a broadcast context; by splitting the difference between the two, social media highlighted the changing nature of public political communications.

Role of Musicians in Local Elections

During the 2012 congressional campaigns, Texas GOP Congressman Steve Stockman held a live YouTube chat with conservative musician Ted Nugent. Nugent had previously considered running for governor of Michigan in 2008, during which time he repeatedly singled out high-profile Democratic politicians for criticism via social-media platforms such as Facebook and YouTube. Even earlier, during the 2004 congressional campaign cycle, there was widespread speculation that Nugent was under consideration by the Illinois Republican Party as its candidate in that state's Senate race. Even at that time, he had been especially active and vocal in supporting conservative political views on Myspace, promoting his views and his recorded music.

In 2010, conservative musician Ray Stevens, who has shared his political conservative views via social media platforms such as YouTube, was endorsed for Congress by the Republican Party of Lee County, North Carolina. His YouTube video *Come to the USA* was embedded in the official Web page of that county's Republican Party, with a message above it urging viewers to vote for the musician. Stevens was already a popular YouTube

performer, having released videos for some of his songs exclusively on that social media platform.

Economic Costs to Musicians

The economic costs to musicians of picking sides in political debates on social media have been exemplified by California alternative rock band Cake. Guitarist Xan McCurdy posted a message to the band's Facebook artist page in 2011, asking whether Republicans were intentionally damaging the U.S. economy in order to prevent Obama's re-election the following year. Facebook users left over 600 comments expressing varying degrees of outrage or approval. This was hardly an exception for the band, which had excoriated GOP vice presidential hopeful Sarah Palin on its Web site in 2008. The band's lead vocalist, John McCrea, acknowledged in 2010 that many of its fans were conservatives, including Tea Party members, and he described how this constituency was upset with the band's enthusiastic embrace of liberal political dogma. McCrea claimed that, as a form of political retaliation, some critical fans had threatened to illegally download the band's songs, rather than purchasing them via sanctioned distributors such as Apple's iTunes store.

On the conservative side of the political spectrum, Ted Nugent has been a vocal supporter of the U.S. Republican Party and conservative political views throughout his career. In 2012, Nugent endorsed Mitt Romney for president, a position he reiterated and promoted via social media numerous times during that year's election cycle. Following the re-election of President Obama, Nugent shared his passionate hatred of the president via Twitter and other social media channels. Even more controversially, Nugent has made repeated threats to kill Obama via Twitter, although in several media interviews following his subsequent investigation by the Secret Service, he later described these threats as "metaphorical." They were, however, retweeted aggressively by supporters and pundits. As far back as 2007, he publicly threatened to kill both Barack Obama and Hillary Clinton.

Musicians' political views shared via social media can drastically alter their reputation in the entertainment industry and the public at large. Their political thoughts can directly equate to economic costs, both when they channel their

political views through music, and when they damage their reputation through hate speech or rhetoric of a controversially political nature that is broadcast over social media.

Myspace

Self-described as "a place for friends," Myspace was once the world's most popular social networking Web site. With features including customizable profile designs, mood-indicating emoticons, profile songs, and a user comment section, Myspace was the first Web site to make

online social networking a part of mainstream popular culture.

Building on the online social networking concept pioneered by Six Degrees and Friendster, an early version of Myspace was created by eUniverse (later renamed Intermix Media) employees Chris DeWolfe and Tom Anderson in 2003, and was officially launched in January 2004. With DeWolfe serving as Myspace CEO and Anderson serving as president, Myspace reached 1 million users within its first month, and over 5 million users by the end of its first year.

The quick growth of Myspace led to a high profile, \$580 million acquisition by News Corp. in July 2005. Underscoring the cultural relevance of Myspace in the media landscape of the time, the acquisition was intended to provide a social media centerpiece that would connect the diverse holdings of News Corp.'s newly formed Fox Interactive Media division.

Profitable and continuing to grow, Myspace added its 100 millionth user account in August 2006, and surpassed Google search and Yahoo! Mail to become the most visited Web site in the United States. The growth continued for the next two years, eventually reaching its peak usage in December 2008, with 75.9 million unique visitors in the United States and 110 million active users.

Influence

The height of Myspace's popularity corresponded with the 2006 and 2008 election cycles. While Web sites and blogs had been a part of political campaigns since the mid-1990s, online social networking was first adopted as a political tool during the 2006 and 2008 campaigns. The development was slow at first. In the 2006 mid-term elections, only a small minority of candidates running for state or national office created and maintained profile pages. However, by the start of the 2008 presidential primary campaign season, the relevance of social networking was clear, and all candidates for both the Democratic and Republican nominations had established Myspace profiles. The social networking Web site encouraged this development by launching Myspace Impact, a site that featured pages for presidential candidates and made it possible for visitors to register to vote, volunteer for campaigns, and make donations. Within one day of

its launch, thousands of users had friended leading candidates.

In addition to fostering a sense of political fandom, social networking Web sites offered a new way to organize a campaign, and encouraged the growth of grassroots political movements. Further, because the most frequent users of Myspace were in the 18 to 24 age range, the social-networking Web site provided a platform to connect with younger voters who played a key role in deciding the 2008 election.

To further involve younger users in politics, Myspace also partnered with MyDebates.org to offer live streams of presidential campaign debates, and provide a forum for users to submit questions to a town hall debate.

While Myspace was helpful for some candidates and elected officials, it proved troublesome for others. The first Myspace political scandal surfaced in March 2008, when New York Governor Eliot Spitzer was accused of employing the services of Emperors Club VIP escort Ashley Dupré. Photos posted on Dupré's Myspace page were quickly publicized by reporters and circulated around the Web, drawing even more attention to the scandal, and making Dupré an overnight Internet celebrity. The importance of online social networking in political campaigns grew in the years that followed. However, the relevance of Myspace in the political world quickly diminished as the site's popularity faded among the general public.

Decline

Despite its early growth and dominance, limited innovation, an outdated platform, and competition from other social networking sites such as Facebook and Twitter ultimately eroded Myspace's popularity. While Facebook was developing a streamlined social networking experience based around creating an online connection with real-world friends, Myspace was earning a reputation for amateurish profile designs, cluttered advertising, and spam.

The decline of Myspace started internationally, and eventually spread to the U.S. market. In May 2008, Facebook's global popularity decisively surpassed that of Myspace, with Facebook attracting 123.9 million unique visitors and 50.6 billion pageviews, compared to Myspace's

114.6 million unique visitors and 45.4 billion pageviews. As Facebook continued growing, visits to Myspace dropped off. A year later, Myspace also slipped behind Facebook within its home market. In May 2009, Facebook surpassed Myspace domestically, with 70.278 million unique visitors in the United States, compared to Myspace's 70.237 million.

While the margin was narrow at first—just 41,000 monthly visitors—it quickly widened as Myspace lost users and the accompanying advertising revenue. In January 2011, Myspace laid off nearly half of its employees, and by February 2011, with unique visitors totaling just 62 million worldwide and 37 million in the United States, News Corp. announced its intention to sell the social networking site. The sale was completed in June 2011, when Myspace was sold to the advertising network company Specific Media for \$35 million, just 6 percent of what News Corp. had paid for the Web site six years prior.

By 2012, Myspace had essentially ceded its status as a relevant social-networking Web site to rivals Facebook, Twitter, and LinkedIn, and rebranded itself as a “social entertainment destination.” Moving away from its previous social networking model, the company retooled the Web site as a music and entertainment hub, offering audio and video content, and providing tools for bands to create Web pages.

Myth of Digital Democracy

The Internet's influence on political life and other democratic processes has sown strong hopes for a new phase of democratic governance. Huge numbers of previously inactive citizens are paying closer attention to elections, as evidenced by the proliferation of political blogs and their successful political mobilization through the Web. In North America, some look to the 2004 U.S. presidential elections and how candidate Howard Dean's campaign succeeded in funding its operations through small donations, a feat that President Barack Obama's 2008 campaign successfully emulated. The political ascendancy of blogging and other social media and new communication technologies are ushering in an age of digital democracy and digital citizens. In a *Wired* essay, Jon Katz was among the first to argue that the culture of cyberspace has led to the birth of a digital nation. This digital community espouses a “postpolitical” philosophy that blends “the humanism of liberalism, the economic opportunity of conservatism, plus a strong sense of personal responsibility and a passion for freedom.” Katz describes these American digital citizens as “knowledgeable, tolerant, civic-minded, and radically committed to change.” They embrace the power of technology to foster a “participatory” culture and contribute to the political process.

Against this optimistic background, Hindman's *Myth of Digital Democracy* offers a rare exception to this unconditional embrace and glorification of Internet-based politics. Two intertwined claims have been central to the proponents of digital democracy: that the Internet fosters political participation, and its diffused infrastructure levels the political playing field. The first central promise of the Internet lies in its capacity to enhance citizens' participation in the political process,

granting different political voices an equal footing in the networked public sphere. For Hindman, this claim remains more of a promise, and less supported by empirical data. While acknowledging the fact that the Internet allows people to speak freely online, there is a difference between who speaks and who is heard. The political blogosphere in the United States shows that those who are heard remain far below the number of those who speak. Only a very small number of political blogs, both liberal and conservative, receive a level of influence and reach to be meaningfully heard and influence the political discourse. Hindman's analysis of the U.S. political blogosphere, its resemblance to traditional media elites, challenges some assertions that the blogosphere threatens the old media monopoly and empowers citizens in the marketplace of ideas. Lack of gender and ethnic diversity among top political U.S. bloggers only emphasizes this gap between rhetoric and reality.

Nature of the Internet

The diffused nature of the Internet's infrastructure lends credence to the claim that the Web provides a level playing field. The current ownership structure means that the monopolistic corporate control dominating traditional U.S. media's landscape disenfranchises large sections of the American people by limiting access and filtering the news. Moreover, corporate control makes it nearly impossible for new entrants to compete and set up media outlets, unless they have large financial resources. Negroponte's *Being Digital* and similar books vehemently argue that the Internet's technological infrastructure lowers the barriers for entry, thus enabling politicians and regular citizens to compete against corporations. This communication technology promises to further eviscerate corporate control because online users can search for whatever they want, and retrieve the information they like, without the filter of corporate control. Hindman's scrutiny concludes that the Internet's architecture, specifically hyperlinking, has failed to truly weaken the power of corporate gatekeepers. Rather than being equal, search engine algorithms, and inequalities in link structure and traffic, create a "winner-takes-all" pattern: Only a few successful political sites dominate the political communities to which they belong.

Moreover, as Hindman argues, the Web is experiencing "Googlearchy," that is, dominance of the most heavily linked Web sites. Empirically, a Web site's visibility and prominence remain determined by the number of links pointing to the site. That makes search engines and online searches a shallow process because they yield only the most linked or familiar sites, but not necessarily the best sites. Since digital content is not cheap to produce, few companies own the largest and most popular sites, further constraining the purported diversity of the Web. Hindman's Googlearchy theory posits that "online concentration comes from the sheer size of the medium and the inability of any citizen, no matter how sophisticated and civic-minded, to cover it all." When factoring in the fact that political traffic constitutes a small fraction of overall Web usage, the political impact of the Web is much in doubt.

Digital democracy is more of a pipedream, a myth that does not withstand empirical scrutiny. This position may thus perpetuate the perennial debate/tensions surrounding the advent of new communication technologies, particularly their sociopolitical transformational impact. As several critics and book reviewers have observed, the impressive empirical case that Hindman assembles does not fully account for the tangible effects of the Internet on quotidian politics. The Internet has effectively challenged the power of the political class to control the message. Social media channels like Twitter and blogs offer myriad ways of interacting and fact-checking partisan propaganda. As to extending political voice, the Internet has made the marketplace of ideas something within reach because new entrants can still create content and compete. While regular citizens may volunteer, vote, and organize online, the Web's net effect has mobilized more people, as small donations attested in Obama's campaigns.

Myth Versus Reality

Hindman fails to account for and empirically analyze the larger effects of the Internet on the political ecosystem, to bust the mythical construction of Internet-based politics. In *Digital Citizenship, the Internet, Society and Participation*, Mossberger, Tolbert, and McNeal conducted such analyses of the Internet's impact on U.S. politics, using data from two Pew Internet and American

Life surveys from the 2002 congressional elections of 2002 and the 2004 U.S. presidential elections. Their results confirmed the positive role of the Internet in politics, leading them to conclude that the Internet enhances civic engagement and political participation.

The Internet's effects on political life in other parts of the world challenge Hindman's assertions. Social media tools, including blogs, Twitter, and Facebook, have been indispensable to activists fighting for political change, from Burma and Ukraine to Egypt and Iran. During the Arab Spring uprisings, social media helped activists and citizens spread dissenting information, share news that countered authoritarian regimes' narrative, and mobilize the populace. Digital democracy does not mean, nor should it herald the end of, collective action and offline political life. In tempering any assessment of new media's political effects, a more balanced perspective would recognize that digital democracy does not necessarily need to translate into an egalitarian, utopian ideal, and that Googlearchy remains a legitimate threat. While it is warranted, a solid critique of the unconditional embrace of the new digital democracy ethos should also propose ways of addressing the democratic risks entailed in the concentration and monopolization of the Web. A balanced critique thus needs to suggest means of safeguarding the openness of the Internet, combating the fragmentation of the public sphere, and ensuring that online public space remains accessible and democratic.

Hindman's work along these lines articulates an importantly unsettling view of Google's role in the "New Democracy." It also raises new and crucial questions about how to study the political implications of online and social media in general, focusing on the need for a sound empirical basis to support the host of political "game-changer" claims currently attributed to them.

N

Nation of Islam Movement

Around 1930, Wallace Fard Muhammad founded the Nation of Islam in Detroit, Michigan. The Nation of Islam is known as a religion, empowerment organization, new religious movement, or black nationalist/separatist group, depending on the speaker and audience. The Nation of Islam primarily focuses on the needs and interests of African Americans. Statistics vary widely for formal membership and number of lay followers: 19,000 on the low end to 60,000 or more on the high end. Members of the Nation of Islam typically engage with each other in person at different venues and online via social media. The organization's Web presence in particular has several purposes: education, recruitment, publicity, and debates. The communications that occur under these categories contain both religious and political content.

Web Sites

The official Web site of the Nation of Islam serves as an educational repository, recruitment tool, publicity device, and debate forum. The Web site has information about the origins of the organization and its official platform titled "The Muslim Program," which has two parts—"What

the Muslims Want" and "What the Muslims Believe"—and covers religious and political values as well as public policy preferences. The Web site also describes the background of key leaders such as Elijah Muhammad, who succeeded Wallace Fard Muhammad in 1934; and Louis Farrakhan, who in 1978 reoriented/revived the organization according to Elijah Muhammad's teachings as a shift from changes made by Warith Deen Mohammed. Additionally, official Nation of Islam statements on a range of topics like education, service projects, support for political allies, and commentary on current events, along with live Web casts every Sunday morning at 10 A.M. central time and a video archive of past speeches, are on the site.

Three separate sites are linked to the main Web site. The first is "The Final Call Online Edition," which is the online companion to the *Final Call* newspaper. Both papers cover national and international news. More multimedia material from the *Final Call* can be found on its YouTube Channel, which had over 6,000 subscribers and over 4.8 million video views as of December 2012. The second link is for the "Nation of Islam Research Group," a site containing blog posts, newsletter contributions, books and DVDs/CDs for purchase, and multimedia (such as video, audio, and photographs).

These two Web sites frequently function as spaces to engage members, observers, and critics

A Nation of Islam member offers the *Final Call* newspaper at a Notting Hill street fair in London, England, in August 2011. The *Final Call* now has an online edition and Twitter, YouTube, and Facebook accounts.

on a variety of controversial issues. Examples include denying the charges of anti-Semitism and racism by the Anti-Defamation League and other groups, especially concerning the two-volume work *The Secret Relationship Between Blacks and Jews*; drawing attention to political and economic inequalities between racial groups in the United States; challenging the label of “hate group” by the Southern Poverty Law Center; and taking certain stances in foreign policy debates centered on countries like Israel and Libya.

The third Web site linked from the Nation of Islam’s main site is for the “Millions More Movement.” An extension of the 1995 Million Man March in Washington, D.C., the Millions More Movement consists of local organizing committees across the United States that mobilize volunteers to support the advancement of African Americans in the areas of unity, spiritual values, education, economic development, political power, reparations, prison issues, health, artistic/cultural development, and peace. Most of these online resources are free and open to Nation of Islam members and the general public.

Social Media

The Nation of Islam utilizes other forms of social media besides Web sites. Current leader and minister Louis Farrakhan uses Twitter to inform, counsel, recruit, and publicize events. As of December 2012, there were over 120,000 followers for his Twitter feed. Followers can ask questions of Farrakhan, and he responds to clarify and justify particular religious and political positions. The official Nation of Islam Twitter account has almost 3,000 followers. It is mostly used for publicity purposes. The *Final Call* newspaper account has over 12,000 followers. It directs readers to full-length articles and promotes Nation of Islam activities such as the annual Saviours’ Day Convention.

The Nation of Islam also uses Facebook as a technological instrument to advance its religious and political programs. The *Final Call* newspaper has a Facebook page, as do multiple individuals, local groups, and mosques affiliated with the Nation of Islam. Facebook users share news, links, images, videos, and commentary of interest. Facebook is interactive in that it permits users to demonstrate support via a “like” icon, and there is space to share opinions. Although specific statistics for the frequency and range of online participation are unavailable, it appears that Facebook and Twitter are more supplemental than core modes of communication for the organization.

The Nation of Islam understands the role of social media in religion and politics. It strategically makes use of different platforms to support followers and attempts to change other groups’ common misconceptions or stereotypes about the organization. Critics of the Nation of Islam continue to employ social media to question and discredit the organization. Time will tell if technology will contribute to the strength and stability of the organization or if technology will hasten its decline.

National Center for Digital Government

The National Center for Digital Government Research and Practice (NCDG) was originally established by Dr. Jane Fountain in June 2002, within the John F. Kennedy School of Government at Harvard University, and is codirected by Dr. David Lazer. A three-year, \$1.5 million grant awarded by the National Science Foundation (NSF) originally funded the center, with the early mission to conduct research into ways that burgeoning information technologies were integrated into strategies for governance and civic discourse. Understanding the impact of information technology within the intersections of institutions, individuals, and government was deemed by NSF of paramount importance in advancing research aimed at developing and implementing effective policy frameworks.

Jane Fountain's academic background includes a master's degree in education (Harvard) and Ph.D.s in organizational behavior and political science (Yale), with research focuses on institutional change, virtual governance, and the impact of information technologies on these topics. David Lazer's academic credentials include a B.A. in economics (Wesleyan) and a Ph.D. in political

science (University of Michigan); his primary research interests included the role of social networks in governance and the use of technology within the criminal justice system, particularly the use of DNA analysis.

Since 2005, Dr. Fountain and the NCDG have been based at the University of Massachusetts, Amherst. Its successor program at Harvard, the Program on Networked Governance (PNG), also supported by the NSF, was founded by Dr. David Lazer. Together, these centers have greatly expanded the scope and reach of the social scientific research, training, and applications of information technology and communications originally funded in 2002 to produce a global network linking scientists, researchers, and practitioners with governing bodies, civic communities, and institutions. Related programs within Harvard's Kennedy School of Government are the Belfer Center for Science and International Affairs, and the Taubman Center for State and Local Government.

Originally established as a relatively simple research network, the focus and influence of the NCDG rapidly expanded. The first activity of the NCDG was a foundational workshop on Developing a Basic Research Program for Digital Government, held from May 31 to June 1, 2002, just prior to the announcement of NSF funding and establishment of the NCDG. Several weeks later, the E-Government Act of 2002 (also known as the Lieberman Bill) was unanimously passed in the U.S. Senate. When it was signed into law in December, a new agency within the Office of Management and Budget—the Office of Electronic Government—was created, charged with overseeing "Web-based Internet applications or other information technology to enhance the access to and delivery of government information and services to the public, other agencies, and other government entities. . . ." That legislation was instrumental in authorizing and funding the original NCDG, as well as rapid expansion of its activities.

In the first two years of the NCDG, Jane Fountain was keynote speaker at the International Conference on Public Participation and Information Technologies at the Massachusetts Institute of Technology, was a featured speaker at an information technology (IT) workshop at the London

School of Economics, was a speaker at a conference on e-governance in Barcelona, Spain, delivered the keynote address at the First Seminar on Digital Government and Governance at the University of Tokyo, was a speaker at an IT conference in Santiago, Chile, and delivered an address on Governing the Virtual State at the European Information Society Technologies Conference in the Hague.

Since the re-establishment of the NCDG at the University of Massachusetts, Amherst, in 2005, and the founding of the PNG at Harvard the same year, the two centers have pursued similar, sometimes interconnected trajectories toward similar missions. Both are increasingly active on a global scale. NCDG research at Amherst “extends and refines theoretical frameworks in the social sciences to encompass fundamental changes in information processing and communications . . . to advance social and applied social science disciplines and fields as well as an understanding of digital government.”

Among more recent research topics at the NCDG are ethics in science and engineering (Jane Fountain and colleagues), networked governance (Jane Fountain), crowdsourcing and the environment (Charles Schweik, NCDG Associate Director), and e-rulemaking and democracy (Stuart Shulman, NCDG associate director, and research group). In February 2013, Workshop in the Knowledge Commons was introduced to examine issues and possibilities related to what has been called an emerging field of study, that of worldwide open access initiatives.

Recent PNG projects and ongoing research focuses have included the PNG Working Paper Series; developments in social network analysis, including focuses on teaching resources, literature, and network visualization; DNA in the criminal justice system, featured on CBS’ *60 Minutes*; Knowledge Sharing and networking among state health officials; and connecting to Congress. The connecting to Congress project reflects the mandate of the 2002 E-Government Act to develop and manage information technology that enhances the capacity for effective interaction of civic and governmental entities

National Freedom of Information Coalition

The National Freedom of Information Coalition (NFOIC) is a nonpartisan organization that supports the general public’s right to an open and transparent government. As a nonprofit organization, NFOIC relies on the hard work and support of citizens, lobbyists, and advocates of the First Amendment and a transparent government. NFOIC is funded by grants from the John S. and James L. Knight Foundation, an organization working toward improving journalism around the world. The National Freedom of Information Coalition officially met for the first time in 1989, in Dallas, Texas; at the time, it was known as the National Freedom of Information Assembly. The purpose of its first meeting was to support the growing number of active First Amendment organizations and to protect citizens’ rights to public records and governmental oversight.

The coalition’s second meeting took place in Dallas, Texas, in 1991, which was the 200th anniversary of the Bill of Rights. At a third meeting in 1992, the National Freedom of Information Assembly was officially renamed the National Freedom of Information Coalition. Today, the NFOIC holds an annual meeting, and is governed by a board of directors. Each board member is elected to serve a three-year term, while the chairman of the board can serve up to two two-year terms. Each year’s conference includes guest speakers, panels, and receptions. The NFOIC

headquarters is currently located at the Donald W. Reynolds Journalism Institute, part of the Missouri School of Journalism in Columbia, Missouri. The NFOIC is the oldest and one of the largest freedom of information libraries in the world; it contains more than a million documents and journal articles about the public's right to government information.

The NFOIC considers itself an education and resource center for local and state governments; it hopes to advise officials on ways of maintaining an open government, and ways of implementing new legislation and laws that could further support the flow of information from the government to its citizens. Twice a year, the NFOIC awards monetary grants to state coalitions and local organizations with similar goals and values. It is also responsible for managing the Knight Freedom of Information Fund, which provides financial assistance to limit the costs and expenses associated with court cases relating to freedom of information. These funds help to cover the costs of filing fees, consultation fees, and attorneys. The Knight Freedom of Information Fund has awarded over 30 grants since its inception in 2010. About half of these cases resulted in a ruling that was favorable to the free flow of information.

One such grant was awarded to a local newspaper in Westminster, Maryland, for compelling the local board of county commissioners to release its e-mail distribution list. The newspaper in question received a \$12,500 litigation grant after battling with the board of county commissioners for several months. The *Carroll County Time's* requests for the information were denied several times by the county commissioners, even after legal sources declared that e-mail addresses are not barred from public access. The board of county commissioner defended its position by pointing to concerns for cybersecurity and the potential for cyberbullying if the e-mail addresses were released.

The NFOIC supports many existing state and local-level organizations while helping to create and start up similar organizations. The NFOIC helps many of these organizations work together by aiding in fundraising and by providing forums for networking between members. By holding conferences, running an open government blog on its Web site, and utilizing many other social-media

Web sites, the NFOIC facilitates cooperation between different organizations. Education and awareness is another important aspect of NFOIC's day-to-day activities. It prepares reports and publications in order to educate and spread awareness about the public's right to information. Also, the NFOIC attempts to advise and influence appointed or elected officials about their responsibilities to the public; it hopes to establish new advocates and support for its cause. The NFOIC has partnered with many other coalitions and organizations around the country, including the Online Media Legal Network at Harvard University in Cambridge, Massachusetts.

National Press Club

The National Press Club (NPC) is a Washington, D.C., based professional organization and private social club for journalists. It has more than 3,000 members. Members of the NPC range from current and former journalists to government information officers and to those believed to be sources of news on a regular basis. The NPC offers a place for journalists to socialize and hosts speakers, including leaders in government, politics, business, music, film, academia, and sports.

The NPC also has a nonprofit called the National Press Club Journalism Institute, which provides training for communications professionals on changing media environments, and provides scholarships to journalism students.

The club was founded in 1908 by 32 newspaper reporters, each willing to contribute \$10 to the creation of the club. By 1910, the club had begun to establish itself, and welcomed William Howard Taft as the first president to visit the club. As the club became more well known, its membership levels increased, and the organization needed more and more space. In the 1920s, the club decided to build a high-rise building in the heart of Washington, D.C. The building would be home to many Washington news bureaus, and the club had its headquarters on the top floor. The building opened in December 1927, and at 14 stories tall, it was the tallest office building in Washington at the time. It was rebuilt in the early 1980s, and in 2006, a broadcast operations center was added to transmit news globally. Today, the building also houses two restaurants, the Fourth Estate and the Reliable Source Bar and Grill.

When the NPC was first created, its membership was limited to white, male journalists. Because female journalists were not allowed to be members of the club, a group of women, assisted by First Lady Eleanor Roosevelt, created the Women's National Press Club in 1919. Similarly, as a result of the NPC's discrimination, African American journalists founded the Capital Press Club in 1944. The NPC admitted the first African American male journalist in 1955, and the Capital Press Club still exists today. Members of the Women's National Press Club voted in 1970 to allow men into their club, which they renamed the Washington Press Club. Shortly thereafter, the NPC voted to admit women. The two organizations remained competing clubs until 1985, when they merged to form a new NPC.

In 1931, the NPC welcomed President-elect Franklin Roosevelt to speak at an event that has become the newsmaker luncheon series, which regularly attracts speakers such as Mahmoud Ahmadi, Nelson Mandela, Yasser Arafat, Golda Meir, Boris Yeltsin, and the Dalai Lama. Many big events have begun or have been announced at the club, such as Ronald Reagan and Jimmy Carter announcing their presidential bids, and George

W. Bush introducing his national security team during the 2000 election. It has also been argued that the club may have contributed to the launching of the Korean War because of a 1950 speech at the club by Secretary of State Dean Acheson, who outlined America's "defense perimeter" for Asia and omitted South Korea. Some believe that Soviet dictator Joseph Stalin interpreted that to mean that North Korea should prepare to invade South Korea.

Press Freedom

In an effort to promote press freedom, each year, the NPC awards the John Aubuchon Freedom of the Press Award to one domestic and one international recipient. The award honors people who have contributed to the cause of press freedom and open government. The NPC also hosts an array of speakers on the topic of press freedom, and has publicly voiced support for journalists in press freedom cases. Additionally, the Freedom of the Press Committee of the NPC offers training courses intended to help reporters understand laws relating to press freedom and journalists' rights.

The NPC received criticism in 2011 when journalist Sam Hussein, an NPC member, was suspended for asking Saudi Arabia's Prince Turki al-Faisal about the legitimacy of his regime. He was suspended for two weeks on the grounds that such action violates the NPC rule prohibiting "boisterous and unseemly conduct or language in or about the club." The NPC received criticism for not allowing journalists to be journalists inside the club because of the incident, and the suspension was later reversed.

Near-Me Tabs and Political Protest

Near-Me tabs are a function of proximity-based applications (PBAs), applications and functions designed to allow for mobile devices to detect nearby events, people, news, or other happenings within a certain geographical distance in space. The rise of global positioning system

(GPS)-enabled phones and tablets, alongside the prevalence of data-enabled devices as part of the “mobility turn” of the 2000s, allowed for new practices of connectivity during this era. However, a PBA allows for temporary, localized connectivity between anyone with a mobile device, either directly through automatic geotagging of items such as images, videos, or social media posts, or through opt-in geomapping through technologies such as Google Maps. These types of technologies were particularly useful in the many protests in 2011 and 2012 that used social media as an organizational tool, particularly the Arab Spring and global Occupy Movement that heavily used Twitter and Facebook.

Proprietary software protocols or mobile services are necessary to access GPS-enabled mobile devices and applications, which often allow users some degree of control over their ability to be

Proximity-based applications allow for temporary, localized connectivity between anyone with a mobile device. These applications became especially useful to both Arab Spring and global Occupy Movement protestors in 2011 and 2012. This group of protestors checked their mobile phones at a rally for Egyptian democracy in San Francisco, California, in early 2011.

both located and contacted in geographic space. However, the uses of these location-based services have raised concerns over user privacy in terms of both the data available to the administering companies of these applications and to wireless carriers, particularly through sometimes confusing or changing privacy policies. This practice has also raised troubling questions in terms of surveillance by law enforcement agencies.

The uses of PBAs are still being realized as the technology develops and new applications are developed. Stores can send coupons or price discounts to shoppers who are shopping in or passing by a physical location; several large retailers have experimented with these technologies lately. A parent who loses a child in a shopping center can broadcast a localized message to other shoppers nearby through the creation of a Near-Me area network, a localized wireless network between several wireless devices in close proximity to one another. Individuals can be notified when their PBA-enabled friends are within a certain geographical distance of a certain phone. Videos can be viewed through an app like Vidcinity, a geographically based video service of user-generated content. Real estate listings can use GPS data to list local houses for sale or apartments for rent. Facebook briefly experimented with a PBA friend finder in 2012 before canceling the service. In each case, the technology works in a relatively open infrastructure, allowing for interoperability between wireless carriers and network protocols, with a focus more on close geographic proximity, rather than on localized networks.

Political Protest and Massing Publics

With the rise of the global Occupy movement, the Arab Spring, and other protests that emerged in 2011 and 2012, PBA technology allowed for the creation of new networks of information sharing and political action, primarily through Twitter. While some critics argued that accounts of the power of social media in these protests were overblown (the Arab Spring was referred to as the “Twitter Revolution” by many in the Western press), the peer-to-peer contacts allowed these protests to not only remain flexible in their organization, but also mobile in their geographic location. In a moving protest that is taking place in several different locations at a synchronistic time, the

advantages of mobile and GPS-enabled technologies allowed for individuals to organize and amass a network-centric multitude, as well as to become aware of events in the nearby vicinity.

This was also similar to the social media uses of the global Occupy movement, particularly the New York City encampment in Zuccotti Park, which used geomapping and Near-Me tabs to keep track of happenings in Manhattan in fall 2011. The Occupy Movement was diverse and had several actions and occupations occurring in different locations, as well as skirmishes with police throughout the city and in its protest marches. These were captured on a number of mobile devices; immediately uploaded to social media, video-sharing, or photo-sharing sites; geotagged; and pooled together to paint a picture of the real-time events that occurred in geographic space.

Negative Campaigning

Negative campaigning is trying to win an advantage in elections by referring to negative aspects of an opponent, rather than emphasizing one’s positive attributes or preferred policies. Negative campaigning became commonplace in modern electorate campaigns, particularly in the United

States, but also in many other countries such as Russia and the UK. Certain forms of negative campaigning are as old as communities with an electorate. During the Roman Empire, members of the Senate used methods of negative campaigning to achieve their goals. In the United States, the presidential campaign of Lyndon Johnson was seminal for negative ads in the political arena. On September 7, 1964, he launched the advertisement "Peace, Little Girl." It shows a young girl plucking the petals from a daisy and counting from one to nine. Then, a male announcer counts down from 10. With each successive number, the camera jumps to a closer shot of the child's face. At zero, a nuclear blast fills the screen and President Johnson says: "These are the stakes to make a world in which all of God's children can live, or to go into the dark. We must either love each other, or we must die." The commercial aired just once, but caused an instant furor. NBC, the network on which the commercial was aired, was flooded with phone calls and letters. President Johnson's opponent, Senator Barry Goldwater, requested equal time from NBC to clarify his positions on the use of nuclear warheads. Television news programs on all three existing networks at the time featured the commercial and the resulting controversy.

Decades later, campaign commercials are often subject to media coverage. Newspapers and television news programs frequently report on candidates' campaign ads. Another prominent and more recent example for negative campaigning is the electoral race between Vice President George Bush and his challenger Michael Dukakis. In the 1988 presidential campaign, a black man named Willie Horton helped defeat Governor Michael Dukakis of Massachusetts. Willie Horton had committed rape while on furlough from a Massachusetts prison under a program that was actually started by another governor, a Republican. The anti-Dukakis commercial featuring Mr. Horton was spread via an outside group launched by Lee Atwater, a campaign manager for George H. W. Bush. The latter publicly denied that he had been in any way involved. However, the campaign worked. Many voters related Willie Horton's face to Democratic nominee Michael Dukakis. Many of today's third-party advertisements, like the "Swift Boat" attacks that helped defeat Senator

John Kerry in 2004, are follow-ups of the Willie Horton campaign.

Scientific Studies

Many scholars have worked on the use of negative attacks in elections and their potential adverse effects on turnout, vote choice, and democracy. They have used diverse investigation techniques like surveys, experiments, and formal models. A great deal of time and effort has been devoted to determining whether or not negative political information works, and how. It was hypothesized that it might drive everything from support for a candidate to turnout and effect on the political system as a whole. For the most part, scientific studies show that there are some effects of negative information, but their direction and impact is difficult to determine.

Scholars have shown in a metaanalytic assessment of the effects of political advertising that for every study showing the damaging effects of negative information, there was a study proving the opposite. Increasingly, negative information comes from sources beyond the candidates or campaigns themselves, particularly interest groups and the media. Both are common sources of information in the campaign context. With expenditures on interest group advertisements totaling somewhere around one-third of the money spent on political advertising, the potential electoral impact of moneyed interest groups plays a crucial role. Interest group advertising can have an informative function, but it can also attack just as strongly as an advertisement coming directly from a candidate. In this context, studies show that information from independent group ads or news story accounts are more persuasive than campaign-sponsored negative information.

Role of Media

Campaign commercials, especially negative ones, are well suited to fulfill the requirements of a good news story. Journalists usually get a good story when candidates attack one another. Allegations of dishonesty and incompetence plant the seeds of controversy and scandal. Even if the charges prove to be false, reporters can rail against the candidate who aired the attack for engaging in unfair campaigning. The political fight then becomes the story. Turning advertisements into news stories allows

candidates to set the campaign agenda, and magnifies the effects of the ads. News coverage of the advertisements recycles the political messages, providing the candidates with valuable prime time in the news, free of charge. The public is usually disappointed by such negative political disputes. For this reason, voters increasingly give election coverage in the United States poor marks. In U.S. states where campaigns were highly negative, people rated the media especially badly.

There are a number of techniques used in negative campaigning. The most common is running advertisements attacking an opponent's personality, record, or opinion. There are two main types: attack ads and contrast ads. Attack ads exclusively focus on the negative aspects of the opponent. Contrast ads contain information about the candidate and the opponent, but the information about the candidate is positive, whereas the information about the opponent is negative. Since contrast ads must contain positive information, they are considered less damaging to the political process than attack ads. Often, campaigners will use outside organizations such as lobby groups to launch attacks and discretely disseminate negative information about the rival candidate. Social media offer many new possibilities in this context. Another common negative campaigning tactic is attacking the other side for running a negative campaign.

In 1992, ad-watch journalism, in which the media acknowledge some degree of responsibility for monitoring the basic truthfulness of content contained in political advertising, appeared on the media landscape. The *Los Angeles Times*, for instance, published more than 20 ad-watch stories focusing on the two races for U.S. Senate in California. Today, ad-watches are standard in print and broadcast outlets at national, regional, and local levels. Ad-watches represent an important shift in campaign journalism. They provide reporters and editors with a tool to clarify their independence and to rebuild the integrity of their media.

Risks and Advantages

The discussion about whether negative political advertising encourages voters to participate in democracy, discourages voters to participate, or only influences voters with particular characteristics and under certain circumstances remains

ongoing and heated. Studies on the topic of negative campaigning do not show consistent findings regarding the effectiveness of such a campaign strategy. Negative campaigning may keep people away from the polls for different reasons. One reason is that negative advertising may discourage supporters of the candidate who is attacked. An alternative explanation is that negative advertising makes the public disenchanted with both candidates. That way, candidates unintentionally disappoint their supporters by using negative advertising. Finally, negative campaigning may diminish the power of civic duty, and may undermine the legitimacy of the entire electoral process. Campaigns that generate more negative than positive messages may leave voters embittered toward the candidates and the rules of the game.

Negative ads can produce a backlash. For example, in the 1993 Canadian national election, Conservatives attacked the physical handicaps of the liberals' candidate Jean Chrétien for prime minister. The liberals won anyway, but voters were so disgusted about the Conservatives' behavior that only two Tories were elected to Parliament from the whole country. Previously, the Conservatives had held 154 seats, so the entire party wiped itself out for one election cycle.

During the run up to the 1997 United Kingdom general election, the British Conservative Party ran a campaign that stated that the Labour Party was dangerous, and used posters of Labour leader Tony Blair with "demon eyes" on them. Many voters rejected this claim, the campaign failed, and Labour won in a landslide. Negative campaigning can backfire in many ways. It can turn off voters and can cause opponents to respond in kind. It can cause voters to wonder if the other candidate has some of the same negatives that his or her opponent seems to have, and can create a negative campaign for the candidate's opponent. Because of the possible harm that may arise from being seen as a negative campaigner, candidates often pledge to refrain from such negative attacks.

In commercial advertising, various regulations prohibit false advertising and broadcast campaigns to promote potentially harmful activities, such as advertising tobacco products or alcohol. Similar regulations have at times been proposed by politicians to limit negative political campaigning. They argue that negative political ads

poison the political process. In modern Western societies, however, the proposed regulation of public speech is confronted by strong traditions favoring the open exchange of ideas and opinions, and by fundamental legal protections, such as the Constitution.

Network Influentials

In the media and politics domain, Alan Rosenblatt coined the term *network influentials* to describe individuals who, through social networks and social media, reach large numbers of others. This notion, not new to those who study and analyze social networks, is synonymous with the idea of a "super-connector" or a "super-actor," terms used to describe individuals within a given network who are the most connected and influential. Identifying and understanding network influentials can be a key component in dispersing information, swaying public opinion, or organizing a community around a cause. The remainder of this entry discusses some indicators (e.g., Klout scores

and LinkedIn connections) of one's network influence, illustrates why network influentials are important, and concludes with a political labor reform example of how network influentials can snowball out their effect and impact public policy and opinion.

Klout

Many policymakers, CEOs, and media executives strive to identify the individuals through whom they can deliver their message, thus resulting in the maximum network saturation (i.e., for the least amount of effort and cost, who will bring the greatest return on investment). As a rough indicator of network influence, crude numbers like the number of Facebook friends or LinkedIn connections an individual possesses have been used in the past, but these are crude indicators and do little to describe the individuals' true influence or connectedness within their network. More recently, Klout.com has elevated the ability to assess the extent to which someone is a network influential with the introduction of a Klout score. A Klout score ranges from 0 to 100, and not only factors in number of connections on social networking sites, but also the individual's ability to stimulate dialogues and inspire actions such as "likes," "retweets," and "shares."

Despite the known importance of network influentials and recent advances in identifying them, much work remains to truly conclude that these mechanisms to identify network influence are valid measures of actual influence. The primary challenge to the validity of these measures of influence is their proprietary nature—many of the algorithms used to calculate scores are kept secret, thus forcing the public to assume that measure is valid without having any way to verify it. Klout scores, for example, as mentioned above are based on some combination of "likes," retweets, and "shares," among other factors. But, how exactly a share is weighted, and how the influence of the person who shared it is calculated (or if it is calculated), are not disclosed. Certainly, a share by former President Bill Clinton's Facebook account, which has tens of thousands of followers, has more influence than a share by a friend from grade school who has only a few hundred followers. How exactly that influence is quantified remains undisclosed.

Netform

Karen Stephenson, an organizational anthropologist, runs Netform, an organization that seeks to map and measure social capital in business and society. Through Netform's proprietary process, Stephenson has conducted social network studies for both government and Fortune 500 company use.

What makes Stephenson's approach to identifying network influentials unique is that she includes the individual's propensity toward action as a key factor in her equation. Stephenson's hypothesis is that most attempts to identify network influentials and exploit their influence fail because the people commonly thought to be the most influential are also typically the most busy, and thus are the least likely or able to take action. Stephenson's approach, one that is used by many governments seeking to stimulate policy change, focuses on identifying individuals who have strong relationships across multiple community sectors; relationships grounded in mutual trust.

In this sense, the focus is not on power or hierarchical structure where a leader with the most direct reports is assumed to be most influential. Instead, Stephenson's work shows that often when seeking to effect change, individuals performing grassroots outreach in the community (e.g., a business person who offers her conference room to host local community organizations) often have the most influence given that they reach a broad array of individuals from different networks and do so in a very trustworthy way.

Example

Perhaps what Stephenson's work illustrates, and all that is known for certain about network influentials, can best be described by looking at the influence of Nell Nelson, a Chicago socialite turned newspaper reporter at the turn of the century. Well-connected socially, Nelson was one of the first female reporters for the *Chicago Times*, and authored a series of articles under the column heading "City Slave Girls." Prior to writing the articles, Nelson spent six months seeking employment and working for various clothing manufacturers in Chicago's garment district. Her goal: to chronicle and shine light on the working conditions to which women and children were

subjected. Each day, she would dress in rags, and go from employer to employer seeking work. By the time all was said and done, she infiltrated over 15 employers, documenting physical and emotional abuse, employees fined for talking and charged for cups of water, employers refusing to pay employees as promised (or when promised), and numerous instances of children as young as 12 and 13 years old working 12-plus-hour days in sweatshop conditions.

Through her social connections, Nelson leveraged her position as a reporter to shine light on these workplace atrocities and effect changes in public policy. She used her connections with the Illinois Woman's Alliance, Florence Kelly (the Hull House and National Consumer's League), Elia Peattie (Omaha Women's Club and Nebraska State Federation of Woman's Clubs), and some connections at the *New York World* newspaper to organize letter-writing campaigns, stage protests, and generate public outcry that ultimately led to a domino effect of labor policy changes at the local and federal levels. Nelson recognized, albeit over time, that she had the ability to be influential in her network, and she took action to do so. Thus, action is a key component of a network influential—the individual must be well-connected enough to impact change, and must also be willing to exploit their network in a systematic and targeted manner.

Networks, Political

Traditional social science predominately focuses on actor attributes in explanations, and on individuals or aggregates of individuals (e.g., in group-level measures) as the units of analysis. Social network scholars, by contrast, focus on relationships. For instance, rather than ascribing political attitudes to the socioeconomic characteristics of individuals, network scholars are interested in how political attitudes are diffused and sustained through social networks. Social network analysis can be thought of in three different ways: in terms of particular theories and concepts (such as structural holes), in terms of particular methods (e.g., measures of things like density, centrality, and cliques, name roster survey methods, and network visualization), and in terms of particular substantive problems (e.g., social capital, the diffusion of information, collective action, or attitude formation). More generally, social network analysis can be thought of as a paradigm that encompasses all of these things. A wide array of political phenomena potentially falls under the rubric of political network analysis.

A social network is a set of social units and the interrelationships among them. In social network

analysis, the social units are commonly called "nodes," and the relationships are called "ties." Social units can vary in scale from individuals to organizations to nation states. Ties can vary in terms of strength and content. Political networks are social networks that involve political actors and/or political phenomena. At the individual level, scholars might focus on the role that interpersonal social networks play in affecting political opinions, voting, or mobilization for collective action. At the organizational level, organizations might constitute the nodes in a social network, and coordinated activity (such as joint participation in events) in a coalition might constitute ties.

While in contemporary discourse, social media and social networks are often used interchangeably, from the perspective of social network analysis, these are not one and the same thing. Relations made through social media may be considered one type of social network, but other types of social networks exist, and social media should be thought of as a subset of the concept of social network. Digital social networks encompass social media, as well as related things such as the Internet and World Wide Web, mobile phones, and short message service (SMS). The scale of focus of political network analysis can be "ego-networks" or "whole networks." An ego-network is a focal actor, and the set of alters to which the focal actor is tied. The ego-network sometimes also includes ties among alters. A whole network is comprised of all of the nodes, and all of the ties among the nodes, in a bounded social grouping.

Another distinction that is made by network analysts is between one-mode networks and two-mode networks. In matrix terms, in one-mode networks, the rows and columns are the same actors. In two-mode networks, the rows and columns are different actors. For example, the rows might be individuals, whereas the columns might be organizations or events. With regard to the organization example, individuals are linked to one another through their joint membership in organizations, and organizations are linked together through the joint membership of individuals. At the individual actor level, "tie strength" refers to the strength of the relationship between two actors. One conceptual indicator of this is "felt closeness." Sometimes, role relationships are used as a proxy for closeness, such as the

distinction between close friends versus acquaintances. A variety of other indicators are also used in different studies, such as tie multiplexity or frequency of contact. Tie strength can also be used to describe relationships among organizations and actors at other scales. Here, the concept is somewhat less developed. One indicator that has been used is “interlocking directors.”

In social network analysis, there are also a variety of concepts and measures of subgroups. The central concept is the clique; that is, a subgroup of at least three actors, where every actor has a direct tie to every other actor in the subgroup. Other related concepts vary the threshold values for these criteria. In terms of digital social networks, ties might be measured by Facebook friendships, Twitter followers, URL links on the World Wide Web, or messages across mobile phones.

Political Networks

Political network analysis seeks to understand how relationships influence political processes. Network studies have been conducted at all levels of politics, from the influence of country-level interactions on world systems to the effect of interpersonal exchanges on the political participation of individuals. This work has helped to illuminate the fact that the political arena is a relational space. Power and influence are exercised between actors in networks, common interests are formed through connections, and information and resources flow through social structures. Social network theories provide frameworks for examining these relational dimensions of politics. Network theory has been applied to the study of political phenomena in three distinct ways. One stream of research has focused on individual political action. This work examines how interpersonal relationships affect individuals’ political preferences and behavior. A second stream focuses on collective action and social movements, and seeks to understand how interpersonal and interorganizational relationships influence the coordination of political action. A third body of research focuses on the role that networks play in policymaking processes. This work is based on the assumptions that the policy options that exist, and are adopted by governments, are in part related to the social network structure of policy actors.

Individual Political Action

Social networks play a role in both the formation of public opinion about politics and in the adoption of political behaviors, such as voting. Social connections provide conduits for information to flow between individuals about political issues. This social transmission process also provides a space for political messages to get shaped and reinterpreted to correspond with individuals’ political preferences. Additionally, social networks influence political participation by increasing access to political resources via social ties, and by reinforcing norms about the desirability of participation. The link between political behavior and social ties is shaped by two forces: persuasion (or social influence) and social selection. Persuasion theory posits that when people interact, they influence each other’s perceptions and actions. Frequent interaction between individuals shapes political attitudes, and creates normative expectations that influence behavior, such as voting choices or participation in political rallies. Social selection theory highlights the tendency of people to make connections to similar others. People choose to form ties to individuals who share their political views, embedding themselves within a network that reinforces their political attitudes. Thus, people’s political actions can be shaped by their networks, and their political preferences may also shape the formation of their network.

Collective Action and Social Movements

Collective action refers to a collectivity of people working toward a common goal. When this goal involves trying to either foster or resist social change, this activity is referred to as a social movement. While social movements can overlap with political parties and formal political institutions, they are normally conceived of as entities that are relatively less institutionalized, and as primarily involving organizations that are separate from political parties and government institutions. In recent years, social movement scholars have given considerable attention to social networks in social movements. Four types of network processes have been explored, though these are not entirely separate phenomena: personal networks that are implicated in the initial recruitment and ongoing mobilization of social movement members, inter-organizational networks that link members of

distinct social movement groups, network structures that help transmit ideas and other aspects of culture, and networks that produce social capital for group members.

Mario Diani has made networks central to his conceptual definition of social movements. He argues that what distinguishes social movements from other forms of collective action are the connections that occur between independent sites, events, and actors that link them together into a collective experience, with shared identities and goals across time and space. Diani defines social movements as "... networks of informal interactions between a plurality of individuals, groups and/or organizations, engaged in political or cultural conflicts, on the basis of shared collective identities." More recently, Diani and Bison argue that social movement scholars should recognize social movements as specific social processes, distinct from other episodes of collective action, including discrete protest events. These individual events should only be considered measures of social movements if there is evidence of their connectedness to each other. In distinguishing between organizations, coalitions, consensus movements, and social movements, Diani and Bison have defined the latter in the following way: "... social movement processes ... [are] instances of collective action with clear conflictual orientations to specific social and political opponents, conducted in the context of dense inter-organizational networking, by actors linked by solidarities and shared identities that precede and survive any specific coalitions and campaigns." Thus, networks can be viewed as an integral part of social movement phenomena.

In terms of social media and digital social networks, Earl and Kimport talk about a continuum of online activism involving: e-mobilization, e-tactics, and e-movements. E-mobilization is where the digital networks are used to facilitate the sharing of information in the service of an offline protest action (e.g., United for Peace and Justice's march and rally in Washington, D.C., in 2007). E-tactics include both offline and online components. These are usually low cost, and do not rely on co-presence for participants or organizers. E-tactics provide varying leverages of the affordances of digital networks; for example, the Web site Petition Online. In e-movements,

organization of, and participation in, the movement occur entirely online. This is an example of high leveraging of the affordances of digital networks; for example, the Strategic Voting Movement. In *Digitally Enabled Social Change*, Earl and Kimport discuss two schools of thought about the effects of digital technology on activism: supersized, it magnifies traditional processes; and theory 2.0, it actually changes the processes that underlie activism.

Policymaking Processes

Policy network analysis examines the role that actors play in the process of policymaking. This involves studying the influence of different individuals and groups, such as government agencies, lobbyists, and nongovernmental organizations, in shaping policy outcomes. Several different frameworks have been developed to explain the interaction between networks and policy development processes. The most prominent of these are the organizational state perspective, the epistemic community approach, the advocacy coalition framework, institutional analysis, and the social learning model. The organizational state perspective asserts that policy is influenced by the participation of extragovernmental organizations (e.g., social movements, nongovernmental organizations, business associations, and scientific advisory bodies) in state-policy domain events. A variety of organizations are more or less engaged in policymaking processes, and are perceived to have more or less influence, based in part on their relative position within the policy network.

Epistemic communities are networks of knowledge-based experts who define how complex problems are understood, and who identify state interests and policy options. Epistemic communities are characterized by shared normative beliefs and validation criteria, and a common causal understanding of a particular problem. Epistemic communities shape the distribution of knowledge around a particular issue through their network connections, and in turn influence perceptions of available policy choices. The advocacy coalition framework suggests that stakeholders with similar values and beliefs form coalitions so that they can compete for policy influence. These coalitions are not limited to particular issues or policies, but rather form based on similarity of core values, and work together

across multiple policy venues. Network analysis can be used to identify clusters of actors who work together based on shared values, and to characterize different policy communities based on coalition formation across several domains.

The institutionalist approach assumes that policy actors behave rationally, and that they seek network relationships in order to improve individual outcomes via collective action. Actors work together and coordinate policies so that they can achieve results that are mutually beneficial for network participants. From an institutional perspective, policy network analysis can be used to identify the types of relationships that enhance outcomes for both individual policy actors and the network as a whole. The social learning model posits that policy approaches diffuse through social networks via a process of social learning. Individuals and organizations learn about the suite of policy options available to them through their connections. Patterns of policy adoption can be understood by examining the connections between policy actors.

Social Media and Political Networks

The advent of computer-mediated communication has led to a new research agenda in social network analysis that seeks to understand how Internet technologies influence social interaction. The Internet is a constantly evolving space, and thus research on social media and political networks is also evolving. E-mail, listservs, blogs, and social media sites such as Facebook and Twitter provide platforms for forging new network connections, sharing ideas and resources, and shaping political processes. On the whole, research on networks and social media tends to support the idea that Internet technologies complement, rather than replace, face-to-face networks. For example, in a study of 61 million U.S. Facebook users, R. Bond et al. found that political messaging through social media significantly influences political self-expression, information seeking, and voting behavior, but that messages are predominantly transmitted to people who already have existing face-to-face relationships. Similarly, Y. Takhteyev et al. found that geography and language are both significant predictors of Twitter ties, and that a substantial share of Twitter connections are found within the same city, highlighting the significance

of pre-existing ties. While social media sites provide new ways to interact, they do not necessarily replace existing face-to-face networks.

The Internet does, however, make building social linkages faster and easier. It also helps people to build connections to others with similar interests because it expands the pool of available connections. Furthermore, information is more readily available online, and the cost of distributing ideas and building connections is significantly reduced. This lowers the expense of collective action, and makes it possible to build transnational networks and conduct political action on a global scale. People can be mobilized to take action through mailing lists, Web sites, and social media campaigns; however, ties formed to social movements through the Internet alone tend to be weaker than those built through existing relationships. In sum, social media provide a range of new tools to support political participation, but face-to-face networks still play an important role in mediating political action.

Case Study: Climate Change Denial Networks

In recent years, global climate change has been transformed from an object of scientific inquiry into the most visible global environmental issue. While the exact consequences are difficult to predict, authors, scientists, and environmentalists warn of droughts, sea-level rise, and increased extreme weather. There is a high degree of scientific consensus that climate change is occurring, and that it is primarily a consequence of human production of greenhouse gases. Yet, at the same time as the scientific community has been calling for action on climate change, a well-organized climate change denial movement has steadily developed, and has been working to derail efforts to combat global warming. The U.S. climate change denial movement has been widely studied, and provides an interesting demonstration of the different ways that political networks act to shape public opinion and policies. The climate change denial movement was born in the 1990s, in reaction to rising global environmental awareness. The movement was initially comprised of conservative think tanks, foundations, politicians, and members of the fossil fuel industry, and was driven by a shared concern about the perceived

impact of climate change legislation on neoliberal economic policies. At the time of its formation, this network could be viewed as an advocacy coalition, a network of disparate actors who banded together around shared neoliberal values in order to gain influence over political processes.

After its formation, the movement quickly sought to gain legitimacy through “scientific expertise.” A number of contrarian scientists vocally challenged mainstream climate science in order to sow seeds of doubt about the reality and seriousness of global climate change. Despite the fact that these scientists were not climatologists, and their work was at odds with the overwhelming majority of climate scientists, the media gave denialist scientists press attention in order to present an image of journalistic balance on the issue. Thus, the climate change denial movement had effectively formed an epistemic community of “experts” that was capable of shaping media messages on climate change, and in turn influenced perceptions of whether creating climate policy was a necessary step.

In the United States, the issue of climate change quickly began to polarize along party lines, and the denial movement gained momentum when the Republicans took control of Congress in 1994. Republican politicians formed closer links with climate change deniers, and some began to actively promote the ideas of the contrarian scientists. This shift is consistent with the organizational state perspective, whereby politicians and nongovernmental actors work together to promote particular interests and shape governmental policies. Additionally, this polarization filtered down to public opinion about climate change, and attitudes about climate change began to form cleavages along party lines within the broader U.S. population.

The U.S. climate denial movement spread its influence through a number of tactics. It organized conferences, talks, and “front groups” (grassroots initiatives that were built and funded by corporations and conservative think tanks) to develop climate denial networks and disseminate uncertainty. The movement supplemented these face-to-face interactions with a growing online presence, and began actively exporting its strategies to its networks in other countries in order to prevent global political action on climate change. This approach is consistent with a social

learning perspective, whereby the innovations of the U.S. denial movement were spread via networks to other nations. Though the climate denial movement is one among many influences on climate change action, these strategies have had a lasting impact on global policymaking. A well-organized movement that harnessed social networks in order to influence policy, it managed to undermine scientific evidence demonstrating the seriousness of climate change, and as a consequence helped to derail efforts to develop meaningful climate policy. A. M. McCright and R. E. Dunlap documented some of the dynamics of this countermovement, including its use of both mainstream and digital media.

Analyzing Political Networks

A wide array of computer software is available for analyzing political network data. Two of the most popular programs for calculating network measures are UCINET, as introduced by S. P. Borgatti et al.; and PAJEK. For visualizing political networks, two useful programs are Netdraw (which is packaged with UCINET) and Visone. Two programs specifically designed to analyze social network data obtained from social network sites are Netminer and NodeXL. These programs (in some instances with related apps) will allow one to extract and analyze Facebook and Twitter data, and calculate a variety of social network analytic measures. There are also various programs for extracting and analyzing data from other types of Web sites. In order to tease out the difference between persuasion and social selection effects, one needs to have longitudinal panel data on political actors, their relations, and related variables of interest. If one has two or more waves of data (preferably less than two), then one approach is to utilize SIENA modeling, which has been developed by Snijders et al. In the coming years, social network analysis of political networks in general, and social media related to politics more specifically, will become increasingly prominent in the social sciences.

News Media

News media hold a mediating role between the institutions of society and the public. They include print media (newspapers and magazines), broadcasting media (radio and television), and online media. The emergence of news media in their early form coincides with the emergence of a range of institutional developments that are linked with the early stages of modernity. This coincidence was the result of the institutional transformations that began to prevail in Europe in the late Middle Ages and early modernity. These transformations became prominent in the fields of economic, political, and symbolic power. In precapitalist societies, communication was characterized by the dominance of oral speech and the lack of popular print media. The use of the written word was restricted to privileged classes and dominant social classes. Those days, the carriers of news from the outside world were the moving part of the population: merchants, monks, pilgrims, and

soldiers. The development, however, of capitalist socioeconomic relations from the 16th century onward would bring a true revolution in the field of communication. Along with the removal of old modes of production and the boom of capitalistic production, the press was invented.

In the mercantilism era, national economies were developed within the modern state. The nation is formed as a modern state, with bureaucratic organization and increasing financial needs. The new capitalist relations that prevail in the economy require the emergence of new media for communication, which broaden the social base of political participation and deliberation. Within the political and social context that shaped the mercantile phase of capitalism, the press was developed into a true revolutionary power. The actors of this new mode of production were the rising bourgeoisie. The request for participation in the regulation of public life required complete information and knowledge of all the current issues. The press was developed in order to fulfill the needs of the new social class: public policy debate and criticism, financial reporting, and dissemination of ideas and beliefs that reinforced a new urban way of life, thinking, and behavior.

Habermas follows Bücher in identifying three phases in the historical development of the press. In the first phase, the newspaper business is organized as small handloom units. The interest of the publisher for this business is purely commercial, and the activity of the organization consists of managing news circulation and printing. In this phase, the press has no political function. At the later stage, news writing acquires a competitor, literary journalism, converting the newspapers from publishing news institutions to institutions and leaders of public opinion.

During this second phase, the structural transformation of the press is witnessed: the profit-oriented function of the press is minimized, and its role as watchdog of public political institutions begins. The central role in the political function of a newspaper is the lead article of the newspaper. Publishers financially support the press, and are not that interested about the commercial performance of their business. Without the agony of generating profit, the press can become a critical instrument of the political thinking and acting public. The press plays a crucial role not only

in informing the public, but also in shaping and mobilizing public opinion.

Following the ideal type of public sphere of Jurgen Habermas, Brian McNair summarizes the specific functions that news media are expected to perform in the media in democratic societies. The media, therefore, must: inform the public about everything that happens around them (surveillance or monitoring function); provide knowledge on the importance and significance of events; provide a framework for public policy debate between citizens, facilitating the formation of public opinion within which public opinion is formed; expose publicly the party and political institutions (control function); and act as channels for the expression of different viewpoints.

Media organizations are experiencing vast transformations that drastically and rapidly change their role and functions because of the

growing popularity of social media. The Internet is changing the media landscape of the 21st century. The transition from the era of print and broadcasting media to the emergence of the new online platforms has structurally changed the flow of information, introducing a nonlinear model of communication that is multidirectional. A distinction that can help show the way that the Internet is incorporating the qualities of traditional media and at the same time innovating is to distinguish between conversational and group media. Conversational media, such as the telephone, allow horizontal communication (one-on-one). On the other hand, group media, such as the television and the press, allow vertical communication from a sender to a specific cluster (one-to-many).

The Internet is good at both: it allows communication toward all directions, supporting direct and interpersonal communication (as a conversational medium), as well as mass communication

A man wears a gas mask to film a protest in Taksim Square, Turkey, using a television camera during the first week of protests in June 2013. During the Arab Spring protests that began in 2011, citizen journalists were often the only ones who could avoid government censorship of traditional media or access remote places; their work was sometimes the only available journalism about certain events.

(as a group medium). It becomes the canvas on which all media converge, and constructs a network with complex dynamics.

Web 2.0 has become the buzzword describing a plethora of social media available on the Internet, including blogs, photos, file-sharing systems, and social-networking sites. Web 2.0, with its social platforms, introduces its users to the possibility to interact or cooperate, offering them the choice to become producers and transcend their passive role as audience of content that was created for them. Digital social platforms change the way that people connect, communicate, act, and interact. They form social clusters on various levels (local, national, and international) as well as around common interests or problems, media, and political agenda.

Citizen Journalism

These new forms of social media and networks enable the active involvement of the public in the news process, causing cracks in the (until recently strictly defined) dichotomy between the producer and the consumer of news. The public can significantly contribute to the agenda of mainstream media, or even set an alternative agenda on alternative media platforms. The lifecycle of news becomes even more complex and difficult to define. News that appears online can be easily ignored, buried in the vast new attention economy. The mainstream media remain powerful in the selection and determination of the public agenda. However, the emergence of new participatory forms of news production and dissemination puts into doubt the certainty that the setting of the media agenda is only one way, and is directed from the mass media to the public. Influences on the determination of the daily agenda are three-fold: new professional journalistic standards and practices, a more interdependent intermedia agenda-setting process, and the growing news content produced by citizens.

The field of information and communication is evolving into a more participatory media ecosystem that transforms the news into a social experience. The news becomes a participatory activity in which people contribute their stories and experiences and post their reactions to events. The Internet is changing the relationship between journalists and their audiences from a one-way,

linear, asymmetric communication model into an interactive, nonlinear, participatory model. In other words, the Internet allows the opening of a dialogue between the producers and consumers of news. News is no longer static, but open to transformation. In this way, journalists can enrich their produced news content with the views, thoughts, and creative expressions of their audience. For the consumer of news, the digital revolution creates an abundance of options, but can also lead to fragmentation of attention. Existing forms of media are challenged by new online media platforms that offer added values: personalization, interactivity, and feedback.

These innovations are not only changing the structural nature of media consumption, but also signal a new era in which consumers can now act as coproducers and co-distributors of news content. At the other end of the news chain, media organizations require larger volumes of news content than can be produced by professional journalists. To saturate the demands of 24/7 online media platforms, publishers are becoming increasingly dependent on external suppliers for news material from their public. At the same time, they search for new communications applications in order to make their news content more relevant to the needs of the public.

Web 2.0 technologies provide the public with popular and accessible tools that enable them to publish text, pictures, audio, and video. Traditional media, the press, radio, and television are not participatory platforms. However, traditional media are developing new interactive features and experimenting with participatory forms of content production in order to involve and engage the public in the news process. Strong media organizations compete in order to dominate the new emerging field of new media and social networks. The purchase of Flickr (a photo-sharing Web site) by Yahoo! in 2005, the acquisition of Blogger.com by Google in 2003 and YouTube in 2006, and the acquisition of Newsvine by MSNBC in 2007 are a few examples.

In the example of CNN, the media organization developed the collaborative journalistic platform iReport, where people freely publish their content. In cases of censorship of traditional media, especially in the protests associated with Arab Spring, citizen journalism emerged as the

only available news. However, the movement of citizen journalism does not signal the end of the determination of the news agenda by mainstream media organizations. They still set the tone of the selection and hierarchy of the online news agenda. The most significant change is that the dominant traditional media compete to attract the attention of the public with a plethora of online news and entertainment content. This indicates a redistribution of power in the modern media ecosystem, from professional journalist to the citizen.

Nongovernmental Organizations

Nongovernmental organizations (NGOs) have been pivotal participants in international politics and governance for over 60 years. While organizations such as Rotary International have existed for far longer, with the creation of the United Nations (UN), the role and position of NGOs was formalized at a global level. Today, the significance of NGOs to international and national politics is such that they are routinely consulted by governments and intergovernmental organizations. However, the strength of NGOs lies in the range of social issues they espouse and the vast numbers of people whose interests these

NGOs represent. Considering the complexity and immensity of the task confronting NGOs, social media has been a boon to the activities of these organizations. Social media has impacted every facet of the work that NGOs do, including advocacy, community outreach, and fundraising. Furthermore, social media has opened avenues and opportunities for NGOs that were not previously available. Still, there are challenges that continue to confront NGOs and their effective use of social media.

The term NGO refers to a broad variety of organizations operating both at local and international levels. The term emerged out of the UN in 1945 from a need to define the nongovernmental agents inducted into the UN system through consultative status. However, over time, there has emerged an agreement that a definition of NGOs must include at least two elements: method of organizing and outcome orientation. In the methods of organizing, NGOs are characterized as being a nonprofit and voluntary citizens group. As to an outcome orientation, NGOs are expected to be working toward a nonviolent social mission, such as eradication of poverty or provision of health care. In addition, to be recognized by international governing bodies, NGOs are expected to have a formalized structure and accountability to their stakeholders.

Role in Civil Society and Politics

Scholars conceptualize society as constituted by three sectors: governments, businesses, and the voluntary sector. NGOs are categorized as belonging to the voluntary sector where they have played an increasingly significant role over the last 20 years. While initially, NGOs were seen as filling gaps in service and infrastructure left by government and businesses, in recent years, the political significance of NGO activities has been receiving increasing attention. Scholars suggest that NGOs strengthen civil society by facilitating participatory and democratic solutions to social issues. The role of NGOs in civil society has also gained prominence as international organizations such as the UN and European Union (EU) have established formal avenues for consultations with NGOs on policy issues. For example, for more than 60 years, the UN has been organizing an annual NGO meeting at its New York

headquarters. The annual conference is open to the 3,500 NGOs that have been granted consultative status with the UN. As for the EU, after decades of holding consultative status, in 2003 all 400 NGOs holding consultative status were automatically granted participatory status in the European Council.

NGOs play a significant role in international as well as national politics by providing an organized and sustained effort around various social events and issues. Some well-known instances of such activity would be the International Red Cross Society and human rights, Greenpeace and environmental protection, and Transparency International and systematic corruption. NGOs also have traditionally been the vehicle through which individual citizens can have their voices heard on the national and international stage. While it would be difficult for an individual or even a group to engage in advocacy on the national or international stage, being part of an NGO makes this possible. In the case of advocating for women's rights to be put on the global agenda, NGOs and their rigorous efforts at the UN are given credit for the organizing of several international conferences on the issue.

Challenges

NGOs have faced various challenges over the years in their efforts to fulfill their social missions. The dearth of financial resources is a major hurdle that must be overcome. Often, NGOs depend on memberships or individual donations to conduct their work. However, the major source of funding for most NGOs continues to be donor-based funding. Donor funding usually comes with constraints built in by donor agencies. Thus, fundraising and satisfying donors are some of the major activities for an NGO. Most NGOs continue to work under substantial financial constraints that make advocacy, research, and outreach a challenge.

NGOs from developing countries have also had to contend with infrastructural limitations. For these NGOs, gaining access to the basics of communication technology, such as phone and Internet access, can be a luxury. Finally, NGOs face political and social pressures from governments, business, and groups that are negatively affected by the NGO's advocacy and efforts on

behalf of disadvantaged populations. This has often put NGO workers and activists in harm's way. In addition, mass media has not traditionally been open to providing sustained or meaningful coverage of causes espoused by NGOs, or of the work of NGOs themselves.

Social Media and NGOs

The rising social and political significance of social media has not gone unnoticed by the NGO community and its stakeholders. Social media have been said to offer vast opportunities to NGOs by facilitating communication and coordination activities. Social media promise to revolutionize the way that NGOs fundraise, connect with stakeholders, disseminate information, and network with other NGOs. While some of this potential has been realized, much ground remains to be covered, and there are challenges that will need to be overcome.

Outreach and Fundraising

One of the most prominent areas of social media impact for NGOs is in the area of outreach. NGOs are able to use social media tools such as Web sites, blogs, microblogs, and videos to share information, tell stories, and encourage action. Social media also allows organizations to introduce, talk about, and discuss their initiatives. Digital storytelling has been a particularly successful strategy for outreach, as evidenced in the case of Hoshyar. Hoshyar, a Pakistani NGO advocating women's education in the Swat Valley, teamed up with Sliderocket to create a video. It went viral, and garnered global recognition for this tiny NGO operating in a geographically secluded area. Stakeholders have the increased benefit of interactivity, of being able to communicate with the NGO, and other stakeholders.

Social Media are revolutionizing the way that NGOs engage in fundraising. While online donations have long been a Web site standard for NGOs, the advent of social media has introduced newer and broader avenues to solicit donations. The American Cancer Society has been using Second Life to recruit virtual volunteers and raise money. Other NGOs have used Twitter and Facebook to highlight issues and solicit donations. The organization Charity: water was able to raise over \$200,000 using Twitter. While funding via social

Volunteers lighting candles near the Brandenburg Gate in Berlin, Germany, during the Earth Hour Global event in 2012, during which lights were switched off all over the world in what was billed as “the world’s largest display of environmental action.” The event was an initiative in partnership with the large nongovernmental organization World Wide Fund for Nature (WWF).

networks has been elusive, it still offers NGOs a platform to engage their stakeholders in such campaigns. Recently, a plethora of crowdfunding Web sites have sprung up on the social media scene. These organizations offer NGOs a way to extend the already successful strategy of soliciting microdonations. Furthermore, mobile phone donations and text2giving microdonations have become popular in developing countries.

Participation Facilitation and Information Dissemination

One of the major barriers to NGO participation is time and travel investment. With the Internet, particularly social media, this barrier has been considerably lowered. Interested individuals can “like” a Facebook page and NGO updates start

pouring in. In addition, NGOs are successfully using Twitter as a way to keep their stakeholders engaged and motivated. NGO causes are no longer limited by national borders; they can now draw on an international audience, and involve them on a daily basis. Both Greenpeace and the World Wide Fund for Nature (WWF) have over a million “likes” on Facebook alone, and actively use this platform to promote and facilitate their “members.”

It is not the NGOs alone that facilitate participation for their stakeholders. A new kind of social network is emerging on the Internet that serves to connect individuals with NGOs. In Canada, Charityvillage.com provides an NGO database, Web pages for NGO profiles, and listings for volunteers and donations.

NGOs have been able to use the Internet as an effective information dissemination tool over the last decade. However, social media add an additional element of immediacy, interactivity, and the possibility of cross-linkages. Stakeholders no longer need to visit an NGO's Web site and search for the latest data, action items, or updates. NGOs can showcase current research, facts, and advocacy campaigns through microblogging and podcasts, as well as social bookmarking. This kind of selective sharing and highlighting of information also has the opportunity to go viral because social network users frequently repost and share updates from their news feeds.

Community Building and Management

Social media also offer NGOs effective and expansive community management opportunities. Stakeholders often use NGOs' social media posts as starting points to engage with NGO representatives and other community members, thus building a sense of belonging and camaraderie. Individuals can also repost text, photos, and videos within the social network, to other networks, or on their own blogs to show their affiliation and support of an NGO. Online social networks are also used to facilitate offline connections among stakeholders, so that social media can be used to connect people in the same geographical region.

Social media not only allow NGOs to connect with their audiences, but also with other NGOs. The primary sources for NGO-NGO outreach are emerging niche networks like jumo.com and wiser.org that allow NGOs to connect with other NGOs. Donor agencies also maintain substantial and active online presences that provide another avenue for NGO representatives to connect and relate to each other.

Furthermore, social media in all its forms provide previously isolated NGOs with the opportunity to connect with other NGOs in their field of activity. This is particularly true of NGOs operating in countries with oppressive regimes and/or oppressive communication policies. In addition, the viral features of social media have been used quite successfully by NGO activists to spread information and activate support. This is particularly crucial in times when an NGO's representatives and stakeholders might be in jeopardy themselves.

Social Media Challenges

While social media have brought much opportunity to NGOs, they have also brought new challenges. One of the most significant is that social networks allow populations to be self-organized. Movements in Pakistan, Iran, and the Middle East were largely initiated and sustained by individuals using social media. The NGOs in these countries were largely bypassed by the masses in favor of spontaneous organizing initiated and maintained by a core group of individuals. This phenomenon is replicated, albeit on a less dramatic scale, across the global public sphere. People are using social network groups and niche networks to connect, organize, and interact with other individuals. This need not spell doom for NGOs; rather, it can be seen as a need to refine strategy and adapt to the new role that social media has created for them.

The digital divide continues to be an issue for NGOs. While in the United States, 89 percent of nonprofits are using social media, the number is much lower for international NGOs. These organizations, particularly NGOs in those areas of the world requiring the most attention, continue to find challenges in affording the tools necessary for participation in the social media space. It is not only NGOs that are affected; stakeholders are also affected. Social media adoption rates are quite high for stakeholders belonging to developed countries and for upper income populations. However, key NGO populations continue to remain off the Internet and social networks. This will continue the conversation in the NGO community regarding the north-south divide, as well as proportional representation of disadvantaged communities in the global public sphere.

Nonprofit Organizations

A nonprofit organization (NPO) is an organization that uses revenue for social aid without a profit motive. NPOs operate to benefit the general public or specific groups. Examples of NPOs include charitable organizations, advocacy groups, religious organizations, professional/trade associations, political organizations, and several others. The goal of NPOs is to provide support to a key public through campaigns that stimulate public interest, recruit and maintain volunteers, and raise money.

In order to achieve these goals, NPOs are continually seeking outreach opportunities. Recently, NPOs have shown interest in social media outlets such as Facebook, Twitter, and YouTube for

public outreach. Although NPOs currently lag behind others in social media adoption, they have recognized the widespread use of social media and seek to utilize this medium. This entry will explain the perceived benefits and drawback of NPOs' use of social media, including discussion of cost effectiveness, image transparency, information dissemination, reaching stakeholders, and building relationships.

Cost Effectiveness

Like other organizations, NPOs find the inexpensive nature of social media appealing. However, implementation of social media has proven not as cheap as initially thought. Staff limitations present one obstacle prohibiting adoption of social media by NPOs. Large-scale social media efforts require a staff and constant monitoring, updating, and responding. It is necessary to designate individuals with the responsibility of performing these tasks and maintaining overall standards for content addition. NPOs experience more difficulties when attempting to use multiple platforms because they tend to have smaller staffs, budgets, and resources. Additionally, those tasked with implementation need some guidance and support as they adopt social media.

Image Transparency

Social media can be an effective way for NPOs to maintain an open and transparent online image. Many NPOs appear to understand the importance of disclosure as they tend to be open and transparent in their use of Facebook. In fact, the use of social media allows NPOs to directly communicate with the media while pushing the message beyond traditional gatekeepers. The ability for quick information scanning afforded by social media allows NPOs and traditional media outlets to monitor one another. As such, NPOs can communicate directly with the media while also allowing the media to monitor the organization and contact it for stories.

The ability to maintain an authentic interactive presence is a valuable asset to NPOs because it can lead to an enhanced public image. NPOs appear to put a lot of effort into managing their images and making a good impression in social media. However, when NPOs lack the resources to effectively maintain their social media presence, they

also fail to keep a consistent identification, which can be detrimental.

Information Dissemination

NPOs have utilized social media to disseminate information to their key publics, the broader community, and the media. NPOs appear to understand the benefits of using social media to spread news, educate the public, get issues on the public agenda, distribute press releases, and ultimately add to the information distributed through traditional media. Social media outlets have also been used to distribute polls and e-petitions, promote events, and otherwise notify potential donors and volunteers.

The information that NPOs share through social media should be relevant, timely, and of mutual concern to the organization and its stakeholders. As such, Twitter is quickly becoming a popular outlet for these organizations. Unfortunately, NPOs are not yet effective at using all types of social media for the distribution of organizational information. In fact, less than a quarter of NPOs actively publicize Facebook and Twitter pages on their Web sites.

Stakeholder Relationships

Reaching stakeholders is a necessary task for NPOs, and is a primary reason why NPOs use social media outlets. This is especially important to NPOs because social media can be potentially used to communicate with target audiences, despite a lack of staffing and resources. Social media provide NPOs with another medium through which they can build relationships with key publics on a topic/issue of mutual interest. Social media also allow organizations to deepen existing relationships with stakeholders through two-way communication, which can cultivate long-term relationships.

NPOs are unique in their reliance on donors and volunteers. As such, relationship building among an organization and these groups is an important task that can now be facilitated through social media. Social media, especially Facebook and Twitter, are now considered a good medium to recognize volunteers and fundraise. For example, Facebook provides an online space where volunteers can share the tasks associated with managing and promoting an organization's

efforts. Engaging stakeholders can be useful to NPOs; Facebook and Twitter have proven to be beneficial methods for NPOs to gain public feedback. For example, Twitter has provided public conversation and conflict resolution. Social media outlets also have great potential for offering forms of two-way communication, such as polling opportunities, extending invitations for offline interaction, participating in forums, and signing e-petitions.

Although NPOs are taking steps to use the social media environment to create dialogue with stakeholders and to build relationships, they have not yet taken full advantage of their abilities to aid in relationship cultivation. Additionally, NPOs are currently failing to capitalize on the interactive and multimedia capabilities of social media. Volunteers can play a key role in the positive promotion of an organization by sharing multimedia content. However, this requires that NPOs put effort toward the development of relationships by involving volunteers. Furthermore, NPOs have failed to capitalize on the full potential of social media outlets because they fail to provide methods for supporters to become more involved.

Social Media Implementation Problems

As noted above, NPOs have several obstacles to overcome. One of the biggest relates to implementation and leadership. Staff limitations are a hardship faced by NPOs. Older volunteers have expressed reservations about using social media, and the task of implementing social media is often designated to an existing employee or a young intern/volunteer because of their technological knowledge.

Adoption of social media has also been hindered by the learning curves of those tasked with implementation. Employees and volunteers reportedly lack guidance from superiors and face internal barriers of control. The use of social media is more likely to occur in organizations that offer facilitating conditions and resources, usually in the form of a public relations department.

NPOs have also failed to directly engage with their publics through social media. There is a need to proactively participate in the social media context. However, NPOs do little to foster a two-way

flow of communication, and tend to use social media in a traditional one-way flow. For example, NPOs tend to use Twitter to convey one-way messages, rather than to facilitate dialogue or build relationships. This means that NPOs are not utilizing opportunities to engage in conversations, respond to comments, or answer questions, even though context allows for dialogue and relationship building. The failure of NPOs to utilize the interactive potential of social media results in an inability to use this context to generate meaningful communication with key publics.

Planning and Recommendations

NPOs desperately need enhanced guidance, time, and resources to utilize the full potential of social media. The impact of using social media is greater when it is carefully planned, goals are predetermined, and several outlets are utilized as part of a multiplatform strategy. Campaign planning is crucial for NPOs to achieve predetermined goals. Planning should consider strategies to support the development of long-term relationships.

A multiplatform strategy allows NPOs to interrelate information across online spaces. A multiplatform strategy can be as simple as using Facebook and Twitter alongside a traditional Web site. This allows organizations to utilize the unique capabilities offered by the different social media platforms available. For example, NPOs utilize Facebook more than any other form of social media and have found it to be a good medium to communicate a transparent image and generate discussion. The short, compact nature of Twitter has been found to help NPOs promote and distribute new information to potential donors and volunteers. Additionally, there are benefits of using YouTube and other media sharing sites. Using the informal environment of social media in conjunction with a more formal Web site is also beneficial for NPOs.

Finally, engaging with publics through these online spaces is a necessary task of organizations that use social media. NPOs can effectively increase their engagement by providing updates, directly interacting with publics, encouraging participation, and distributing new information, especially multimedia content. This can be accomplished by making a concerted effort to respond to public feedback, communicate a transparent

image, post frequent updates, and provide a wide array of multimedia content.

Obama for America iPhone Application

With less than 100 days remaining until the 2012 presidential election, Obama for America released its mobile application (app) for the iPhone. The app marked the first time that a presidential campaign created a program that accelerated, aggregated, and customized the flow of resources and information between the different operations of a national political campaign for use on a mobile device. However, the invention of the Obama for America iPhone app also raised questions about the distribution of an app that provided publicly available personal information with minimal oversight.

The Obama mobile app turned mobile devices into a powerful tool for political campaigns by centralizing canvassing and fundraising innovations developed by the Obama campaign. For the 2008 Democratic primaries and presidential campaign, Obama for America launched My.BarackObama.com (MyBO), the first national campaign social-networking site. Built on the architecture and philosophy behind Facebook, MyBO allowed supporters with computers and Internet service to connect with other supporters, call potential voters, organize into groups, plan events, fund raise, and access campaign and election resources.

MyBO included the “Neighbor to Neighbor” initiative, a program that allowed volunteers to use their home computers to print out lists of names and addresses of potential voters to contact in a location of their choice. The Obama campaign also started using mobile devices in its fundraising, creating “text-to-give” fundraising programs, and using texting as a way to communicate with supporters and with each other. At the end of the election, MyBO and texting had grown into a sophisticated hub that raised \$30 million, held the information of 2 million profiles, and organized thousands of events and groups.

Organizing for America

Elements of the 2008 Obama presidential campaign merged with the Democratic National Committee to create Organizing for America (OFA), an initiative that used the Obama for America infrastructure to encourage political activism in support of the Obama administration and the Democratic Party. On June 23, 2010, OFA released its app for the iPhone. The OFA iPhone mobile app was the first step in moving campaign operations onto mobile practices. The OFA app performed all the same functions of MyBO—it provided supporters with resources about issues and events, ways to share information across social networks, and ways to donate—and added a function to call a constituent’s representative in

Congress to encourage congressional support for the Obama administration.

In advance of the 2010 midterm congressional elections, OFA released an update of its app to include canvassing tools. The canvass app provided voter lists and interactive maps, information about the issues and candidates, and a way for supporters to report information about their contacts—such as location, number of contacts made and their political orientation—to OFA field offices and OFA headquarters. In 2008, Obama for America field offices and volunteers performed the same canvassing tasks, but the impact was slowed by the time it took to process information from the field; the iPhone app eliminated the lag between recording information on clipboards and printed lists, and entering the information into the OFA system.

Obama for America

The outcome of the 2010 midterm congressional elections led to gains for the Republican Party in Congress, but the OFA canvass app showed how a political campaign could load its operations onto mobile devices; the challenge was to take the app to scale. For a presidential re-election campaign, major challenges included the reengagement of supporters from the previous presidential election, the recruitment of new supporters, tailoring information and services based on the location of a supporter to streamline engagement, and providing reliable data for the campaign to assess the state of the race and help make decisions in the distribution of resources.

With the Obama for America mobile app, supporters could access important information related to their state as determined by their IP address or zip code. For example, supporters could learn how to register to vote and receive information about voting guidelines, and they could receive a list of voters to contact in their area, and armed with a script, they could contact a voter and evaluate his or her intentions on election day. This data allowed the Obama for America campaign to determine follow-up actions in their canvassing efforts, including the kind of engagement required to mobilize the voter and determining the resources required in the area.

All the information gathered and provided by the Obama for America mobile app was available

from public sources. The tactics and data being used by the campaign was the same kind of data and tactics used by marketing and advertising campaigns and by social media platforms like Facebook and search engines like Google. However, privacy advocates expressed concern over the unprecedented aggregation of political data and its use in the future: Anyone could access this information via the app and the question remains unanswered, what will happen to the personal information collected by the campaign?

Also available for Android devices, the Obama for America mobile app proved an essential tool for political campaigns, but the future of the app has yet to be determined. Will the Obama for America mobile app and its information be shared with candidates across the Democratic Party? Or will the mobile app be retired and replaced by a newer version engineered by the team behind the next Democratic presidential candidate?

Occupy Movement

The Occupy movement is a protest movement focused on social and economic inequalities. Inspired by world events such as the Arab Spring, the Spanish Indignants protests, and the subprime mortgage crisis in the United States, the Occupy movement brought international attention to the economic and power structures that it claims disproportionately benefit a minority of the population, are unstable, and undermine democracy.

The Occupy movement began unceremoniously in mid-July 2011, when the Canadian-based group Adbusters Media Foundation posted a blog post proposing a peaceful occupation of Wall Street to bring attention to growing wealth disparity and the influence of corporations on democracy. The hashtag #OccupyWallStreet was retweeted by a few Twitter users over the next two months, and the idea, while provocative, was slow to gain traction. The movement's message gained substantial momentum on social and microblogging sites on September 16, 2011, the evening before the first organized Occupy Wall Street protest. Within 24 hours, #OccupyWallStreet represented one in every 500 uses of a hashtag on Twitter, a phenomenon credited to hyperlocal tweeters, individuals who cover the happenings of local communities in great detail.

The first visible protest of the Occupy movement was held at New York City's Zuccotti Park, also referred to as Liberty Plaza, on September 17, 2011, coinciding with the 10th anniversary of the reopening of trading on Wall Street following the September 11, 2001, attacks. On the evening of September 17, Adbusters posted "A Modest Call to Action" on the movement's Web site, occupywallst.org, calling on like-minded individuals to engage in a revolution of the mind, as well as the body politic, through protests organized to disrupt the system. The movement quickly grew, spurred on by other organizations such as the Internet hacking group Anonymous,

which encouraged its followers to take part in the protests. By October 5, the demonstration in New York City had grown to an estimated 15,000 protesters; by October 9, Occupy protests were occurring in over 95 cities in 82 different countries; and by October 29, there were an estimated 2,300 Occupy protest zones worldwide.

The Occupy movement prompted spinoff movements such as Occupy Homes, aimed at helping homeowners who had lost their homes because of perceived illegal banking practices; Occupy Your Block, linking Occupiers to local community organizations; Occupy Colleges, charged with educating the public about concerns related to mounting student debt; and Bank Transfer Day, which urged Americans to leave corporate banks in favor of community credit unions.

Touting slogans such as "We Are the 99 Percent," "Main Street, Not Wall Street," "Foreclose on Banks, Not People," and "Occupy Everything," and capitalizing on the extensive reach of social media, the movement quickly gained supporters and spawned movements across the world. To date, the Occupy movement has seen protests on every continent except Antarctica, and is regarded as an important global movement symbolizing the reinvention of politics in the 21st century.

99 Percenters

The most pervasive mantra used by the movement was "We Are the 99 Percent." This slogan, proposed on a social-networking site, indirectly referenced the concentration of wealth among the top 1 percent of income earners. The movement contended that the bottom 99 percent were charged with paying for the financial mistakes of the top 1 percent, referencing the mortgage and banking crises of the late 2000s, and frequently asserted that billions live in poverty, whereas the rich control a majority of the world's assets. The movement stressed that existing political systems are highly influenced by the 1 percent, and advocated for the creation of alternative political structures focused on direct action and direct democracy.

In the early stages of the movement, it was assumed that the 99 percenters were comprised of mostly students, the unemployed, and Democrats. However, research conducted by a variety

of organizations and academic institutions challenged these assumptions. The majority of the protesters were white and male, with an average age of 44.5 years old, most were college educated and employed full time, and were not affiliated with a political party or were independent voters. Over half of the respondents voted for President Obama, with nearly three-quarters unhappy with his performance, and nearly all respondents disapproving of how Congress handled its responsibilities.

Leaderless Movement

The Occupy movement focused on embodying the ideals of participatory democracy and demonstrating an overriding commitment to democratic processes. While critics of the movement focused on the lack of a centralized leadership, protesters instead saw this as echoing the larger ideals of the movement, that no one person's opinion or status was more important than that of another. Occupiers collectively negotiated all decisions via meetings of the General Assembly, a horizontal, leaderless, autonomous, de facto decision-making body. During the General Assembly, people were informed of the findings of multiple working groups, assemblies that performed much of the day-to-day work and organization for the movement, and any protester had the right to speak. A consensus model of direct democracy, which featured the use of hand signals and discussion facilitators to increase participation, allowed every protester to have an equal voice in the decision-making process.

Members of the movement embraced consensus decision-making methods that allowed the General Assembly to stay true to the mission of promoting every member's issues and representing the will of the people. The egalitarian process functioned both procedurally and substantively to provide members a high level of satisfaction regarding decisions. Occupiers believed that people would lead by example, step up when needed, or step back when appropriate, and emphasized that the movement was not leaderless, rather it was leaderful.

The commitment to consensus-based decision making produced some challenges. The ability for anyone to speak out during the General Assembly often resulted in many divergent

opinions and agendas voiced, causing the meeting to lose effectiveness. In order to ensure that members of marginalized groups were heard, Occupy Wall Street developed a process called a progressive stack. This system allowed women and minorities to speak with facilitators before members of the dominant group; this was criticized for violating the principle that everyone's voice was equal, and for forcing equality. Concerns also arose that the working groups' focus on separate causes resulted in the dilution of the movement's larger initiatives. As the movement developed, members began to worry that it was becoming fractured, with its center of gravity devolving into smaller groups with different agendas and objectives.

Goals of the Occupy Movement

The Occupy movement was heavily criticized for its lack of a central focus or demand. During the early stages of the movement, a myriad of alleged goals were put forth by demonstrators. The goals included a broad range of issues, including more and better jobs, bank reform, and to initiate global changes against capitalism and austerity measures. Additional concerns that were frequently highlighted included the political influence of corporations, social and economic injustices, rising student and household debt, foreclosures, and limited prospects for graduating college students.

As the movement developed, more specific and loftier demands were put forth. Touting the slogan, "Democracy Not Corporatocracy," these demands included a mandate that President Obama convene a presidential commission charged with ending the relationship between money and political representatives in Washington, D.C. Other goals included a broad tightening of banking-industry regulations, the banning of high-frequency trading, and the arrest of everyone involved in the financial crash of 2008. There was also a "99 Percent Declaration," developed by a working group in New York City, which called for the creation and implementation of a system of public financing for political campaigns, a ban on all monetary and gift contributions to politicians, and the repeal of the Citizens United decision by the Supreme Court via a constitutional amendment.

In addition to multiple goals and demands, the movement had shifting goals. In October 2011, Adbusters began forwarding the agenda for a “Robin Hood Tax,” or a tax on the financial sectors, and focused much of the movement’s attention on a global march in support of the tax. By December, many occupiers had begun to focus their attentions beyond the protest camps, and instead on the projects of the working groups, such as Occupy Homes, and focused more on the need for banking reform, and less on engaging with mainstream politics. What many thought would be heralded as a new political and social dynamic, brought about by a transformation of civic engagement and political participation, got seemingly lost in the plurality of voices of the movement. Critics asserted that the overarching theme and message of the movement was not coherent, and suffered from a lack of unifying purpose and voice. Protesters countered by declaring that the unifying concern, the corrupting effects of money on politics, was evident, and that issuing demands would have served to legitimize the political and power structures the movement sought to challenge.

Commitment to Nonviolence

Essential to the movement were nonviolent occupations of major cities and towns across the world; throughout the demonstrations, nonviolence remained a core strength of the movement. While a majority of the protesters abided by their pledge of nonviolence, there were instances of violent interactions between occupiers and the police broadcast throughout the mainstream media. In September, a video of peaceful female protesters sprayed with pepper spray by a police commander gained significant coverage, and helped to bolster the movement’s focus on nonviolence. However, later reports by media outlets regarding the increase of violence among protesters, including allegations of sexual assault and videos depicting physical clashes between demonstrators and police, served to depict the movement in a more aggressive light.

Occupy and Social Media

The Occupy movement mobilized thousands of people around the world, exclusively through the Internet. The decentralized and ostensibly leaderless nature of the movement made the use

of Internet technologies ideal because its growth spread virally, from person to person, and not from a central authority. Occupy Wall Street (OWS) successfully and effectively utilized social media to translate online support into offline presence and activism. Social media platforms were instrumental in recruiting and linking supporters, acquiring necessary resources for local occupations, distributing information, creating and managing local encampments, and organizing protests and marches, storytelling, and across-group exchanges.

While multiple social networking platforms were used across OWS, the most prominent was Facebook. Over 450,000 Facebook users joined the more than 400 Occupy-related Facebook pages; these pages included Wall Street Occupation pages, national pages (efforts to symbolically occupy national institutions), state or regional pages, and local pages. On these pages, more than 170,000 people posted or commented more than one million times (a number that does not include people who only “liked” or “shared” a post). Users tended to first be active on local pages, and then matriculate to national pages; 40 of the 50 Occupy pages with the largest number of active users were local pages. The concentration of Facebook activism was most notable in college towns and state capitals, with online participation lowest in the south.

Twitter was also instrumental in broadcasting on-the-ground details of OWS events. Twitter traffic was heavily driven by significant events, such as when over 700 individuals were arrested on the Brooklyn Bridge, and on October 15, when hundreds of protests were held around the world. Usage of #OWS and #Occupywallstreet, the two most common hashtags associated with the movement, spiked during events during which there were police–protester interactions. Because Twitter’s interface is specifically suited to highlight current events, it was a valuable platform through which dramatic, compelling, and newsworthy video footage could be instantaneously tweeted to the world.

Videos and images captured and shared through social media were important to the movement because they were frequently picked up by the mainstream media. The OWS movement is an interesting example of the evolving

relationship between social and mainstream media. Although the OWS movement was successful in its goals via social media, it still needed the mainstream media's circulation of vivid pictures and videos to increase the knowledge and legitimacy of the movement. While a movement may be powerful in a social media environment, it still often needs the power of the mainstream media to help gain validity.

Political and Social Impact

Critics of the Occupy movement contend that it had little collective political or social consequence. Yet, supporters believe that the movement made a global impact through altering the terms of the political debate and substantially boosting media coverage of the crises facing citizens worldwide. The movement was mentioned often at the 2011 G20 summit, and in policy responses related to

the financial crisis of the late 2000s. It was also paramount in shifting mainstream media coverage in the United States from narratives about the federal debt and deficit to issues of unemployment and unequal income distribution. The movement also brought national attention to the current U.S. tax system, which a 2011 Congressional Budget Office report noted was partially responsible for income inequality. In November 2011, U.S. Congressman Ted Deutch introduced the OCCUPIED (Outlawing Corporate Cash Undermining the Public Interest in our Elections and Democracy) constitutional amendment, aimed at overturning the Supreme Court's Citizens United decision, which in part would ban corporate money from the electoral process, a primary concern of the Occupy movement.

References to income inequality became more prevalent in worldwide political discourse, with former Vice President Al Gore calling on activists to "Occupy Democracy," noting that the political system no longer served the best interest of the electorate. President Obama spoke in support of the movement, acknowledging that the occupations were a sign of the collective frustrations of the American public. It was also widely suggested that the movement influenced President Obama's 2012 State of the Union address, and created an opportunity for Obama to speak about the wealthy paying a greater share of the national tax burden. Although Obama stopped referencing the movement by name, income inequality remained a central theme during his 2012 re-election campaign.

While the tangible political impact of the Occupy movement may not be considered significant, the widespread social implications appear more impactful. The movement generated national conversation regarding the economic problems faced by a vast number of Americans, including unemployment, heavy student loan and personal debt burdens, and social issues such as homelessness and health care deficiencies. References to income inequality, which were not commonplace prior to the movement, proliferated in mainstream print and broadcast media, the terms "1 percenters" and "the 99 percent" became prevalent throughout popular culture, and the word "Occupy" became the most common word on the Internet and in print in the 12-month period following the outset of the movement.

Organizers on September 25, 2011, during the ninth day of Occupy Wall Street in Zuccotti Park in lower Manhattan. Over 450,000 Facebook users joined Occupy-related Facebook pages, on which over 170,000 people posted or commented.

Support for the movement was voiced from around the world, by prominent figures such as Jesse Jackson, who reminded demonstrators that Gandhi and Martin Luther King, Jr., were also “occupiers,” and wealthy supporters joining the movement with slogans such as “We Stand with the 99 percent” and “I am the 1 percent—I stand with the 99 percent.” A January 2012 global survey of 23 countries, published by a global market research firm, indicated that around 40 percent of worldwide respondents were familiar with the Occupy movement, and over twice as many reported a favorable opinion of the movement than a negative one. The movement also resulted in the forming of the Coalition for the First Amendment, organized by journalists in New York City in response to perceived constitutional violations on the part of the police during the NYPD’s eviction of Occupy Wall Street protesters from Zuccotti Park.

The movement also generated a palpable negative social response, with politicians and pundits often characterizing protesters as a growing mob seeking government handouts, and one-time presidential candidate Herman Cain even calling the occupiers “anti-American.” Advocates of the movement attribute a portion of the negative social perception to the mainstream media’s coverage, which was scant and largely dismissive. The movement received very little media attention between the start of the protests and September 24, 2011, when the first organized march into uptown New York City resulted in the closure of several busy streets and the arrest of 80 demonstrators. Mainstream media consistently characterized the Occupiers as a marginalized group, specifically highlighting violent interactions between protesters and police, although these exchanges were not common, and focused on the financial impact of the movement upon cities.

Future of the Occupy Movement

There is uncertainty about what the future of the Occupy movement holds, or whether it was ever even a movement to begin with. Various organizing factions are coordinating different agendas, and many demonstrators are looking beyond the Occupy label that some feel has boxed in the movement. The emerging ad hoc leaders are considering plans to help propel the movement

beyond its initial excitement, and potentially build an infrastructure that will sustain the movement beyond the occupations. The movement continues to evolve and diversify its messages to reach different audiences that it believes are a critical part of the 99 percent.

Whether or not the movement will adopt any concrete agendas is uncertain because the organic and extemporaneous nature of the movement lacked a hierarchy of leaders that may have been necessary to develop and sustain the movement. The Occupy movement provided an opportunity for hundreds of thousands of people worldwide to engage in participatory democracy. Although the impact on political policy has thus far been minimal, the future of the Occupy movement is yet to be defined, and has the potential to grow into a galvanizing political force.

Office of Government Information Services

The Office of Government Information Services (OGIS), created in 2007, acts as a Freedom of Information Act (FOIA) ombudsperson by mediating, in situations of contested FOIA requests,

between FOIA requesters and the federal agencies from which the request for information has been made. The FOIA, enacted in 1966, provides that American citizens have a legally enforceable right to obtain access to any federal agency information, provided that such information does not fall under any of the several exemptions from public disclosure. Thus, the FOIA represents an accountability mechanism that ensures the transparency and openness of the government. Although one of the purposes in the creation of OGIS was to assist information seekers by creating an alternative avenue to lengthy and costly litigation in cases of agency noncompliance with FOIA requests, it remains to be seen to what extent OGIS will be able to improve agency response to FOIA requests and provide a meaningful complement to FOIA litigation.

History and Purpose

The OGIS was established by the Openness Promotes Effectiveness in our National Government Act (OPEN Government Act) of 2007 (Public Law 110-175), a bipartisan initiative of U.S. Senators John Cornyn (R-Texas) and Patrick Leahy (D-Vermont), as part of the National Archive and Records Administration (NARA). The Open Government Act of 2007 represented one of the most comprehensive overhauls of the FOIA since the Electronic Freedom of Information Act amendments of 1996. Some of the FOIA amendments passed into law included the creation of a tracking system for FOIA requests, a FOIA hotline service for all the federal agencies, and a mandatory position of chief FOIA officer for each agency tasked to monitoring agency compliance with FOIA requests; the extension of the fee waiver for FOIA requests to Internet bloggers and other Web-based journalists; and the establishment of financial penalties for federal agencies missing the FOIA's 20-day statutory deadline or rejecting requests in an arbitrary and capricious fashion.

Additionally, the bill closed a legal loophole that allowed federal agencies to delay compliance with FOIA requests during litigation until just before a court decision favorable to the FOIA requester. The purpose of this delaying tactic was to trigger the Supreme Court ruling in *Buckhannon Board and Care Home, Inc. v. West Virginia Dept. of Health and Human Resources*, 532 U.S.

598 (2001), which would have precluded FOIA requesters from recovering attorney fees from the agencies that denied their request. The bill clarified that FOIA requesters actually had a right to recover attorney fees in that situation, provided that the requester's claim was legitimate.

However, Congress also found that FOIA litigation, even if attorney fees were recovered, was cost prohibitive for a FOIA-requester. To address this shortcoming, the Open Government Act established the OGIS to (1) review the FOIA-related policies, procedures, and compliance of federal agencies; (2) conduct audits on and publish reports about FOIA compliance among administrative agencies; (3) issue FOIA-related policy recommendations to Congress and the president; and (4) offer mediation services between FOIA-requesters and federal agencies as an alternative to litigation, as well as issue advisory opinions in case of unsuccessful mediation. Thus, the purpose of the OGIS was to function as an ombudsperson for FOIA requests, mirroring at federal level some state-level successful alternatives to FOIA litigation, such as the New York Committee on Open Government.

The stated purpose of placing the OGIS with the National Archive and Records Administration (NARA) was to free the OGIS from the influence of the Department of Justice (DOJ), which oversees agency compliance with FOIA directives and acts on government's behalf in FOIA disputes. However, five weeks after the OPEN Government Act was signed into law, in his fiscal year 2009 budget proposal sent to Congress, President George W. Bush sought to transfer the functions of the OGIS from NARA to the Department of Justice. The administration argued that the proposed functions for the OGIS would duplicate the activities already performed by the DOJ.

However, the argument was considered controversial by open government organizations (including the American Civil Liberties Union, American Library Association, Electronic Frontier Foundation, National Freedom of Information Coalition, and the Sunlight Foundation) and by both the House and Senate Appropriation Subcommittees because the OGIS transfer to the DOJ was seen to directly contradict the mandate of the OGIS as an independent mediator between FOIA requesters and governmental agencies. The OGIS was

eventually restored to NARA with an appropriation of \$1 million, and opened in September 2009.

Since 2009, the seven-person OGIS agency assisted in nearly 2,100 FOIA-related instances, and offered suggestions to 17 federal agencies. OGIS success in submitting policy recommendations to Congress is less clear. Although the OPEN Government Act mandated the OGIS to issue policy recommendations to Congress meant to improve FOIA-related agency compliance, OGIS did not do so until 2011. In 2011, recommendations were submitted to the Office of Management and Budget (OMB), but the OMB created additional controversy in Congress by failing to forward the OGIS recommendations to Congress for review. In 2012, the OGIS recommended the improvement of FOIA along several dimensions, including facilitating information sharing among agencies, improving the online tracking of FOIA requests, coordinating multiagency responses to FOIA requests, and improving the dispute resolution skills of FOIA professionals. In 2013, the OGIS will be working on examining FOIA fees, which continue to remain a contentious issue for FOIA requesters, and recommending policies to ease up the backlog of cases created by immigration-related FOIA requests by non-U.S. citizens.

OhmyNews

OhmyNews is one of the most popular Internet newspapers in South Korea. It was founded by Korean journalist Oh Yeon Ho in 1999, and was officially launched on February 22, 2000. His idea was to establish a citizen-participatory alternative Internet newspaper. The site's name is derived from the comedic catch phrase "Oh my God!" that was popular in Korea at the time. The slogan of OhmyNews is "every citizen is a reporter." OhmyNews provides a public platform to a large number of citizens who had previously not been represented in the media. The site covers all kinds of news, ranging from politics, society, international affairs, education, business, information technology, sports, and entertainment. OhmyNews is widely considered one of the most influential news organizations in South Korea. The South Korean weekly magazine *Sisa Journal* ranked it several times as one of the top 10 South Korean media organizations, evaluating newspapers, TV and radio stations, as well as print magazines.

Role in Politics

OhmyNews played a major role in the presidential elections of South Korean President Roh Moo-Hyun in 2002. It provided an alternative news source to the mainstream media. OhmyNews not only served as a news source in the presidential election, but also as a hub for political mobilization and social change. After the election, President Roh Moo-Hyun granted his first interview to reporters of OhmyNews. OhmyNews also played an important role regarding the reporting of a traffic incident in 2002 involving the U.S. military, which resulted in the death of two teenage girls and led to political protests. While Korean mainstream press provided little information on the subject, OhmyNews triggered debate on America's military role in the country.

Citizen Journalists

The alternative Internet newspaper finances itself primarily through commercial advertising. It announced that the company became profitable in 2003, but its business model appears unstable. Mostly young, male, well-educated, and progressive-thinking people constitute the reader and

reporter membership. OhmyNews differentiates between citizen and specialist reporters. Citizen reporters claim their roles by formally registering as members before they are allowed to submit articles. Specialist reporters are employed on a full-time basis by OhmyNews to select and examine the news coming in from citizen reporters. That way, only a selection of submitted items is authorized as OhmyNews articles.

OhmyNews started with 727 citizen reporters who supplied articles. This number increased steadily to 14,000 in 2001, and to more than 40,000 in 2006. All OhmyNews citizen reporters have to provide a profile, and they have to agree to abide the reporters' ethics code and regulations. Articles from citizen reporters comprise the bulk of OhmyNews content. The contributions amount to 150 to 250 articles a day. The OhmyNews model includes monetary incentives for citizen reporters. If a reporter's article is published in OhmyNews, he or she can receive a small sum of money, depending on whether the article appears on the site. Additionally, readers can "tip" citizen reporters by sending money online or by cell phone. These payments serve more as encouragement than income for the reporter.

In order to be able to compete with the traditional Korean press, OhmyNews has been cultivating the professionalism of its "guerrilla" or citizen reporters. A citizen journalism school was opened in November 2007 on the outskirts of Seoul to act as a collaborative knowledge center, developing new citizen reporters. OhmyNews has published hoaxes, and faces a problem of undisclosed conflicts of interest. The editor filtration system tries to prevent such behavior, but has not been able to fully succeed.

OhmyNews emerged as a response to specific historical, social, and cultural conditions. The increasing differences between different generations and a longstanding skepticism toward conservative mainstream media played a major role. Three traditionally conservative daily newspapers (*Chosun Ilbo*, *Don-A Ilbo*, and *Joong Ang Ilbo*) had been covering around 80 percent of daily circulation for many years. There are various factors that play a crucial role in the success of OhmyNews. One of them is that the site attracted a new generation that grew up in a more affluent, high-tech society that was more dubious of

mainstream media. It also addresses issues largely ignored by established news organizations in Korea. Another important factor is the information technology infrastructure of the country.

OhmyNews relies heavily on Korea's sophisticated and extensive digital telecommunication infrastructure, which is a result of significant government-led policies. Since the mid-1990s, the Korean government has presented national goals for establishing a knowledge-based society. Since then, it has been pursuing a broad information and communication policy by implementing a series of mid- and long-term programs to fund the telecommunications infrastructure. Currently, Korea has one of the highest rates of overall Internet connectivity in the world. On August 28, 2006, OhmyNews started a Japan-based citizen-participatory journalism site called OhmyNews Japan, launched with the financial support of Softbank, a Japanese telecommunication and media corporation. It did not succeed. In July 2008, all staff of OhmyNews Japan was dismissed, and by the end of August 2008, operations had ceased on the site.

ONE Campaign

ONE Campaign is an international grassroots advocacy and campaigning organization aimed at fighting extreme poverty and preventable diseases in the poorest regions of the world, particularly in Africa, by increasing public awareness, lobbying global political leaders to take concrete actions, and working together with leaders in Africa to support democracy, accountability, and transparency in using international aid. According to the organization, its name was chosen because the word “one” symbolizes the idea of joining together antipoverty organizations’ forces. ONE Campaign officially started in 2004, as a project involving humanitarian and advocacy organizations such as DATA, Bread for the World Institute, CARE USA, International Medical Corps, International Rescue Committee, Mercy Corps, Oxfam America, Plan USA, Save the Children, World Concern, and World Vision. Moved by a common interest, these organizations joined forces to appeal to the U.S. government to increase its budgetary investment of one percent for the fight against extreme poverty.

The campaign held its opening event in Philadelphia, Pennsylvania, in May 2004. The cooperation among these organizations continued in 2005 with a series of benefit events around the world, in conjunction with the G8 Summit in Gleneagles, Scotland. Ten Live 8 concerts hosting different artists took place in Africa, Asia, Europe, and North America on July 2, 2005, just before the official start of the G8 conference and summit. This second social action succeeded in making G8 leaders commit to providing an additional \$25 billion in assistance to Africa by 2010. The collaborations between the ONE Campaign initiative and the organization DATA increased during 2007, and in 2008, the two merged to form ONE Campaign. The organization claims to have over 3 million members supporting its cause.

ONE Campaign is primarily funded by donations made by philanthropists, many of whom are on the board of directors. The board is made of 19 people, including cofounder Bono, the singer of the Irish band U2; Bobby Shriver, cofounder of the organization; Condoleezza Rice, 66th U.S. Secretary of State; Sheryl Sandberg, Facebook chief operating officer; Howard G. Buffett, son

of the famous American businessman Warren Buffett; and Morton H. Halperin, senior advisor at the Open Society Institute. ONE Campaign is managed by an executive team of 10 people with the former editor of TIME International, Michael Elliott, as president and chief executive officer, and cofounder of advocacy organization DATA and ONE, Jamie Drummond, as executive director.

ONE Campaign has offices in Belgium, France, Germany, the United Kingdom, the United States, and South Africa, but it mostly operates online and through viral activities. The organization leverages the use of social media to spread messages and information on diverse social issues, policy developments, and political discussions. ONE Campaign has a blog as well as Facebook, Flickr, and Twitter accounts, and a dedicated YouTube channel. Activists and volunteers around the world can post their pictures, videos,

ONE Campaign volunteers at a June 13, 2011, rally in London in support of a global project to increase children's vaccinations by 250 million a year worldwide by 2015.

and comments about events and activities that relate to ONE Campaign causes. Videos of celebrities endorsing ONE Campaign causes are also made available through ONE Campaign's YouTube channel. In addition to organizing different events and mobilizing public opinion, ONE Campaign provides policy analysis and information on the challenges and opportunities to tackle important social, economic, and political issues. The organization works with different national and international grassroots organizations on specific projects and actions, including issues such as clean water, education, hunger, trade, and preventable diseases. ONE Campaign is also one of the international organizations supporting global efforts to achieve the United Nations Millennium Development Goals by 2015.

While the organization claims not to be a celebrity campaign but a grassroots movement, many events and activities raising public attention see celebrities involved either directly as ambassadors or indirectly through donations and project-specific actions. Nonprofit and nongovernmental organizations, including international organizations such as the United Nations, have involved celebrities as ambassadors to endorse particular social causes. Because of their positions in the minds of consumers and the general public, celebrities are capable to move mass media and citizens' attention toward specific social and political issues, and by doing so, they increase public expectations toward global leaders' decisions and actions on those issues. For the same reasons, celebrities are often engaged in direct donations and fundraising activities. ONE Campaign claims that it does not seek to raise money for a specific cause, but that its mission is to advocate certain social causes, such as the fight against poverty, and to lobby for concrete political actions and commitments.

ONE Campaign has received some criticism on the actual use of donations it receives, confronted by allegations that in 2008, only 1.2 percent of donations were devolved to charity activities. The organization responded by explaining that it functions primarily as an advocacy group on behalf of fundraising activities, and does not run operational programs, thus asserting that a percentage spending charge is irrelevant as a measure of its efficiency. Other criticisms are more ideological; some scholars, such as David Nolan, claim that ONE

Campaign is an example of dehumanizing the poor and the commodification and individualization of poverty, especially through narratives that promote stereotypical representations of celebrities as northern rescuers, raising questions about the use of celebrities in humanitarian actions.

140ELECT.com

140ELECT.com is an Internet-based consulting service focused on the successful and effective implementation of Twitter in political campaigns. The service focuses on the integration of strategic and targeted Twitter initiatives that assist in engaging supporters, creating communities, and organizing fundraising. It works to track, analyze, and manage Twitter accounts to provide campaigns with actionable methods for effectively engaging prospective audiences, followers, and voters.

140ELECT Campaign Tools

Through programming tips and consultation, 140ELECT provides campaigns a distinct set of tools geared toward effective political tweeting. A primary focus of 140ELECT is using tactical management techniques focused on the strategic

deployment of tweets and the growth of Twitter pages to increase campaigns' effectiveness. Research, tracking, and metric tools analyze tweets both by and about candidates to identify tweets and hashtags (words or phrases prefixed with the symbol #) that appear to resonate with voters, recognize potentially influential supporters based on their followers, and help target active and potential supporters by state and city. These tools are designed to enhance campaigns' Twitter visibility and success by offering real-time metrics, tweeting advice, and alerts that enable rapid campaign response.

140ELECT also creates custom Twitter pages and engagement Web sites, and provides opposition research tools and alerts. Through custom Twitter pages and engagement Web sites, supporters can find and retweet (repost someone else's tweet) a campaign's most effective tweets, participate in town hall spaces, and engage in community building and fundraising. Opposition research tools provide real-time reports on tweets both by and about opponents, allowing campaigns to identify trending attack tweets and hashtags and to inject campaign messages into opponents' tweet streams (timeline of tweets listed in real-time order). These tools give campaigns the ability to rapidly and strategically respond to critical tweets about the campaign.

140ELECT Projects

During its involvement in the U.S. 2012 presidential election cycle, 140ELECT shifted from focusing exclusively on political and campaign analysis to designing initiatives around political advocacy as well. Through the facilitation of multiple projects, such as hosting the first-ever presidential debate on Twitter, creating unique campaigns for independent candidates, and developing tools like Donate Tweets, 140ELECT sought to increase political engagement.

Unite Blue, one of 140ELECT's political engagement projects, aimed to connect and energize the political left by making it easier for users to connect with like-minded individuals and organizations on Twitter. The site used advanced heuristics and artificial intelligence techniques to locate and centralize the most politically active progressive and Democratic-leaning tweeters. Through BlueRank, a ranking system that

analyzed Twitter accounts based on a range of issues, including the frequency of specific types of retweets and hashtags, users were presented with prominent Twitter accounts that they might want to follow. Subscribers to the free service could also have their Twitter accounts analyzed in order to receive a recommended list of Twitter accounts that they were not already following but may find interesting. Unite Blue users could select up to 50 accounts per day to follow, ask those accounts to follow them in return, and find Twitter accounts by state.

Other political engagement initiatives devised by 140ELECT included "2012twit," "Who to Follow," "Obama vs. Romney," and "Romney Attacks." 2012twit served as an election dashboard, providing real-time tracking of Twitter activity during the presidential election cycle. It monitored content such as candidates' total number of followers, mentions, unique mentions, retweets, and unique retweets in a 24-hour period. 2012twit also provided word clouds (visual representations for text data) highlighting trending words in reference to each candidate and hyperlinks that served as search engines for tweets on those topics. Who to Follow was a Twitter directory of the top Twitter accounts to follow during the 2012 election, Obama vs. Romney cataloged all tweets between @BarackObama and @MittRomney following the primaries, and Romney Attacks assembled popular tweet attacks on the candidate, provided easy verification of attack accuracy, and encouraged retweeting.

Conclusion

140ELECT was a prominent social media architect in the U.S. 2012 presidential election cycle. By offering tools and services that allowed for Twitter to be strategically integrated into campaign strategies and grassroots initiatives to increase political engagement, 140ELECT was integral in the prominent role that Twitter played in the 2012 presidential race.

100Reporters Whistleblower Alley

100Reporters is a community- and collaborative-centered global news organization specializing in investigative reporting on all types of corruption. It connects professional reporters with citizen journalists, citizen watchdogs and whistleblowers, and social and economic justice advocates and activists around the world. Because of the increased use of online surveillance tactics by repressive regimes to locate, torture, or kill human rights and anticorruption activists, 100Reporters created Whistleblower Alley, an online file exchange and communications point to securely and anonymously transmit information. In order to protect the reporters, activists, and advocates who are a part of the 100Reporters community, the organization created Whistleblower Alley so that those wishing to submit reports exposing corruption can do so as safely as is possible, using the infrastructure of the Internet.

As the Internet makes it difficult to silence ideas, information, and images entering a nation from outside it, authoritarian governments that have long controlled communication see a free flow of ideas and information as potentially destabilizing. Various legal protections safeguarding press freedom have increasingly come under attack from many regimes. Correspondingly, there is an intensified need to protect reporters, citizen journalists,

whistleblowers, and human rights advocates. In addition, online surveillance of activists, reporters, and whistleblowers is on the rise. WikiLeaks reveals the extent and sophistication of the more than \$5 billion online surveillance market.

Online surveillance, considered an "enemy of the Internet" by Reporters Without Borders, is used by repressive regimes to control and silence activists and dissidents through deep packet inspection, a highly intrusive technology that allows Internet service providers to monitor, filter, and suppress specific services or content. Officials from such regimes have openly acknowledged their attempts to track down and punish those who critique them. According to the Committee to Protect Journalists, "dozens of journalists; Syrian reporters, bloggers, and activists are regularly followed, arrested, and tortured. Ordinary citizens who came into contact with international journalists are also targeted." For example, one Syrian activist was caught by the national government's online surveillance efforts, and was subsequently arrested and tortured, reporting: "My computer was arrested before I was."

Whistleblower Alley uses various protective measures, including PrivacyBox.de, which allows users to submit files to a secure dropbox. Whistleblower Alley's secure message acknowledgment system uses anonymizing networks, such as the Tor network and the Invisible Internet Project, which defend against online surveillance and aggressive efforts to suppress free speech. Tor protects users by shifting computer-mediated communication around a distributed network of relays run by volunteers to circumvent censorship, and provide tools to evade direct monitoring by governments by preventing surveillance efforts from learning a user's geophysical location.

Whistleblower Alley has also published several pretty good privacy (PGP) public encryption keys, which allow anyone to submit secure messages using Whistleblower Alley's public key that can only be decrypted by 100Reporters. The public key (a series of letters and numbers) is for users who want to submit an encrypted e-mail message to the Alley. To enhance protection, the public keys are set to expire after a few months. Reporters Without Borders (RWB) has developed a similar secure Web site for submission of potentially sensitive reporting and information.

The organization argues, “If war reporters care about their physical safety, they take a helmet and bullet-proof vest when they venture into the field. Similarly, all journalists should equip themselves with a ‘digital survival kit’ if they are exchanging sensitive information online or storing it on a computer or mobile phone.”

RWB has an online survival kit on its Web site. The survival kit explains how to use Tor or virtual private networks (VPNs) for anonymizing communication, discusses the need to purge metadata from files, and offers advice on securing communication and data on laptops and mobile phones. RWB organizational founders argue,

Journalists and netizens must learn to evaluate the potential surveillance risks and identify the data and communications that need protecting in order to find appropriate solutions, preferably ones that are easy to use. The sophistication of the methods used by censors and intelligence agencies is testing the ingenuity of news providers and the hacktivists who are ready to help them. But the future of freedom of information depends on the outcome of this battle. This is a battle without bombs, prison bars or blank inserts in newspapers, but if care is not taken, the enemies of the truth may sweep the board.

Onion, The

As one of the finest comedic news organizations in the United States, since 1988, *The Onion* has gone from an obscure Wisconsin college newspaper to a far-reaching producer of humorous political content, both online and offline. From 1996 to the present, *The Onion* has charged into the digital world, playing a role in the political process with daily articles and commentaries, e-mail blasts, and starting in 2007, *Onion News Network* (ONN) online video sketches targeted for distribution through social media.

The Onion is perhaps best known for obscuring the lines between political fact and fiction for satirical effect. While typical news headlines might cover 2012 presidential candidate Mitt Romney’s wealthy upbringing, *The Onion* posted columns about, for example, “Romney Just Saying He Grew up Poor in Memphis Now.” The comedic publisher often creates headlines and material about major and minor subjects. Its original, trivial content is exemplified by its long-running series of what a nameless “Area Man” is up to, such as “Convenience of E-Mail Takes up 30 Percent of Area Man’s Work Day.” Yet, just as often, *The Onion* puts a humorous twist upon real political events and cultural trends through infamous headlines like “Drugs Win Drug War,” “Nation Shudders at Large Block of Uninterrupted Text,” or “U.S. Economy Grinds to Halt as Nation Realizes Money Just a Symbolic, Mutually Shared Illusion.” The search engine giant Google has also come in for its share of satirical treatment by *Onion* writers, both for its ability to peer into the private lives of Google search users and for its ability to dominate contemporary social media landscapes.

The Onion has remained true to its type of humor over the last 25 years, but its successful use of social media has been part of strategy of convergence and distribution between different platforms. The Webby Award-winning

theOnion.com boasted an average of 7.5 million unique visitors per month from about 40 million page views in 2013. The Web site is dedicated to newspaper content that is, as its producers assert, “delivered constantly, tweeted at optimum times and posted on Facebook during high-traffic periods. Subsequently, users can easily embed, share, or post articles and videos to their personal Facebook and Twitter accounts.” There is much collaboration between the site and its fans, who are targeted both for their laughter and ability to spread viral content.

Aside from these goals, two particular developments have fostered *The Onion*’s success in social media and politics. One has to do with the timing and nature of its content. After the September 11, 2001, attacks on the World Trade Center and Pentagon, most national comedy venues went relatively silent. *The Onion* was one of the first organizations to respond to the events with news headlines like “Hijackers Surprised to Find Selves in Hell.” This brazen and fast approach to creating comic news content has propelled the organization into the spotlight amid a 24/7 news cycle.

The other development has to do with the very form of *The Onion*’s productions—especially with its creation of the ONN, which copies the televised stylings of networks like CNN. In fact, it might be hard to differentiate the ONN from other traditional news organizations, were it not for slight tweaks in messaging, as in its video report “Poll: Bullshit Is Most Important Issue for 2008 Voters.” By parodying bloviating pundits, hyperbolic news graphics, and self-congratulatory titles for media segments like “In the Know,” ONN occupies a distinctive place in the political landscape.

While *The Onion*’s producers have exploited the Internet’s potential to go beyond television’s tendency to sanitize or censor much programming, recent trends may call into question how independent the organization will continue to be in developing content free from commercial media pressures. *The Onion*’s Web site is replete with advertising and ONN itself recently moved from the Internet to a show on the AMC Network’s channel IFC. Overall, however, *The Onion*’s discourses show no sign of diminishing in public culture, and if headlines like “Number of Users Who Actually Enjoy Facebook Down To 4” are any

indication, topics like social media will continue to undergo its trenchant, biting critiques.

Online Smear Campaigns

The 2008 presidential campaign was characterized by the online smear campaign that claimed that Barack Obama was Muslim. The main source of the smear against Obama was an e-mail chain that spread blogs, video-sharing platforms, and social

networks; subsequently, it was covered by the mass media, which finally prompted the Obama campaign to react. While this was, far and away, the most egregious and conspicuous of the season's smears, it was not the only one. There were probably hundreds of other smear campaigns, but only a few of them reached a greater audience. The main variable for breaking into the news was direct and indirect media coverage.

Nonetheless, some other examples need to be mentioned. John McCain had to deal with several smear campaigns: one that he was senile, one that he sold out his fellow POWs to save himself, and another about a supposed extramarital relationship with a lobbyist. Sarah Palin was the target of a smear campaign based on a series of spoof photographs circulated on the Internet. During the Republican primaries, Mitt Romney also suffered from the spread of statements about religion and personal beliefs that were falsely attributed to him.

Barack Obama

The story of the "Obama is Muslim" smear began on August 10, 2004, when Andy Martin, a former political opponent of Obama in Illinois and contributor to the Web site FreeRepublic.com, posted an article arguing that Obama had concealed his Muslim heritage. Martin wrote that "under Islamic law, Obama became a Muslim at birth due to his father's religion." Then, the first versions of the smear e-mail began to circulate on several Web sites and blogs, such as the U.S. Veteran Dispatch, Snopes.com, FreeRepublic.com, and About.com. *Insight*, an online conservative magazine owned by the Unification Church, published an article that claimed that Hillary Clinton's campaign was questioning Obama's religious background. The fact that Obama's main Democratic rival may have thrown the gauntlet down on the issue heightened the controversy. On January 19, Fox News Channel's morning show *Fox and Friends* broadcast a story based on the article published by *Insight*; on January 23 CNN.com published a report refuting the *Insight* story. The report asserted that the school attended by Obama in Indonesia was not a *madrassah* (muslim school), but it did not clarify many other aspects of the story. Instead of disproving the smear, the coverage of the story by a national cable news channel

and an influential news Web site only contributed to making the story more popular.

On February 10, 2007, Obama officially announced his candidacy for the Democratic presidential nomination. In the following days, the smear e-mail spread even further and faster. Around mid-November, the Obama campaign intervened for the first time by publishing a dossier on its official Web site titled: "Obama has never been a Muslim, and is a committed Christian." On December 5, the Clinton campaign acknowledged that one of its volunteers in Iowa had forwarded a version of the e-mail, and it disavowed him. On January 15, 2008, during the crucial period between the New Hampshire and Nevada primaries, Obama strongly reaffirmed his Christian faith in the Las Vegas primary debate. However, the slander was still leaving its marks on public opinion, as one in 10 Americans thought that he was Muslim.

On May 1, 2008, more than 600 videos referring to "Obama Muslim" could be found on YouTube, and some totaled hundreds of thousands of views. In the same period, there were 540 Facebook pages on the issue, equally divided between Obama's supporters and groups who backed the smear. On Myspace, the query "Obama Muslim" produced more than 1,000 results, most of them favorable to the smear. Finally, on May 12, the *New York Times* published a controversial editorial by Edward Luttwak that partially confirmed the speculations about Obama's Islamic faith and argued that,

. . . as the son of the Muslim father, Senator Obama was born a Muslim under Muslim law as it is universally understood. It makes no difference that, as Senator Obama has written, his father said he renounced his religion. Likewise, under Muslim law based on the Koran his mother's Christian background is irrelevant.

For the Democratic candidate it was now time to directly tackle the controversy. On June 12, Obama's campaign opened the Web site FightTheSmears.com, a platform through which Obama's supporters could defend their candidate from the smears that were hitting him. Obama's strategy was premised on the idea of replying to the slanders on the same medium where they originated.

One participant's response to the largely online campaign to declare President Barack Obama a Muslim at the satirical "Rally to Restore Sanity and/or Fear" led by comedians Jon Stewart and Stephen Colbert in Washington, D.C., on October 30, 2010.

Substantively, Obama had clear evidence on his side: he had been a Christian since his teenage years, and since the mid-1980s, he had been a member of a powerful Chicago-based Protestant church. However, some elements of ambiguity could have made it difficult to fight back on the topic, beyond the issues connected to the viral and anonymous origins of the smear. Obama's vulnerability came from spending part of his childhood in Indonesia (though Obama also grew up in Hawai'i), his Kenyan father and his Muslim stepfather; moreover, he emerged as a national political celebrity quite suddenly, which left voters little time to get to know his biography and background.

The calumny reached its peak in public opinion in the first months of 2008, when primaries were held in the first few states, and the candidates were not well known to the population. The

Pew Research Center found that in January 2007, only 5 percent of Americans thought that Obama was Muslim. The percentage increased gradually, peaking at 13 percent in March 2008, then rapidly decreased. At the same time, the number of people who did not know Obama's religion or refused to answer the question constantly dropped from more than 80 percent in January 2007, to about 25 percent near election day.

The seriousness of this smear needs to be evaluated in the context and political culture of the United States. On the one hand, the memory of the terroristic attacks by Islamic extremists on September 11, 2001, is still vivid and induces in many citizens the controversial equation between Islam and terrorism. On the other hand, historically, a candidate of any religious faith different from Christianity is perceived as uncommon and suspicious by part of the electorate. The religious slander was an attack on the patriotism of the candidate, and questioned his sharing of the values that keep the political community together and that the president, as a symbol of national unity, should embody. Furthermore, claiming that a politician practices a different religion than the one he publicly declares implies the even more dangerous insinuation that the candidate has deceived voters by hiding a central aspect of his personal life and identity.

John McCain

Republican candidate John McCain did not have to tackle one large smear attack, but instead had to face several minor slanderous accusations. One claimed that he was senile. Following concerns about his age (72 in 2008), about him having had previous multiple surgeries to remove melanomas and his notorious, rage-prone, impulsive nature, rumors about him losing memory started to spread when he began accumulating "gaffes." He muddled Al Qaeda with the Shiite branch of the Iraq insurgency, and he misread Korean dictator "Kim Sung Il" as "Kim Sung the second." He had odd explosions with questioners in town meetings during the campaign, referring to one young questioner as a "jerk," and saying to another "you're drafted," and singing his famous ditty "Bomb-bomb Iran." Bloggers noted these bizarre performances, and related videos appeared on YouTube, while others spread questions about McCain's

alleged dementia. Liberal activists were blamed, but these accusations did not have much impact on the race.

After winning the nomination, McCain's campaign had to deal with another dangerous smear campaign: The candidate was purported to have had a relationship with a telecommunications lobbyist, Vicki Iseman, nine years earlier. The Arizona senator was also attacked in a flyer prepared by a group called Vietnam Veterans Against John McCain. The group set up a Web site that detailed the allegations presented on the flyer that McCain was exploiting his POW status and that he collaborated with his captors to save himself and not his colleagues. McCain, however, was able to intercept the attacks before there was major damage.

Sarah Palin

Sarah Palin's credibility as a candidate for U.S. vice president was also undermined by a series of spoof photographs circulated on the Internet. The sexy pictures, which exploit her glamorous image, were published amid a concerted campaign against the former beauty queen, following her surprise appointment as 72-year-old Republican candidate John McCain's running mate. One showed her wearing a leather miniskirt and stilettos, while another had her in a stars and stripes bikini, brandishing a rifle. Palin looked like a stripper, and while the images could be seen as harmless fun, they hindered the relatively inexperienced 44-year-old Alaskan Governor's attempts to be taken seriously as a political candidate. The Republican campaign blamed a vague "liberal lobby" for the images, but no clearly responsible party was found.

Mitt Romney

During the 2008 Republican primaries, a bogus Christmas card "from the Romney family," containing controversial quotes from the Book of Mormon, found its way into the mailboxes of South Carolina Republicans. The holiday greetings appeared positive, with the greeting reading, "We wish you and your family a happy holiday season and a joyful New Year," but the foul play from the covert authors was far from merry. The card included Book of Mormon passages designed to make conservative Christian voters in the state feel uncomfortable with the Mormon candidate.

One quote said that God had multiple wives, while another stressed that the Virgin Mary was "exceedingly fair and white." Neither the Romney family nor the Boston, Massachusetts, temple cited on the card had anything to do with the mailing. Fortunately for Romney, the attack was limited, and his race did not suffer much from the slander.

Conclusion

The launch of smear campaigns is easier than ever because of the Internet; extensive advertising budgets are not necessary. The Web is an ideal vehicle for slander for two main reasons: first, attacks can remain anonymous, allowing promoters to escape responsibility for launching them; second, they can be diffused toward selected groups of voters and opinion leaders in a way that opponents cannot immediately discover, which allows the slander more time to spread and gain momentum before targets have the chance to answer. However, the calumny damages the candidate's image as long as it remains under the surface, circulating on the Web and gaining only sparse attention by the mainstream media. As soon as it attracts attention on a larger media stage, a candidate's campaign can promptly react on the same media from which it came, and the untruth of the story may rapidly emerge in both the media and public opinion.

Open Data

Open data is nonprivacy-restricted and nonconfidential data that is produced with public funds and is made available without restrictions on its usage or distribution. Private, confidential, and classified data is excluded because this data is inappropriate to publicize. Public data, available to citizens, should meet certain requirements contained in the open data principles. These principles propose that data must be complete, primary, timely accessible, machine-processable, nondiscriminatory, nonproprietary and license free.

Open government data are all stored data of the public sector that could be made accessible by the government in a public interest, without any restrictions for usage and distribution. Some exemplary realizations, such as apps, mash ups, and services based on open government data can be found in the Web-based portal data.gov of the U.S. government, data.gov.uk of the British government, and the DataSF App Showcase of the City of San Francisco. Linked Open Data are all stored data connected via the World Wide Web that could be made accessible in a public interest, without any restrictions for usage and distribution.

The content of open data can be statistics, geo-data, traffic data, education material, scientific publications, medical studies, and even radio and television programs. The term *open data* not only combines stored data of the public sector, but also includes data from businesses or nonprofit organizations. Transparency, participation, and collaboration are the main issues of the integration of citizens in the paradigm of “open government,” which acts as an umbrella term for different ideas and concepts. This evolution toward an open state, including open politics and open administration, can be seen as the path toward a government 2.0. North American cities like New York, Chicago, Portland, San Francisco, and Vancouver have begun to release their datasets. The U.S. government has also done so, as have the

governments of Australia, Estonia, New Zealand, Norway, and the United Kingdom (UK), along with global organizations like the United Nations and the World Bank. Some countries and cities are fully embracing the idea of opening up their data to the public, while others are still more reluctant to see the opportunities that the availability of public sector data will bring to the public.

Tim Berners-Lee, one of the main proponents of open data in the UK, argues that government data is put online to increase accountability, contribute valuable information about the world, and enable government, the country, and the world to more efficiently function. One example of open data from the UK is the expanded availability of crime-related data, coupled with mapping software, which encourages citizens to investigate the security of their neighborhood. They are then able to draw conclusions about the performance of their local police service. The open data movement’s main objectives are to make public sector information available to the public to increase transparency and participation, as well as to achieve greater administrative efficiency and create economic value from public data.

A number of barriers exist to prevent the spread of open data. Such barriers exist at the institutional level, the task complexity of handling the data, the use of open data and participation in the open data process, legislation, information quality, and at the technical level. Since the start of the open data movement, many federal agencies have adopted a rather passive stance to open data programs by indexing a minimal quantity of data while locking more valuable datasets inside closed databases. There are significant differences in national rules and practices regarding the execution of open data policies. Other critics say that open data empowers the already empowered, such as the tech-savvy people who do not need to be convinced that open data can improve government. Various public administrations have established codes of conduct, specifying the uses that can be made of public sector information. The UK code of conduct, published on data.gov.uk, illustrates the conditions that should guarantee the quality of public sector information when it is disseminated by citizens.

Open Society Foundations

The Open Society Foundations (OSFs, formerly the Open Society Institute) are a family of donor foundations and offices founded by Hungarian American business magnate, investor, and philanthropist George Soros that support civil society groups around the world. Aimed to build vibrant and tolerant democracies with governments that are accountable to their citizens, the OSFs implement local initiatives that advance justice, education, public health, and independent media. As a global network, Open Society Foundations aspire to build alliances across borders and continents on issues such as corruption and freedom of information. The foundations place a high priority on protecting the rights and improving the lives of people in marginalized communities, shaping public policies that ensure greater fairness in political, legal, and economic systems, and safeguarding fundamental rights. OSFs projects include the National Security and Human Rights Campaign that opposes detention of unprivileged combatants, and the Lindesmith Center and others dealing with drug reform. The Open Society Foundations also award grants, scholarships, and fellowships.

The name of the foundations was inspired by Austro-British philosopher and professor at the

London School of Economics Karl Popper’s book *The Open Society and Its Enemies* (1945). In his view, the open society is a place that permits its citizens the right to criticize and changes institutions as they see fit; he rejected the imposed intellectual conformity, central planning, and historical determinism of Marxist doctrine. According to Popper, any belief system or individual claiming to be an “ultimate truth” is an “enemy” of the open society.

In 1984, George Soros established the Open Society Foundations to help countries make the transition from communism. From that time, the activities of the foundations have grown to encompass the United States and more than 70 countries in western and eastern Europe, Asia, Africa, and Latin America. Each foundation relies on the expertise of boards composed of eminent citizens who determine agendas based on local priorities.

Open Society Foundations include the following offices and regional foundations located throughout the world: the Open Society Initiative for Eastern Africa, Open Society Foundation for South Africa, Open Society Initiative for Southern Africa, Open Society Initiative for West Africa, Open Society Afghanistan, Tifa Foundation Indonesia, Soros Foundation–Kazakhstan, Soros Foundation–Kyrgyzstan, Open Society Forum–Mongolia, Foundation Open Society Institute–Pakistan, Open Society Institute Assistance Foundation–Tajikistan, Open Society Foundation for Albania, Open Society Foundations–Armenia, Open Society Institute Assistance Foundation–Azerbaijan, Open Society European Policy Institute, Open Society Fund–Bosnia and Herzegovina, Open Society Institute–Sofia, Open Society Fund–Prague, Open Estonia Foundation, Open Society Georgia Foundation, Open Society Foundations–Budapest, Kosovo Foundation for Open Society, Soros Foundation–Latvia, Foundation Open Society Institute–Macedonia, Soros Foundation–Moldova, Foundation Open Society Institute–Representative Office Montenegro, Stefan Batory Foundation (Poland), Soros Foundation Romania, Open Society Foundation Serbia, Open Society Foundation–Bratislava (Slovakia), Open Society Initiative for Europe (Spain), Open Society Foundation–Turkey, International Renaissance Foundation, Open Society Foundation–London, Foundation Connaissance et Liberte

(Haiti), Arab Regional Office, Open Society Institute–Baltimore, Open Society Foundations–New York, Open Society Foundations–Washington, D.C., and the Open Society Policy Center.

Since civil society initiatives and civic activism have entered online and have started to apply Internet instruments in many countries, they have made new paths to democratization and access to information. OSFs support of social media as a tool to promote change, engage people, and make a significant political and social impact has increased during recent years.

Application of Internet and social media as a space for open communication and uncensored ideas exchange has become an important part of the OSF's work in many countries, especially in countries where democracy suffers from media censorship and control. Besides the funded projects that promote e-governance, OSFs launch new interactive online platforms focused on human rights, transparency, public health, and education, supporting online civic activism. OSFs' grantees utilize Facebook, Twitter, and YouTube to share content and initiate public discussions. The Open Society podcast features audio recordings of panel discussions, talks, and book launches. The podcast is delivered through RSS feed syndication and can be played on a computer or automatically downloaded to an iPod or other MP3 player.

Recent projects supported by OSFs have been focused on research about social media's impact on democratic change in different countries. For example, a survey of 1,865 Facebook users, funded by OSFs, explains how Beppe Grillo, Italian blogger and politician, "has used social media to communicate, recruit and organize, growing the Movement 5 Stelle from practically nothing to a major political force in Italy in the space of three years, with it expected to play a crucial role in the 2013 Italian elections." His antiestablishment message has resonated with many against a backdrop of declining trust in political institutions, falling political party membership, and ever-lower voter turnout.

In 2011, the OSFs supported a survey of over 13,000 Facebook supporters of populist parties in 12 European countries, conducted to understand who these "digital populists" are, what they think, and how their online behavior maps onto what

they do in the real world, to examine how social media is changing politics and political activism in Europe, and what this means for mainstream and fringe parties. Another example is a study commissioned by the Open Society Foundations that looks at how new technology serves for economic development and more efficient governance in Turkmenistan. OSFs global research project Mapping Digital Media examines media digitalization in 60 countries around the world and looks the changes connected with media digitalization and how it affects news about political, economic, and social affairs.

Open Source Governance

Open source governance is a term used to describe the application of open source principles and practices to governing institutions. Typically invoked in the context of computer software development, "open source" refers to a transparent and distributed production process, wherein both the final product and the process leading to its development are "open" to multiple contributors and users. In some cases, open source organization leads to peer production: a largely self-organizing group of individuals who negotiate, peer review, and collaborate to produce something that any one participant would not easily be able to create alone. The Internet, and in particular, social

media, with their capacity to host low-cost, networked communication, have supported the rise of open source projects, with the most famous example being Wikipedia.

Proponents of open source governance argue that governing institutions are more democratic, transparent, effective, and efficient when they enable members of the public to contribute to their work. While political parties, legislatures, and governments have begun to adopt open source principles and practices, a number of barriers complicate their efforts.

Drivers of Open Source Governance

Advocates of open source governance typically advance the following three arguments in its favor:

- *Democratic engagement:* Open source governance introduces new and potentially more powerful avenues for citizens to influence their governing institutions. As a result, advocates argue that such initiatives may inspire greater rates of political participation. Additionally, open source governance is thought to strengthen the representative functions of governing institutions, since it can enable these institutions to better understand and reflect the values and interests of the public.
- *Transparency and accountability:* Advocates argue that by making the decision-making processes of governing institutions open to mass collaboration, institutions must share information that might previously have been kept from the public domain (both with regards to the institution's internal processes and to policy issues). As a corollary to this, some argue that heightened transparency will bolster accountability as citizens become "armchair auditors," scrutinizing governing institutions with data released for public use.
- *Effectiveness and efficiency:* Since open source governance enables governing institutions to draw on the insight of a broader base of individuals, advocates argue that it will lead to more effective

policies, programs, and services that are developed at a lower cost.

Barriers to Open Source Governance

Governing institutions face a number of challenges when adopting the principles of open source governance. First, these institutions must address the question of how representative the sample of participants is for any given initiative. Research suggests that those who engage in online political participation are not reflective of the general population. Similarly, in online collaborative environments, a small number of users tend to make the bulk of the contributions. If an institution aims to use open source governance to raise levels of political participation, it may not be an appropriate route.

In addition, open source governance raises a series of legal concerns. First, when soliciting information from citizens, governing institutions must ensure that adequate procedures are in place to protect participants' privacy. Second, governing institutions must develop policies on the ownership of goods developed via collaborative processes or that make use of data owned by governing institutions. Third, institutions must consider who is accountable for the outcomes of collaborative processes, in particular, when those outcomes are undesirable. Finally, governing institutions may need to revise policies on citizen engagement, because in some cases, legal restrictions addressing when and how an institution can engage with the public are incongruous with the dictates of open source governance.

Finally, governing institutions steeped in a tradition of hierarchical decision making and unaccustomed to open information sharing may struggle to adapt to the principles of open source governance. Similarly, outdated information technology, weak information management practices, and a lack of technical expertise may hinder institutions hoping to employ new technologies like social media to engage with the public.

Open Source Politics

The idea that citizens can be empowered to play a more active role in public policy through the use of Web-based collaborative tools is the basis of a new policy model. This new concept—open source politics—sees the political process as a wide and comprehensive wiki, continuously fueled with new or revised contents produced by an engaged citizenry. It aims to enable common citizens to actively participate in the creation of public policy content through online e-participation technologies, and to influence policy decisions on issues of public interest. By engaging citizens in the policy process, open source politics performs more efficiently, more effectively, and produces more just and equitable policy outcomes than those that would result from the narrower perspectives that characterize policy makers and other core stakeholders in conventional politics. In other words, open source politics is seen as an efficient form of bringing into the policy decision-making process different perspectives and a continuous flow of updated knowledge.

The term and concept of *open source politics* has been applied by authors from different academic backgrounds with slightly different meanings. Nonetheless, they all use it to refer to a perspective that aims to apply in the policy process the principles of the open source movement, developed in the software community. Like open source software, which is designed to allow users to alter its code to make improvements, open source politics allows citizens to change or

reprogram policies in order to improve them. In open source politics, citizens are regarded as partners instead of customers, in all stages of the policy process and in public service delivery. Citizens can rewrite the "codes" of formal policy proposals by using new digital and online technologies. Open source politics opens the policy process to all sorts of participants, letting them evaluate plans and projects proposed by policymakers, make recommendations, launch new proposals, and influence the shift of resources from one option to another. Open source politics means, to a certain extent, the replacement of current forms of governing by new governance models that allow and enhance direct citizen inputs in the policy process, including citizen coproduction of policy contents. The advent of new digital tools and online collaborative platforms made the implementation of this model of open source politics easier in all political and administrative layers.

Other terms such as collaborative governance, politics 2.0, Web-enabled government, or open source governance, to name just a few, have also been introduced to mainstream political discourse to designate a similar or the same perspective of the policy process. In other fields, similar approaches regarding citizen engagement have also emerged. In the media sector, for example, the term *citizen journalism* is now frequently applied, and the same happens with the term *citizen science* in an increasing number of scientific disciplines. These are just two examples of the deep changes that have been introduced in the way that professionals develop their activities, in particular in the role given to individuals as user-generators of all sorts of content and perspectives. Crowdsourcing is another example of similar changes that are occurring in other fields, from private business to public policy, in this case in all tiers of the political and administrative structure.

Despite the increasing acceptance and widespread use of this concept, some objections have been raised regarding the term *open source*, in particular due to the fact that the technologies used are not open source, as is the often cited case of YouTube and similar Web 2.0 platforms. On the contrary, from another perspective, it can be argued that the term *open source* emphasizes the fact that it is the new information and communication technologies that are making politics and

A participant at an event for reThinkCali reads from the organization's online materials on a mobile device. reThinkCali.com, an online effort to "fix California" with residents' help, claims the "world's first virtual constitutional convention."

the public policy process more participatory and transparent. There are different software applications available that can be used to engage citizens in a process of open source politics. Among the chief instruments of open source politics are the Web 2.0 tools (e.g., open forums, blogs, and wiki platforms), which can be used to compile ideas and proposals from citizens and other stakeholders around specific issues, in the initial stage of the policy process (e.g., the preparation of a policy program or urban plan), or during the implementation, monitoring, or evaluation stages of the policy process.

Advantages and Weaknesses

Open source politics is seen as an open political process that has numerous advantages over conventional forms of citizen engagement in the public policy process. The use of new information and communication technologies, in particular

Web 2.0 tools, enhances the ability of common citizens to influence the political, legislative, and administrative processes, at both national and subnational tiers. These tools and platforms can be used to deliver information to specific sections of the population but also to proactively connect citizens and policymakers in all stages of the decision-making process.

Open source politics contributes to the renewal and innovation of policy content, increasing the diversity of perspectives and experiences of participants. It allows input from citizens of other political perspectives, collecting knowledge and intelligence that can rival that of the much narrower and more specialized perspective of the conventional political actor, and may benefit society as a whole.

However, open source politics also faces a number of difficulties and weaknesses. As in other models of participative governance, there is also in this case the risk of control of the policy process by a group of more active citizens. Some political leaders and policymakers tend to see open source politics as a threat to their leadership role within the community, and may boycott its full implementation. Issues of trust, transparency, privacy, and confidentiality are also present in open source politics and require due consideration by those involved in the design of these participatory processes.

OpenCongress.org

Founded in 2007 as a nonprofit organization, OpenCongress is an Internet resource Web site that is open source, nonpartisan, and free to the public. Created in order to facilitate public tracking of congressional bills, OpenCongress provides more detailed and in-depth information to the public than found in typical news media articles. By integrating articles from the news media with key information surrounding legislation (e.g., sponsors, summaries, status, roll calls, and public reaction), OpenCongress seeks to empower individuals through enhanced context and perspective. In so doing, it has developed into an organization involving over 150,000 members and receiving about 1 million visits each month,

making it the most popular government transparency Web site in the United States.

OpenCongress was launched by the Participatory Politics Foundation (PPF) and the Sunlight Foundation, both 501(c)3 nonprofit organizations. While the PPF runs OpenCongress, the Sunlight Foundation serves as its founding and main sponsor. Intended to assist the public in unveiling the behind-the-scenes functioning of the legislative branch and its officials, OpenCongress seeks to help individuals see the political realities (often unreported or underreported by the news media) of activities on the part of their representatives and Congress as a whole.

By combining government information with social media, networking, and avenues for participation, OpenCongress attempts to place Congress in greater context in order to bring about greater accountability by the public. In this vein, OpenCongress provides detailed information regarding particular legislation, along with official congressional reports and analyses by news media and the blogosphere, to provide a comprehensive portrait (big picture) of Congress along with its workings, members, and various pieces of legislation. Thus, individuals unaware of who their representatives are can locate them by zip code, and from there can view their senators’/representatives’ voting history, campaign contributors and contribution amounts, recently sponsored bills, and stances on various policy issues.

A key resource for users is the OpenCongress wiki, a collaboratively written “citizens’” encyclopedia on Congress. The OpenCongress wiki began as Congresspedia in 2006, with the mission of shedding more light on the political realities and dynamics of Congress and its inner workings. In 2009, Congresspedia merged with OpenCongress to form the OpenCongress wiki. Continuing the mission of Congresspedia, the wiki seeks to arm individuals and the news media with the necessary information to hold Congress and its members more accountable, and to bring about greater transparency in the system and expose corruption. The OpenCongress wiki allows users to more closely scrutinize members of Congress and to develop informed opinions on congressional activities and the political system in which they take place. Because this resource is a wiki, anyone may add new, or alter current, information. However,

the OpenCongress wiki is monitored by an official editor and staff in order to verify the accuracy of information.

Another major resource offered by OpenCongress, “The Money Trail,” focuses on wasteful spending, and targets corrupt practices on the part of politicians. In seeking to hold elected officials accountable, OpenCongress utilizes this instrument to show the inner workings of Congress as well as the potential implications and practical consequences of various bills. OpenCongress places great emphasis on delineating key, underlying aspects of bills such as their supporters, their funding sources, and their proposals, in order to get at the “essence” of bills. The objective is to inform and educate the public in order to empower their political ideas and actions.

On the OpenCongress Web site, individuals can also locate bills that they are interested in by browsing through issue areas. OpenCongress organizes every piece of legislation by issue areas defined by the Congressional Research Service, the nonpartisan research arm of Congress. With over 4,000 issues, users can scrutinize congressional activity in any one of these areas. Users can also examine swing votes by members of Congress and find primary supporters of legislation, allowing more targeted grassroots lobbying campaigns.

In addition to allowing individuals to analyze and follow bills, congressional officials, and policy issues, users can also track events through My OpenCongress, a social network that relies on peer-to-peer communication to share pertinent information on areas of particular interest. Social networking, along with social sharing tools, permits an open exchange of information among individuals. By creating a profile, users can follow, remark, and even vote on items they are concerned about in Congress. In this fashion, users’ profiles serve to tailor information to their individual needs and interests concerning bills, the legislative process, members of Congress, policy issues, and more. Along with profiles of individuals utilizing resources on the OpenCongress Web site, the collective social network helps foster personal engagement in the democratic process.

Open.Dems

Open.Dems (open.democrats.org) is an open source initiative by the Democratic National Committee (DNC), launched in 2010. The Web site serves as a clearinghouse for open source technologies, including APIs and other software, developed by the DNC. Much of what is released through Open.Dems was developed by the DNC’s new media shop and innovation labs, under the purview of the DNC’s new media director, Natalie Foster, hired in 2009.

Foster was hired after the success of the 2008 Obama campaign in an attempt to maintain that momentum and continue to develop social media outreach and new media initiatives for the Democratic Party. Foster arrived at the job under considerable scrutiny because it was widely known that the Obama for America campaign had an enormous campaign database, and that after its 2008 successes, whoever took over the reins of new media and social media would do so under a heavy burden of expectations. Open.Dems was one of her most noteworthy initiatives.

The significance of Open.Dems goes beyond the availability of open source software. It is intended as a signal that Democrats have adopted the open source ethos and have applied it to politics, blurring the line between professional and grassroots, lowering the fence in order to better collaborate

and better share information and tools. At launch, Open.Dems consisted of three main projects: an open source API clearinghouse; a selection of computer code by DNC developers; and a blog on new media issues relevant to the Democratic Party, fundraising, crowdsourcing, and related matters. One piece of code hailed at the time of release was the Lock Box, a Rails-based code that improved the way that multiple APIs could be combined. (An API is an application programming interface, a protocol app developers use in the creation of Web apps.)

The Open.Dems project released a voter registration API, which allowed developers to create streamlined voter registration apps consistent with local state laws. Developers using the API needed to sign up as a partner with Raise Your Vote, the DNC's 2010-launched voter registration drive. Voter registration apps allow users to either register to vote from the Web site, or access the information they need to register by mail or in person, depending on the registration laws in their state. Like Raise Your Vote, the voter registration API was motivated by the observation that Democratic success in elections largely rose and fell with voter participation. In particular, the 15 million new voters in the historic 2008 presidential election were overwhelmingly Democratic voters, many of them coming from traditional Democratic bases like young people, blacks, and Latinos.

Open.Dems' Polling Place API allowed developers to incorporate dynamic polling place lookup in their applications, to make it easy for users to find their nearest polling place. Open.Dems also released a mobile app, on both iOS (iPhone, iPad) and Android platforms, for Organizing for America, the grassroots registration program that succeeded the Obama for America campaign organization.

The canvassing iOS and Android app released by Open.Dems was praised by many users, providing information about Obama supporters in the canvassed region, as well as bringing up a list of local organizing events and allowing canvassers to take notes on their conversations with voters, which are uploaded to campaign headquarters. Released in 2010, it was considered the most important and effective campaign tool released that campaign season.

Blog entries on Open.Dems have addressed issues like OFA's discoveries of the best strategies for asking supporters to donate money, and in particular the fact that advocacy e-mails with a "donate" button increased the number of unsubscribing recipients, decreased the number of responses, and failed to increase the number of donations. Other issues covered included the use of splash pages in Web sites and the use of Ruby on Rails in the Raise Your Vote's Web site's back-end. Open.Dems also runs an associated Twitter account, @opendems.

OpenGovernment.org

OpenGovernment.org is an open source, public Web site that was launched in January 2011. Designed to allow users freer access to information on state and local government, the site seeks to arm citizens with the necessary knowledge to hold government and governing officials accountable. Created by the Participatory Politics Foundation (PPF) and the Sunlight Foundation, two 501(c)3 nonprofit organizations, OpenGovernment is a nonpartisan, public resource. By displaying aggregated information on government, together with

information such as campaign contribution data and online social commentary, OpenGovernment seeks to provide the most user-friendly experience available when viewing state- and local-level political information. In addition, OpenGovernment provides avenues for public participation through various instruments in seeking to advance greater civic engagement and transparency at state and local levels of government.

The central goal of OpenGovernment is to provide a comprehensive, easily accessible site for locating political information on state/local government. In order to shed more light on state government, PPF and the Sunlight Foundation founded OpenGovernment as a joint venture along with the community-initiative Open States Project. With information on six state legislatures (California, Louisiana, Maryland, Minnesota, Texas, and Wisconsin), OpenGovernment plans to extend its reach to include the remaining state governments—along with a handful of big city governments—in the near future.

Derived from the same group that created OpenCongress.org, a Web site devoted to greater transparency on U.S. congressional members and activities, OpenGovernment was modeled after this project. In attempting to hold state/local governments more accountable, OpenGovernment was intended to serve an analogous role to OpenCongress—that is, fostering greater transparency in government—at subnational levels of government. To carry out this task, OpenGovernment brings together state/local legislative information with news articles, voter/voting databases, blog postings, public online forums, social media commentary, wiki platforms, and other resources to allow citizens to see the true happenings in government. By combining government data and information on state officials with databases, press coverage, and social media, OpenGovernment seeks to facilitate the process of citizens acquiring information relating to important bills, activities of legislators, campaign contributions, and more.

Official state government Web sites, such as those with “.gov” URL addresses, serve as the main foundation for government information on OpenGovernment’s site. The Open States Project first processes this data (e.g., bills, roll calls, legislative actions) into a standardized format

before sending it to OpenGovernment. Once acquired, OpenGovernment then contextualizes this data with information from sources such as press accounts, the blogosphere, discussion forums, and social media. By complementing this with a range of public engagement instruments, OpenGovernment provides citizens with a user-friendly Web page for acquiring information on a variety of governmental actors, issues, and processes at the state level. Equipped with such knowledge as committee assignments, full texts for bills, interest group ratings, and vote analyses, users can see what really goes on in their state legislatures.

Visitors to OpenGovernment can track bills via RSS feeds, comment on bills, convey information to others via social sharing tools, and contribute to public knowledge of bills via peer-to-peer communication. In addition, OpenGovernment allows users to find, track, and contact their representatives via e-mail straight from OpenGovernment’s Web page. With such built-in mechanisms, citizens can organize grassroots call-ins to officials on important votes, and coordinate mass e-mailing to make officials aware their constituents are watching. By providing engagement tools such as the ability to sort bills by “most-viewed,” “date,” and “most-in-the-news,” users can readily acquire crucial information that was previously inaccessible. OpenGovernment’s offerings also lend themselves to journalists in their reporting of political news as well as to citizen activists and watchdog groups.

Conclusion

OpenGovernment seeks to ensure compliance by all three branches of government (executive, legislative, and judicial) at all levels of government (local, state, national) with the principles of open government data. These principles include notions such as the following: government information should be readily available to the public, should be made public completely and without delay, and should be accessible to all online in order to foster public trust in the political system. However, OpenGovernment faces the political realities of state governments not living up to these principles and best practices. Public access to even basic government data on bills and voting can be severely limited. Though OpenGovernment

seeks to make such vital information easily accessible to the public, even displaying state legislative actions such as roll calls in real time to the public is still not possible.

OpenLeaks

OpenLeaks is a whistleblowing online project founded in September 2010, by former WikiLeaks spokesperson Daniel Domscheit-Berg with former employees of WikiLeaks. OpenLeaks aims to provide technological tools and know how to every organization or media outlet interested in giving whistleblowers a channel to anonymously submit material and documents on the Internet. OpenLeaks presents itself as a technical framework and knowledge base aimed to enable whistleblowers to disseminate data to third parties.

However, unlike similar Web sites, OpenLeaks' vision of whistleblowing involves working in cooperation with partners such as nongovernmental organizations, media outlets, unions, and human rights organizations in order to share the process of digital leaking. Different from

WikiLeaks, which set the standard for online whistleblowing, OpenLeaks does not receive or publish documents on its Web site, but its partners can receive leaked content on their Internet domains via a digital dropbox within the OpenLeaks network. OpenLeaks is one of the major digital whistleblowing projects, which was popularized after the rise of WikiLeaks.

OpenLeaks has often been defined as a WikiLeaks spinoff because of Domscheit-Berg's affiliation with WikiLeaks and some similarities in terms of technology and purpose. The entire OpenLeaks project started as a detachment from Julian Assange's platform. One of the major parallels is the opportunity for whistleblowers to submit sensitive documents in a safe and anonymous way using an online dropbox. However, OpenLeaks focuses more on a collaborative orientation with interested parties. Unlike WikiLeaks, OpenLeaks was not created as a platform to publish documents, but instead to make leaked information available to interested and trusted recipients. OpenLeaks argues that the whistleblowing process has to be rethought: WikiLeaks centralizes all steps in the whistleblowing process, from receiving to publishing leaked information, whereas OpenLeaks wants to abandon this concept by separating submitted documents from their publication. In contrast to WikiLeaks, which tends to publish documents without involving external partners, OpenLeaks aims to give leaked content to the best receivers for editing, fact checking, and publication, acting as a neutral conduit between anonymous sources and recipients.

When submitting documents to OpenLeaks, sources must decide where and how their data will be leaked. Sources can name an organization within the OpenLeaks network to address their leaks, or give the information to the whole community. OpenLeaks' perspective is to increase "direct leaking for socially localized, and not just global, issues," providing a transparent whistleblowing process by involving trustful organizations when it comes to editing and publishing leaked information. In OpenLeaks' vision, cooperation with partners will ensure more transparency and accountability to the platform, together with more protection for people mentioned in the leaked documents. In addition, OpenLeaks' commitment to source privacy and safety confirms

Daniel Domscheit-Berg, now of OpenLeaks, speaking about WikiLeaks at the hacker convention Chaos Communication Congress in December 2009 in Berlin, Germany.

the platform's role as a neutral conduit. Still, as OpenLeaks appears to still be in a preparatory phase, only its declaration of intent can be analyzed. However, OpenLeaks' activities go further than technology and coding—recently, the project has also been working in the field of knowledge sharing, organizing workshops on encryption and digital whistleblowing to encourage other organizations to build similar platforms with proper skills and competence.

OpenLeaks' domain was registered in September 2010, and was launched in December of that year. In January 2011, OpenLeaks was supposed to launch its operations together with the German dailies *Die Tageszeitung* and *Freitag*, Denmark's *Dagbladet Information*, Portugal's *Expresso*, and the Berlin-based Foodwatch nonprofit group. Yet, the operation never started. In August 2011, OpenLeaks staff attended the Chaos Communication Camp (CCC) in the suburbs of Berlin to test

its platform with a security penetration test, asking CCC hackers to stress the OpenLeaks infrastructure as much as possible in order to check its safety and reliability. The launch failed again. In April 2012, during the Share 2 Conference in Belgrade, Daniel Domscheit-Berg announced that OpenLeaks had set up offices and workshops to train activists and journalists on how to safely handle digital whistleblowing. The creation of the OpenLeaks structure was instead announced as “on the way,” but no leaks appeared. In December 2012, a blog post on the OpenLeaks Web site announced that the project was still alive. At this stage, OpenLeaks was presenting itself as more focused on the transfer of know how for organizations willing to provide a whistleblowing service, while the provision of such a service seemed to be secondary. However, in April 2013, the Web page for OpenLeaks was offline.

The OpenLeaks project has been highly debated in the hacker community and in the media. Daniel Domscheit-Berg left WikiLeaks in 2011 because of intense discord with Julian Assange. Later that same year, he published his memoirs, *Inside WikiLeaks*, revealing details about the organization and mentioning a cache of data that Domscheit-Berg and another ex-WikiLeaks staffer, known as “The Architect,” took with them when leaving WikiLeaks. Among the data taken was the submissions system, together with the archive of published documents, and thousands of unpublished documents. The further deletion of WikiLeaks' unpublished documents by Domscheit-Berg and The Architect signaled the height of the internal dispute between WikiLeaks and OpenLeakers. As a consequence of this struggle, Daniel Domscheit-Berg was expelled from the hacker association Chaos Computer Club in 2011, but he was readmitted in 2012.

OpenTunisia.org

OpenTunisia.org is a Web site created at the beginning of the Arab Spring. It reflects a host of online activities undertaken by the Arab diaspora in support of their compatriots' goals of political reform and open and accountable government. This particular site is the brainchild of Internet activist Chemseddin Ben Jemaa, a Tunisian expatriate who registered the domain name toward the beginning of the Arab Spring, in February 2011. According to the site, it is part of a much larger project to promote open governance, access to information, and government transparency and accountability in Tunisia. This effort includes external sites with specialist aims like OpenGov.TN, which hosts discussions and creates white papers on proposed reforms to make the Tunisian government more accessible to citizens.

Open governance and responsiveness and access to the citizenry are difficult goals to achieve for even the most well-established liberal regimes. In the case of Tunisia, there is a long history of government by dictators who allowed wide discretion in personal life, but required loyalty to one-party rule in public life. In order to establish a clean break with its past, activists like Chemseddin Jemaa believe that average Tunisians must have instant access to not just information, but also to tools that help them interpret, interact with, and distribute that information. This is why registered users of the site gain access to an interface with a variety of cloud computing applications. These include common functions like word processing and database management, as well as

games and forum creation tools. For people who do not have the funds to purchase expensive software, this removes an important barrier to access of full digital citizenship. More specialized tools, including voting record wikis, contact information lists, and online government reform discussion groups are also easily accessible via the page.

Some of the more influential tools available on OpenTunisia include Mumble, a voice over Internet protocol (VoIP) service that makes telephony affordable to the masses; Dev.TN, a lab in which application developers can access tools to help them innovate new means of creating links between Tunisians and their government; Images.TN and Pad.TN, image hosting and collaboration wiki sites that allow Tunisians to publish photos to a secure cloud service and to work on joint projects or have group discussions in real time; and RoundCube, a free Web mail service. Each of these efforts is a reaction against Tunisia's history of censorship and political repression.

During times of political unrest, it is common for regimes to cut off access to mobile phone networks and social media. However, tools like Mumble allow people to gain phone access as long as they can find a Wi-Fi hotspot for their smartphone, or have alternative Internet access. Although this could also be restricted by a determined government, the potential fallout and signals of threat perception make attempts to shut down local Internet a last resort for most regimes. Likewise, it is essential for regimes to provide work opportunities for their populations, and technological innovation is often an important part of achieving this end. The Dev.Tn platform is a valuable asset because it allows budding application developers to innovate, to access tools they couldn't otherwise afford for making better products, and to gain skills that could make them more employable, while furthering OpenTunisia's goal of improving access to the government.

Image hosting is already available on sites like Flickr and Tumblr, but Images.TN is not a typical image-sharing facility, but rather a hacker space, as its Web banner demonstrates. Its image library and Twitter feed allow users to interact with one another in an online community and to post images relevant to the pro-open information goals of the group. Coupled with the collaborative opportunities from HackerPad (Pad.Tn), this

type of community represents not just a reaction against the former regime, but also an affirmation that the group intends to ensure that the new regime is true to its promises of political freedom and transparency. Finally, RoundCube provides one of the most basic tools for those seeking an online presence, an e-mail address. This effort may seem redundant because the ubiquity of enormous cloud Web mail services, but it is a means of placing a Tunisian identity on a tool that ultimately becomes highly linked to most users' personal lives and identities.

OpenTunisia.org is part of a broad trend in online political activism to require states and regimes to be more transparent, more accessible to constituents, and more accountable when representing their aims and goals. Its suite of basic computing software and community-building and political activism tools are one way in which activists like Chemseddin Ben Jemaa can make technology more democratic, and can potentially make their democracies more stable and responsive.

of communication elaborated by Paul Lazarsfeld and Elihu Katz. Despite the enduring popularity of the concept of opinion leadership, academic researchers have only recently begun to explore the ramifications of online opinion leadership. Online opinion leaders differ from their offline equivalents. The major distinction in the online environment is that opinion leaders and nonleaders are much more similar than they are in the offline world.

In 1940, a group of researchers guided by Paul Lazarsfeld investigated how much influence the mass media exerted during presidential elections. They focused their attention on the media's role in the election between Democratic incumbent Franklin Delano Roosevelt and Republican challenger Wendell Willkie. To gather data, they set up an extensive infield study in Erie County, Ohio. The study's results indicated that neither radio nor print had as much influence on voters as had been suspected. The researchers found that most of the people studied relied more on other people for the information they used to make voting decisions. Lazarsfeld then began to study the individuals who were relied on for information, calling them "opinion leaders." He found that an opinion leader could be just about anyone. However, further analysis revealed that opinion leaders were better informed than the average person, and in general, they tended to read more newspapers and magazines and listen to more radio news and commentary.

Furthermore, Lazarsfeld and Katz advanced the idea that one or more of these factors make noteworthy opinion leaders: expression of values, professional competence, and nature of their social network. Opinion leaders seek the acceptance of others and are especially motivated to enhance their social status. They can influence members in the social community because of special techniques, knowledge, personalities, and other unique qualities, and are commonly described as people with high social participation, status, and responsibility. Opinion leaders are seen as trustworthy and nonpurposive. People do not feel that they are being tricked into thinking a certain way about something from someone they know. On the contrary, the media can be seen as forcing a concept on the public, and is therefore less influential. While the media can act as a reinforcing

Opinion Leader Theory

Opinion leadership is conducted by an active media user who interprets the meaning of media messages or content for lower-end media users. Typically, the opinion leader is held in high regard by those who accept his or her opinions. Opinion leadership comes from the theory of two-step flow

agent, opinion leaders have a more changing or determining role in an individual's opinion or action. As a result of his findings, Lazarsfeld developed the two-step flow theory of communication. This theory advanced the concept that: the mass media influence certain individuals, and these individuals personally influence others. Subsequent studies of the 1952 and 1956 presidential elections by Campbell, Converse, Miller, and Stokes substantiated Lazarsfeld's findings.

Opinion makers in social media can be bloggers, journalists, or even message board members who command a certain following among their readers. There have been a number of metrics trying to assert the exact influence of social media and its opinion makers, however, the methodologies and approaches greatly differ. Also, there is a heated discussion of whether opinion leaders, influentials, or simply "very central people" (as seen from a network perspective) are able to generate viral postings. With the advent of Web 2.0, Web sites where consumers voluntarily contribute product reviews have prospered. By sharing their opinions on online forums, consumers also influence others' opinions and ideas. This leads to the formation of a network of trust among reviewers, with high-degree individuals acting in the opinion leaders. There are several famous Web sites that provide forums for user-generated content, providing mechanisms under which users can extend links to other users whose opinions or content they value, thus leading to a networked community. Examples of such Web sites include YouTube for sharing videos, IMDb and Rotten Tomatoes for opinion sharing on movies, and social networks such as Facebook, Myspace, and Twitter.

One of the key features of online review communities is that the network structure and individual behavior are dynamically changing over time. Over time, reviewers may receive new incoming trust links and contribute new reviews, both of which increase their attractiveness to other members of the community. Compared with offline social networks, the cost of changing structural and behavioral characteristics is smaller in online settings, and therefore the dynamic properties are salient.

In general, online opinion leaders differ from those identified and characterized in traditional studies of opinion leadership. Both online opinion

leaders and nonleaders are more similar than they are different in terms of the interactivity and messages that they post. All posters, regardless of opinion leader status, would classify their posts as "reactive messages" to express their opinion. The popularity of reactive messages challenges the general assumption that interactive messages are the most desired form of communication in the online, networked environment. The general public is not necessarily writing messages to seek information, challenging the assumption that media audiences are primarily information and opinion seekers. The online environment does not encourage interactive message exchanges among discussants; however, it does promote mutual discourse and role interchanges among participants of a news-oriented online community.

Opposition Videographer

Opposition videography, a form of video activism, is the practice of shooting political incidents and accounts as documentary evidence against an opposing political faction, such as filming warfare and political statements for release in court trials,

traditional media, and social media to mobilize civic resistance or affect a political campaign. Its dynamic impact on the political agenda has both encouraged and been compounded by the explosion of citizen journalism and the viral distribution of opposition videos through social networks and new media.

An example is witness footage that is e-mailed to others to circumvent social media firewalls, uploaded as YouTube clips, propagated through tweets and Facebook protest pages, and then broadcast via television news and documentaries. New media and citizen journalism is then reintegrated with “legacy” media, transforming one-way transmission media into two-way interactive media.

Videographers range from professionally trained camerapersons contracted to shadow a politician or campaign (such as Hassan Gol Khanban, the Iranian president’s videographer who defected while filming the president’s attendance at the United Nations), to citizens armed with cell phones, such as the volunteer brigade of video activists filming footage for the Free Syrian Army.

The practice of opposition videography stems from the use of video by political parties as propaganda in fundraising and advertising campaigns, as well as traditions of media activism and advocacy documentary pioneered by filmmakers such as John Grierson.

Filmmaker Sergei Eisenstein theorized that the politicized spectator is made to react demonstratively by the “agitational spectacle” of film, similar to receiving a shock or blow to the psyche. Jane Gaines extends this theory, describing spontaneous audience activism as a sign of the politicized body and an example of political mimesis, in which the sensationalized on-screen body produces a mimicry of emotion and visceral sensation in the body of the spectator.

Arab Spring

Since the Arab Spring, opposition videography has emerged as a growing phenomenon with startling power to mobilize civic engagement, fueled by increasing access to social media and camera phones. With the ubiquity of digital devices, opposition videography is even possible for a bystander with a mobile to create. This makes skills in mobile phone repair arguably more

powerful than a tank, challenging the “control paradigm” as discussed by McNair, by subverting the hegemony of society through media control.

Opposition parties now use cameras and social media as weapons, creating new tactics for activism. Video evidence of atrocities wins over new citizen supporters and soldiers to a movement, convinces opponent soldiers to defect and other nations to intervene, and documents evidence for war crimes trials and the court of international opinion on the World Wide Web. This serves as a direct and divisive way of wielding power by a people over a government, corroding the legitimacy of a regime in the eyes of its people and the world, and forcing response from foreign diplomats.

Videos said to incite violence often ignite calls for their censorship or banning from the Web (such as the outcry over *The Innocence of Muslims*), which in turn fuels controversy and debates about freedom of expression. In forcing politicians to respond, the power is proven to sit firmly in the hands of the videographer.

Whereas traditional documentaries often avoid or fictionalize the sight of bodies and ground wars, Patricia Rodden Zimmerman argues that insurgent documentary practice reclaims this ground, and employs reconnaissance and new technologies as a new offensive strategy.

Arab Spring opposition videos are often gruesome, evoking martyrology, which in turn increases their social media virality and becomes a rallying cry for revolution. An example is the death of “Neda,” an Iranian woman whose Twitter hashtag transformed her into an icon of Iran’s unrest. In cultures such as Iran, where traditions of honoring martyrs and revolting against tyranny are considered duties to God, tribute sites quickly proliferate. Mourning rituals also invoke the commemoration of deaths at cyclical intervals. This triggers further political crisis as the viral dissemination of videos of death then escalates a cyclical contagion of rebellion.

In response, opposition videographers are frequently labeled terrorists or accused of falsification by parties they oppose. Questions of impartiality, authenticity, credibility, and the use of video as propaganda then arise, together with issues of censorship, government controls on media and Internet access, and the safety and surveillance of citizen journalists.

Republican presidential and vice presidential candidates Mitt Romney and Paul Ryan in front of the cameras at a campaign rally in Norfolk, Virginia, on August 11, 2012. Romney's campaign was seriously affected by an opposition video that captured him saying, "There are 47 percent of the people who will vote for the president no matter what . . . who are dependent upon government, who believe that they are victims," at private fundraiser attended by wealthy donors in Boca Raton, Florida, on May 17, 2012.

To suppress activism and the power of opposition footage, regimes frequently impose media blackouts, and journalists become the first targets both on the front line and social media. Media outlets, frequently unable to obtain access or visas for foreign journalists, are forced to rely on footage by opposition videographers. Opposition factions also smuggle in journalists who risk their lives and those of their sources by both shooting and sharing footage. Faces are obscured, by filming over people's shoulders so that opposition supporters cannot be identified by facial recognition software and added to wanted lists.

With the rise of citizen journalism, there have also been sharp rises in the statistics of imprisoned and murdered videographers. One example is Syrian opposition videographer Ahmad Hamada, who filmed his own death during the siege of Homs this year.

Sue Curry Jansen states that inverse surveillance, such as the use of cameras as a "copwatch," becomes another form of activism that challenges existing power relationships. Social media and videography, both technologies of mobilization, are often combined with the use of open software for circumventing surveillance, turning software freedom and information control into issues of social justice. Patricia Rodden Zimmerman argues that the use of emerging technology as proactive ambush achieves an intervention in public discourse and both national and transnational media flows.

U.S. Politics

Video ambushes are frequently deployed both domestically and internationally, as exemplified by U.S. election tactics. Mitt Romney's reputation greatly suffered from the release of

opposition videos during the 2012 campaign. Some press speculated they originated from the McCain camp. The Democratic National Committee also appropriated Sarah Palin's clips into their videos targeting Romney's refusal to release his tax returns. The ensuing media storms effectively undermined and intervened in discourse on Romney's election platform. Technically labeled "opposition videos" because of their deliberate collection or reediting by a political opponent and their opposing position, any such material holds immense power to influence the press, voters, and national debate, particularly when virally disseminated through social media.

Conclusion

With the proliferation of video technology, the number of sites for cultural struggle has also multiplied. Opposition videographers now frequently rely on mapping-enabled camera technology, cryptography for privacy protection, hacking skills, and cutting-edge software to circumvent firewall blocks and surveillance, bringing liberation technology to the forefront of social media and the front line. This has reinforced the use and importance of the digital media landscape as a second battlefield, escalating a digital arms race between opposition videographers and the political parties they challenge.

Outparty Innovation Incentives

The outparty innovation incentives thesis was first articulated by David Karpf in his book *The MoveOn Effect: The Unexpected Transformation of American Political Advocacy*. In this book, Karpf takes a close look at the organizational layer of American politics, with an eye toward understanding the role of communication technology in reshaping the structure, practices, and tactics of new political organizations. The "MoveOn effect" refers to the new, technologically driven membership structures, as well as the fundraising and mobilizing tactics pioneered by the progressive advocacy organization MoveOn.org, starting in the early 2000s. Following MoveOn's successful example, a new generation of Internet-mediated progressive political organizations has emerged by similarly adopting and leveraging new technological innovations to redefine their membership and mobilize support. Through extensive analyses, Karpf notes that these organizations have mostly flourished on the left side of the ideological spectrum. In addressing the reasons for the gap between liberals and conservatives in Internet-mediated political group infrastructure, Karpf makes the strongest case for the outparty innovation incentives thesis.

Building on the concept of opportunity structures in social movement research, the outparty innovation incentive thesis postulates that the political party out of power has stronger incentives to pursue novel communication platforms, as well as campaign tactics and strategies, and it often more aggressively adopts innovative technological tools. Karpf suggests that this explains increasingly dramatic adoptions of new technological tools on the progressive side, starting in the early 2000s—a direct outcome of the progressive countermobilization efforts in the aftermath of the 2000, 2002, and especially the 2004 elections. In accordance with this main premise, the outparty innovation incentives perspective plays out similarly at three different levels of analysis—the political organization, candidate, and party network levels.

At the political organization level, Karpf's thesis suggests that whereas nascent political

organizations are born all the time, it is primarily during periods of oppositional politics that they fully leverage new technological affordances. Political organizations are more motivated to adopt new communication technologies when the political party they are affiliated with is out of power, and as a result they see the highest levels of donations and volunteer support during periods of countermobilization, when they can serve as outlets for political discontent. As MoveOn.org demonstrated, harnessing technological tools in countermobilization efforts can yield highly successful membership and fundraising patterns. In particular, by thinking of everyone on their e-mail list as a member, these organizations are able to reach the broadest possible audience and target their fundraising appeals to salient issues in the media at any given time.

At the candidate level, the outparty innovation incentives thesis submits that individuals who are thought to be long-shot candidates typically have strong incentives to adopt tactics that are both novel and unconventional. Given that the formal campaign rules established by law are not easily amenable to change, candidates who are widely expected to lose often attempt to alter the rules of the game instead, tinkering with the tactical norms and supporting technologies. As perhaps one of the most notorious examples of innovative campaigning, Karpf notes Howard Dean's 2004 campaign, fueled by a novel communication strategy that allowed supporters to self-organize through social networking sites like Meetup.com. Likewise, Barack Obama's Internet-mediated campaign in caucus states is precisely what sealed his Democratic presidential nomination in the 2008 election, where Hillary Clinton was largely presumed to be a frontrunner. In light of these examples, Karpf further notes that not all technologically innovative campaigns are bound to succeed. Such campaigns are able to alter prevailing strategic norms and rules only when they attract substantial financing and media attention, and when they are highly contested.

Last, at the party network level, Karpf suggests that power is a zero-sum game, whereby funding for innovative campaigning strategies replaces funding for older tactics. Given that new technologically driven strategies come attached to a new set of campaign consultants, at the expense of an

older set of consultants, it is only after a string of electoral losses that a party network readily adopts new campaign technologies. This trend, Karpf suggests, is bound to continue for as long as the American political system relies on professional consultants devoted to managing elections, regardless of what the prevailing communication technologies are at any given time.

Beyond the power dynamics among political parties in any given election cycle, there are other possible explanations for the adoption and use of novel technologies in the political arena. For example, one such explanation pertains to the specific makeup of a political constituency of any given candidate or party. Factors such as age, education, income, ethnicity, and urbanization have long been noted as important predictors of both Internet usage and political and civic engagement among voters. Consequently, it is possible that the makeup of the democratic constituency holds more explanatory power regarding Democrats' countermobilization efforts in the aftermath of the 2000, 2002, and 2004 election losses than their out-of-power status.

In addition, while the outparty innovation incentives thesis strikes a largely optimistic note regarding the role of new communication technologies in American politics, some scholars have cautioned against hyperbolizing their overall impact on democratic health. For example, in "The Myth of Digital Democracy," Hindman suggests that despite facilitating important transformation in political mobilization, new communication technologies have failed to give a voice to the voiceless. The vast majority of online political messages, he says, are being created and filtered by a relatively small group of media elites, in stark contrast to the Internet's early promise of citizen empowerment.

Oxford Internet Institute

The Oxford Internet Institute (OII) is a multidisciplinary department of the University of Oxford that carries out research and study of the relationship between society and the Internet. A number of the OII's research projects explore the role of social media in contemporary politics, often by employing innovative research methods made possible by the Web and related technologies.

History

The Oxford Internet Institute (OII) was officially founded in 2001, drawing on the leadership of Andrew Graham, master of Balliol College (University of Oxford), Professor Richard Susskind, Derek Wyatt (former member of the United Kingdom [UK] parliament), and the software entrepreneur and philanthropist Dame Stephanie Shirley, who endowed the Institute. From its inception, the OII has aimed to be the world-leading, independent center for the multidisciplinary study of society and the Internet. In 2002, Professor Bill Dutton was appointed as the OII's first director, succeeded in 2011 by Helen Margetts, professor of society and the Internet at the University of Oxford.

The OII's research base has grown with time, drawing on faculty, research associates, and visiting researchers from a range of disciplines, including law, history, informatics, geography, economics, political science, sociology, computer science, communications, anthropology, and education.

In 2003, the OII introduced its Summer Doctoral Programme, a two-week series of seminars and workshops for doctoral students from across the world studying some aspect of the relationship between the Internet and society. In 2006, the OII introduced a full doctoral program, a three-year course leading to a D.Phil. in information,

communication, and the social sciences. The OII again expanded its teaching offerings in 2009 with the introduction of a one-year master's degree in the social science of the Internet.

Research

The OII focuses its research around five broad themes: everyday life, governance and democracy, network economy, science and learning; and shaping the Internet (i.e., governance of the Internet). In exploring these themes, its researchers employ a variety of quantitative and qualitative methods, including traditional social science approaches (e.g., interviews, focus groups, ethnography, and surveys) and more innovative methodologies that are both appropriate to, and in some cases reliant on the Internet and related technologies. These include Web metrics (the study of the underlying structure of the World Wide Web), Web-based experiments, social network analysis, and big data analysis (research that makes use of large-scale sets of data generated by the use of Internet-related technologies by citizens, governments, firms, and social enterprise).

Researchers at the OII have managed major research projects funded by the UK government, the European Union, and private and third-sector donors. In addition, the OII's biannual Oxford Internet Survey (OxIS) serves as the UK's contribution to the World Internet Project. OxIS tracks Internet use and attitudes in the UK over time, beginning in 2003.

Social Media and Politics

While not always focusing on social media specifically, much of the OII's research speaks to the role of social networks in contemporary government and politics. The OII's past and ongoing contributions to this research area include the following:

- *The Oxford Internet Survey (OxIS)*: The OxIS tracks online political participation and government-citizen interactions on the Web in the UK. Since 2009, OxIS has incorporated questions on social media use into its survey questionnaire. This allows for the identification and analysis of trends in social media and political engagement, informing debates about the link between online and offline political

participation, and emerging forms of engagement made possible by new information communication technologies (ICTs) such as social media.

- *Digital-era governance and government-citizen relationships*: Led by Professor Helen Margetts, this project draws on interviews, hyperlink analysis, and experiments to assess how the Internet can enable citizens to contribute to the work of government and better retrieve information from public sector departments and agencies.
- *The Fifth Estate*: This research initiative is led by Professor Bill Dutton and explores the extent to which networked ICTs such as social media enable new sources of accountability in politics and government.
- *Geotag analysis*: Led by Dr. Mark Graham, researchers at the OII collect and analyse geotags (digital labels that attach longitude and latitude coordinates to online data) to identify where contributors to collections of online information and content, such as Wikipedia and Flickr, come from. When these social media sites address politically sensitive topics, such as land boundaries, controversial historical events, or political identities, this crowdsourced information can have important implications for real-world politics.
- *Public opinion and social media*: By analyzing the content of online political discussions on Usenet forums, Dr. Sandra Gonzalez-Baillon has identified a link between sentiments expressed online and election outcomes in the United States, providing an alternative to more traditional polling methods.
- *Collective action online*: Researchers at the OII explore how low-cost, widely used Internet technologies like mobile

phones and social media reduce the barriers that have traditionally complicated individuals' capacity to band together in support of common or socially desirable goals. For example, using Web-based experiments, Professor Helen Margetts is investigating the influence that social information cues have on an individual's propensity to sign petitions, vote, or donate to charities.

- *Ethics and the study of social media and politics*: As a new and fast-moving field, the study of online social networks lacks rigorous and agreed-upon ethical standards. The OII is also working to address this gap, an effort that may prove particularly relevant for the study of politics and social media, where concerns about protection of research participants' privacy and anonymity can be especially high.
- *Policy and Internet*: The OII edits a peer-reviewed journal titled *Policy and Internet* (published by Wiley Blackwell) that addresses the relationship between the Internet and public policy.

P

Palin Phenomenon

The Palin phenomenon refers to the sudden rise of Sarah Palin on the American national political stage. Her dramatic climb was followed by a relative decline in her political stature.

Palin, then Alaska governor, was tapped by John McCain as the Republican Party's vice presidential candidate on August 29, 2008. After McCain-Palin lost the election to Democrats Barack Obama and Joe Biden, Palin's popularity remained high, aided by her use of social media, a reality television show, two books, and scandals that kept her and her family in the news. She flirted with running for the Republican nomination for president in 2012, before deciding to sit out the race and continuing as a political commentator.

Palin's phenomenal rise from a relatively obscure governor to a national celebrity was spurred by her use of social media. Supporters liked her authenticity, plain style of speaking, strong conservative convictions, and ability to connect with average Americans. Her attractive physical appearance also aided her popularity. Critics focused on her lack of knowledge about government, her use of divisive language and tactics, and her sometimes ultraconservative views.

Sarah Heath Palin was born February 11, 1964, in Idaho. After three months, her parents

moved to Alaska to take jobs as teachers. Palin earned a degree in communications-journalism from the University of Idaho in 1987. She is married to Scott Palin and they have five children. She was twice elected to the Wasilla City Council, and then served as mayor for two terms. She became the first female governor of Alaska in 2006.

At her Republican National Convention speech Palin said, "You know they say the difference between a hockey mom and a pit-bull: lipstick." The line propelled many cartoons, columns, and commentaries. Palin often referred to herself as a "mama grizzly" in relation to the instincts of her home state's species of bear to protect their young. She was derisively referred to as "Caribou Barbie" for the reindeer of her home region and a reference to her background as a beauty pageant contestant.

During the presidential campaign, Palin often referred to herself and McCain as "maverick" politicians. When the McCain campaign showed concern that she was "going rogue" by wandering off message, Palin embraced the title. Her autobiography *Going Rogue* was released in November 2009, and became a best seller. She also wrote *America by Heart*, released in November 2010.

The Palin phenomenon was a boon for online sales once she was named to the presidential ticket. Online stores with campaign gear saw huge sales increases with McCain-Palin paraphernalia.

Two days before Palin was picked, there were no items related to Sarah Palin on eBay. The day of the announcement, there were 100 items up for sale. Within three weeks, more than 4,000 items related to Palin were sold. Other unrelated items were marketed with her name on them in order to drive traffic to sellers' sites.

Palin hosted an eight-week reality television show on TLC called *Sarah Palin's Alaska*. She signed a lucrative deal as a Fox News contributor, and did interviews from a studio at her Alaska home.

Social Media

Palin was a prolific user of social media in the months after her run for vice president. She used her Facebook status updates and tweets to announce policy opinions and generate attention. She had nearly 3.5 million "likes" from Facebook fans in 2012. Her status updates get tens of thousands of "likes" and spawn long conversations with hundreds and even thousands of comments. They also serve as a forum for Palin to comment on public issues.

Palin had 873,000 Twitter followers and tweeted nearly 1,300 times from the @SarahPalinUSA handle. Entries are mostly political commentary, with scattered remarks about her family. There is also a Sarah Palin news account (@SarahPalinLinks), touted as "Communication, Information, and Internet Activism in support of Governor Sarah Palin." It had more than 16,700 followers, and posted nearly 105,000 tweets. A SarahPalinRadio address focused on her radio appearances, and had more than 3,600 followers. There is also a "FakeSarahPalin" dubbed "Snowmobilin' right to the Naval Observatory," a reference to a favorite activity of Sarah and Todd Palin and to the vice presidential residence. The fake site had more than 10,000 followers.

Influence

While Palin played an important part in the rise of the Tea Party movement and Republican electoral success in 2010, her influence soon began to wane. Between February and April 2011, one study found that online posts about Palin fell by 38.2 percent, and social media mentions fell by 32 percent in that period. Part of the problem that Palin had in the campaign came from two

Former vice presidential candidate Sarah Palin at the Time 100 Gala in New York City on May 4, 2010. Palin's popularity started to fade after 2010, when a study from February to April 2011 found that online posts referring to Palin fell by 38.2 percent and social media posts dropped 32 percent.

network television interviews. In her interview with Charles Grodin of *ABC News*, she said that "you can actually see Russia from land here in Alaska." Another interview with Katie Couric on *CBS News* led to ridicule when Couric asked Palin to name a Supreme Court decision other than the proabortion *Roe v. Wade* case that she opposed. Palin could not name one, nor did she specify what newspapers she read.

Palin helped popularize the phrase "lame stream media" to refer to mainstream outlets. She also, through the use of social media, coined a new word. In response to plans to build a mosque near the World Trade Center site, Palin asked Muslims to "refudiate" it in a tweet. After she was criticized, she responded on Twitter that

“English is a living language.” “Refudiate”—combining the words *refute* and *repudiate*—was added in 2010 to the *New Oxford American Dictionary*.

Palin was parodied in pop culture through her portrayal by actress Tina Fey on *Saturday Night Live*. Fey resembled Palin, and mimicked her accent and mannerisms. The comedian won an Emmy for her performances.

An HBO movie *Game Change* from a book of the same name documented the 2008 campaign. Based on interviews by journalists, it showed the process of picking Palin, the pitfalls she and the McCain campaign faced in preparing for the vice presidential debate with Biden, and the pressures of the national spotlight. Actress Julianne Moore portrayed Palin in the film. It depicts a scenario whereby Palin was not fully vetted by McCain’s advisors before the selection.

In January 2009, SarahPAC was established to support conservative candidates endorsed by Palin. A controversial graphic posted to Palin’s Facebook page in March 2010 to solicit contributions gained attention after the January 2011 shooting of Congresswoman Gabrielle Giffords. The picture showed a map of the United States with crosshairs on the location of 20 congressional districts held by House Democrats targeted by conservatives. One of the districts was Giffords’ Arizona 8th District. Giffords was shot while holding an outdoor town hall meeting. No connection was ever found between the shooter and Palin or SarahPAC. After the 2012 presidential election, speculation began that Palin may run in 2016.

Participatory Politics Foundation

The Participatory Politics Foundation is a non-profit organization that is dedicated to increasing civic engagement by developing free Web tools that create opportunities for citizens to participate in their government. Based on their foundational belief that government proceedings should be accessible and understandable to the broad public, the Participatory Politics Foundation produces its flagship project OpenCongress.org. In this project, a blend of primary legislative documents is published alongside related news stories, editorials, and social commentary written by OpenCongress users. Through its maintenance of this Web site, the Participatory Politics Foundation strives to continue its mission to improve political processes by making them more participatory, creative, responsive, and accountable.

The Participatory Politics Foundation was co-founded by Tiffiniy Cheng, Nicholas Reville, and Holmes Wilson, and was publicly launched in February 2007. Since the organization’s founding, David Moore has served as the executive director, and is also the program manager of OpenCongress.

The operating structure for the Participatory Politics Foundation is based on six principles that establish its organization as: free for everyone, open source, open standards, nonprofit, and nonpartisan. “Libre content, for social sharing” constitutes a final principle, which means that its content is free for sharing in social venues such as online social media platforms, educational contexts, media outlets, and other civic causes. The Participatory Politics Foundation contends that citizens should do more to civically engage, and that the Internet offers opportunities for citizens to improve communication with political representatives and to become more informed in the government’s proceedings.

The creation and operation of the Participatory Politics Foundation’s Web site OpenCongress is founded on these fundamental beliefs. OpenCongress was conceived of during the wake of the 2004 election in an effort to sustain the excitement among the electorate that was stimulated by the election. The designers of this project

sought to aggregate existing online news concerning congressional activities, and to package it in a user-friendly interface. After partnering with the Sunlight Foundation in 2006, OpenCongress launched a public version of its site in February 2007. Since this time, OpenCongress has existed as an open source Web site that publishes legislative records with accompanying news stories, summaries of bills, and blog posts. For each bill, there is also a designated area for OpenCongress users to post comments pertaining to given government proceedings. For example, when clicking on H.R. 624, the “Cyber Intelligence Sharing and Protection Act,” users can view the bill’s text, status, sponsors, committees, and votes, as well as an aggregation of news articles, blog coverage, and comments written by OpenCongress users that show their opinions and levels of support or opposition in relation to a given bill.

In comparison to traditional news stories about political issues, OpenCongress aims to provide more detailed and in-depth information concerning legislative action by linking to the text written in bills. Moore and other staff members who maintain the Web site attempt to reduce the complexity of legal language contained in bills by providing relevant context and analysis. To further enhance users’ abilities to easily access information, OpenCongress encourages users to personalize their experience by creating a free account, which then gives them the option to track specific bills and receive reminders when topics they care about are scheduled for votes. For example, a user may select to follow the issue of “health policy,” consequentially allowing them to gain notifications when major bills related to health policy are approaching a vote, and alerting them of the results.

As part of its objective to increase citizens’ political participation and interaction with their political leaders, OpenCongress features comment boards on pages for every bill, senator, and representative. These designated virtual spaces encourage users to discuss issues and evaluate their political landscapes. Citizens can also voice their level of support for each bill by casting an “aye” or “nay” vote, and can give senators and representatives a personal approval rating, using a scale of 1 to 100. Results from these votes and approval ratings are publicly displayed in an

effort to demonstrate to members of Congress how the OpenCongress community stands on issues. These features seek to open communication between citizens and their political leaders in a way that was not possible prior to the creation of this site.

OpenCongress.com has generated a vast audience of approximately one million visits per month, as well as a user community of more than 300,000 members. In 2008, the site crashed as a result of the number of citizens attempting to access it following a controversial decision wherein U.S. Treasury Secretary Henry Paulson asked Congress to entrust him with \$700 billion in taxpayers’ money. The online project also attracts viewers from a number of online blogs and news sites such as the *New York Times*, the *Washington Post*, and PBS that have linked to OpenCongress.org on their sites. For example, in a September 10, 2009, article published on *The Atlantic* online, journalist Chris Good linked to a blog post on OpenCongress to provide primary text and in-depth analysis related to a specific bill.

The Participatory Politics Foundation has developed two sibling nonprofits, the Participatory Culture Foundation and Center for Rights, both of which operate on similar principles that citizens should employ the Internet to enhance the openness and accessibility of their government. The Participatory Culture Foundation focuses on supporting democratic media by creating resources for citizens to produce and publish digital videos. By designing open source software applications they allow individuals and organizations to create broadly accessible videos that empower communities. The Center for Rights is a nonprofit that advocates for the public interest, digital rights, Internet freedom, and open Web innovation through empowering individuals to use the Internet for public good by participating in a range of civic campaigns that are linked to its Web site.

Through its continued efforts to maintain and improve OpenCongress.org, the Participatory Politics Foundation utilizes the advantages of open source Internet tools to enhance civic engagement.

Peer to Peer

Peer to peer (P2P) refers to a self-organizing computer network of equals in which each computer (which is an autonomous entity) can act as a client or server for the other computers, thus allowing shared access to various distributed resources (e.g., files or peripherals), without the need for a central server. In the peer-to-peer model, any node (computer) is able to initiate or complete any supported transaction. Peer nodes may differ in local configuration, processing speed, network bandwidth, and storage quantity. In this model, peers can act both as suppliers and consumers of resources, in contrast to the traditional client-server model, where only the server sends, and clients receive.

P2P networks can be set up within the home, a business, or over the Internet. Each network type requires all computers in the network to use the same or a compatible application to connect to each other and access resources found on the other computer. P2P networks can be used for sharing content in a digital format (e.g., audio, video, or data).

The first P2P distributed system platform appeared in the 1990s. P2P gained wide acceptance with the introduction of the Napster file sharing system in 1999. Napster was a pioneering P2P file sharing Internet service that emphasized sharing audio music files encoded in MP3 format. Although it became very successful, the company ran into legal difficulties over copyright infringements.

Today, many widely used applications and tools are based on the P2P model. Skype, the most widely used Internet phone application, was P2P technology. Instant messaging (IM) systems and online chat services are also based on the P2P model. Other well-known applications that utilize P2P are file-sharing systems such as BitTorrent services. The P2P model is quite extensively used on the Internet today. Many Internet service providers claim that more than 50 percent of Internet traffic is generated by P2P applications.

The P2P model offers many advantages. The failure of one peer does not compromise the whole network. The decentralized nature of P2P networks increases robustness because it removes the single point of failure that can be inherent in a client-server-based system. Also, the lack of a system administrator makes the network easier and faster to set up and maintain. Each peer is responsible for controlling its data and resources. Of course there also disadvantages. Risky or illegal data can be distributed on P2P networks because peers are connecting to untrusted sources, as opposed to an administrative server. Also, the removal of such data is not an easy task because there is no central control that manages the content that circulates in the network.

The P2P concept has inspired new structures and philosophies in many areas of human interaction. P2P is not restricted to technology anymore, but also covers social processes. Social P2P processes are currently emerging throughout society. The P2P concept can be applied as a general technical/social/cultural movement to provide content and services. Each peer (computer or the user that operates it) can be a creator or distributor of content to other peers, not simply a consumer of content provided by a centralized system. The more peers who participate in such peer-to-peer networks will result in more content available to all peers—this is also one of the main characteristics of social networks. Yochai Benkler has proposed the term *commons-based peer production* to designate collaborative projects (e.g., free and open source software such as Wikipedia).

Associated with peer production are the concepts of peer governance, peer property, and peer distribution. Peer governance refers to the manner in which peer production projects are managed.

On the other hand, peer property denotes the type of licenses that recognize individual authorship but not exclusive property rights (e.g., the General Public license and the Creative Commons licenses) and peer distribution refers to the manner in which peer-produced products are distributed. Finally, it is worth noting that emerging collaborative P2P systems are investigating the concept of diverse peers who can bring in unique resources and capabilities to a virtual community.

Pelosi, Nancy

Nancy Pelosi is an American politician from California who served as the first female speaker of the House of Representatives, and who has held leadership positions for House Democrats for more than a decade. As the representative of one of the nation's most strongly Democratic congressional districts, Pelosi is considered to be very progressive in most of her positions. Because her

district represents an area near California's Silicon Valley, Pelosi has often voted for legislation that favors companies involved in high-technology endeavors. Pelosi was an early adopter of many social media, and has used these channels to communicate with constituents and other interested parties. Perhaps because of her interest in social media, Pelosi was an adamant early opponent to the proposed Stop Online Piracy Act (SOPA).

Background

Nancy Particial D'Lesandro was born in Baltimore, Maryland, in 1940. The sixth and youngest child of Annunciata "Nancy" Lombardi and Thomas D'Alesandro, Jr., she was educated at the Institute of Notre Dame, an all-girls Catholic high school in Baltimore, and received a B.A. in political science from Trinity College in Washington, D.C., in 1962. Pelosi's family had a record of public service, and many of her relatives were involved with the Democratic Party. Married to Paul Pelosi in 1963, she and her husband moved to New York City after their wedding, ultimately moving to San Francisco in 1969.

Pelosi and her husband have five children: Nancy, Christine, Jacqueline, Paul, and Alexandra. Although Pelosi devoted much of her time to rearing her children after the family's move to California, her political heritage is strong. Her father served as a member of the U.S. House of Representatives from 1939 until 1947, at which point he ran for and served as mayor of Baltimore for 12 years. Her brother, Thomas D'Alesandro III, also served as mayor of Baltimore between 1967 and 1971. Pelosi's brother-in-law, Ronald Pelosi, was a member of the San Francisco County Board of Supervisors, and was well-connected in Democratic Party circles in California. As a result, Pelosi found easy entry into Democratic politics, soon becoming friends with Phillip Burton, the representative from California's 5th Congressional District, and one of the leaders of the California Democratic Party.

Political Career

Pelosi was elected to the Democratic Party's National Committee as a member from California in 1976, a position she would hold for the next 20 years. Pelosi was elected as the northern California Democratic Party chair in 1977, and

Speaker Nancy Pelosi in 2007. Pelosi served as the first female speaker of the House during the 110th and 111th Congresses after serving as the House minority leader after Richard Gephardt's resignation in 2002.

also served as the chair of the California Democratic Party from 1981 through 1983. In these positions, Pelosi was able to form a network of political allies across the United States. Working as the finance chair of the Democratic Senatorial Campaign Committee (DSCC), Pelosi raised campaign funds for candidates across the United States, serving in this role from 1985 through 1986. Although she was defeated by Charles Manatt in her 1985 attempt to be elected chair of the Democratic National Committee, the death of her friend Phillip Burton in 1983 would eventually open up the seat that Pelosi has held through the past several decades.

After Burton's death, his widow Sala won a special election to his position and won re-election to the House in 1984 and 1986. When Sala Burton was diagnosed with what proved to be terminal cancer, she tapped Pelosi to be her successor. Narrowly defeating City of San Francisco Supervisor Harry Britt with 36 percent of the vote to his 32 percent in the special election that was held after Sala Burton's death, Pelosi was elected to Congress for the first time in 1987. Pelosi's district, which comprises 80 percent of the City of San Francisco, is reliably liberal, comprised of the largest number per capita of

same-sex couples in the United States, and covering only slightly more than 110 square miles. Pelosi has been re-elected each time since she first ran for the seat, often pulling more than 80 percent of the votes cast.

After becoming a member of the House of Representatives, Pelosi was appointed to the Appropriations Committee and the Intelligence Committee, serving on the Intelligence Committee until she joined the Democratic leadership in 2001. In that year, her party caucus chose Pelosi to serve as House assistant minority leader (minority whip), serving under Minority Leader Richard "Dick" Gephardt of Missouri. In 2002, Gephardt resigned from the House of Representatives in order to pursue the Democratic nomination for president. At that time, Pelosi was selected to replace him, becoming the first woman to serve as minority leader for either the Democratic or the Republican parties. After the Democrats took control of the House of Representatives following the mid-year elections of 2006, Pelosi was nominated by her caucus to serve as the first female speaker of the House, assuming that office in January 2007. In addition to being the first woman to serve as Speaker of the House, Pelosi was also the first Italian American and only the second person from the west coast to be selected to that office.

Before the 2006 elections, Pelosi had announced a 100-Hour Plan that detailed legislation that the Democratic Caucus would attempt to pass during the first 100 hours of the new congressional term. The 100-Hour Plan agenda included reforming House rules so that lobbyists' influence was curtailed, instituting a pay-as-you-go plan to reduce the deficit, enacting all recommendations of the September 11 Commission, increasing port security, granting federal funding to stem-cell research, requiring Medicare to directly negotiate with drug manufacturers to reduce the cost of prescription medications, halving interest rates on student loans, and ending large subsidies to petroleum companies. Under Pelosi's leadership, the House passed all of this legislation between January 9 and January 18, 2007, taking only 87 business hours to do so. While some of this legislation died in the Senate, the 100-Hour Plan helped Pelosi establish herself as an effective leader who was able to push through a legislative agenda.

Pelosi served as speaker of the House through the 110th and 111th congresses, stepping down only after the Democratic Party's loss of 63 seats, and the majority, to the Republicans. Although she was forced to step down as speaker, the Democratic Caucus again elected Pelosi House minority leader following the 2010 and 2012 elections. In this role Pelosi has worked to promote President Barack Obama's legislative agenda while serving her constituents and her party. In particular, Pelosi has been known for advocating for lesbian, gay, bisexual, and transgender (LGBT) rights, increasing environmental protections, raising the minimum wage, protecting civil liberties, tying foreign aid to reductions in human rights abuses, and opposing military spending and the war in Iraq. Pelosi was a major advocate for President Obama's Patient Protection and Affordable Care Act of 2010, delivering 219 House votes in favor of the legislation. Proponents of the health care legislation praised Pelosi for pushing for health care reform's passage at a point when its prospects for passing seemed bleak.

Use of Social Media

Like most politicians, Pelosi uses a variety of social media to communicate with her constituents, the general public, and those interested in a variety of issues she supports. To that end, Pelosi maintains two Web sites, a Twitter account, Facebook page, Flickr account, and news feed service. Pelosi's office Web site contains a variety of information, including updates on legislation, news releases, ways for constituents to contact her, community funding resources, answers to frequently asked questions, ways to seek assistance with federal agencies, a synopsis of her congressional district, and biographical information. Her second Web site, democraticleader.gov, chiefly focuses on her political agenda, and includes a blog, photographs, a calendar of appearances and meetings, summaries of proposed bills, and links to the *Congressional Record*. Pelosi's Twitter account, which has over 250,000 registered followers, transmits regular tweets related to news events or pending legislation. On her Facebook page, Pelosi includes photographs, links to other organizations, and postings related to her activities and travels. Pelosi's Flickr account contains a variety of photographs, including those of the

minority leader, her family, constituents, and those involved in causes she supports. Pelosi also offers a news feed service that allows constituents and other supporters access to legislative updates and political speeches.

Stop Online Piracy Act

Since the Internet became popular with the general public, the holders of the copyrights for recorded music, films, television programs, and other intellectual property have struggled to control access to their property and to minimize the pirating, copying, or other unauthorized sharing of that material. Between 1999 and 2001, for example, the peer-to-peer file sharing service Napster permitted users to share audio files, often in an encoded audio format known as MP3. While some transactions via Napster included the legitimate sale of audio files, the vast majority of the service's 25 million users shared over 80 million files, many containing copyrighted material, for free. This filesharing was in violation of the copyright owners' and performers' rights, and amounted to billions of dollars of lost royalties. Filesharing also was alleged by the major record companies to have caused their sales to precipitously drop. In response, the Recording Industry Association of America (RIAA)—the trade association representing the record companies—filed suit against Napster and others for copyright violations. Although the RIAA was ultimately successful in forcing Napster into bankruptcy, a variety of other Web sites and services almost immediately sprang up that allowed unauthorized file sharing to continue. While the RIAA and others continued to file lawsuits to stop illegal filesharing, relief came too late to stop the decline in sales.

The creators of intellectual property and the copyright holders of those creations lobbied Congress to grant them further protections to prevent unauthorized sharing. In response to these requests, a bipartisan group of congressmen and senators worked to develop legislation that would curtail online piracy. Representative Lamar Smith, a Republican from Texas, introduced SOPA in the House of Representatives with 13 cosponsors. SOPA was related, although somewhat different, to a similar bill in the Senate, the Preventing Real Online Threats to Economic Creativity and Theft of Intellectual Property (PROTECT IP) Act (PIPA),

introduced by Senator Patrick Leahy, a Democrat from Vermont, and 33 cosponsors. SOPA was intended to thwart online piracy of copyrighted intellectual property and counterfeit goods. To do this, SOPA proposed giving law enforcement agents increased ability to fight such infringements. SOPA allowed law enforcement agents and rights holders to identify infringing Web sites, and then seek a court order barring advertisers and payment facilities from engaging in business with the infringer. SOPA also permitted court orders that would bar search engines from linking to infringing Web sites, and to require Internet service providers to block access to the offending Web sites. SOPA made unauthorized streaming of copyrighted material illegal, and increased maximum penalties for violating the law to five years in prison.

SOPA enjoyed broad support from an array of rights holders, creative types, and labor unions. Specifically, SOPA was supported by such organizations as the Actors' Equity Association; CBS, Inc.; the Directors Guild of America; the Association of American Publishers; the National Basketball Association (NBA); the National Football League (NFL); Warner Music Group; the Motion Picture Association of America (MPAA); Random House; the National Governors' Association; the International Brotherhood of Teamsters; and many others. Both of California's senators, Barbara Boxer and Dianne Feinstein, supported the legislation. The supporters of SOPA maintained that the act was necessary to strengthen the enforcement of copyright laws, especially as they applied to Web sites owned and operated by those outside of the United States.

Despite this, Pelosi opposed SOPA. Pelosi believed that SOPA threatened free speech and innovation, while also giving law enforcement agents the ability to block entire Internet domains in order to be able to block a lone offending Web page. Although initially Pelosi was one of the few public opponents of SOPA, this stance was not totally surprising. Historically, Pelosi has been an ardent supporter of civil liberties, so her unwillingness to impede speech is not a shock. Some have also suggested the involvement of many of Pelosi's constituents and donors in companies affected by the law, such as Yahoo!, Google, Facebook, Twitter, and eBay, all of which opposed SOPA.

Pelosi was joined in her opposition by conservatives such as California Republican Representative Darrell Issa, and libertarians such as frequent presidential candidate Ron Paul. In this opposition, Pelosi was joined by many colleges, universities, and libraries, who felt that SOPA would unnecessarily impede their operations. A variety of online protests took place, and many technology companies worked to stimulate opposition to SOPA. After President Barack Obama stated that he would not support legislation that could lead to the diminishment of innovation, limitations on free speech, or reduced Internet security, opposition to SOPA grew, culminating in a vote postponed in both the House and the Senate. Pelosi continues to oppose legislation that would impede social media.

Pence, Mike

Elected to the U.S House of Representatives in 2000, Congressman Mike Pence (R-IN) quickly became a leading conservative voice in Congress. By 2005, the conservative weekly publication *Human Events* named Pence its "Man of the Year." After only eight years in Congress, he was unanimously elected by his peers to the third-ranking leadership position in the House—chair of the House Republican Conference. In this

capacity, Pence led the development and dissemination of the GOP caucus message and promoted its members. As a former radio talk show host, Pence understood the need for regular, ongoing communication with a wide variety of constituents. He was an early adopter of communicating with constituents via the Web and social media. Conservative activists and the media speculated about Pence as a potential GOP candidate for president in 2012, but he chose instead to run for Indiana governor. In 2012, Congressman Pence was elected governor of Indiana, succeeding fellow conservative Mitchell E. Daniels, Jr.

Early Life and Career

Mike Pence was born in Columbus, Indiana, on June 7, 1959, to Nancy and Edward J. Pence, Jr. He attended Columbus North High School, and graduated from Hanover College in 1981 with a B.A. in history. Pence earned his J.D. from the Indiana University McKinney School of Law in 1986. On June 8, 1985, Pence married his wife, Karen, an elementary school art teacher.

Following graduation from law school until 1991, Pence worked as an attorney. However, he entered politics early, running for Congress only two years after graduation. He lost that race to veteran Democratic Representative Philip R. Sharp. He attempted again two years later to take over Sharp's seat, but lost by 19 points in a largely negative campaign. After the bruising congressional race, Pence took a break from politics and in 1991 began serving as president of the Indiana Policy Review Foundation, a nonprofit education foundation focused on state and municipal issues.

By 1994, Pence's local conservative talk radio show, *The Mike Pence Show*, grew into syndication and began airing statewide on 18 radio stations. The show ran weekdays until September 1999. From 1995 until 1999, Pence also hosted a Sunday morning public affairs television show in Indianapolis. The experience Pence acquired during this time was invaluable. His familiarity with the media would serve him well in later elections and in his capacity as spokesperson for the House Republican Caucus.

Pence never gave up on running for elected office, and in 2000 he ran for the 6th Indiana Congressional District following the retirement of fellow Republican David M. McIntosh, who

unsuccessfully ran for governor. This time, however, Pence beat five other Republicans in the primary election, and a Democratic lawyer in the general election, to win the congressional seat he would hold until December 2012, leaving only after winning his race to become governor of Indiana.

Congressional Service

Pence served as chair of the Republican Study Committee from 2005 to 2007. The committee is made up of conservative Republican House members, generally advocating for an agenda they describe as supporting limited federal government, strong national defense, individual and property rights protection, and measures that support traditional family values. When Pence left the leadership of this organization, membership had grown to more than 110 members.

In 2006, Pence ran for House Minority Leader, but was trounced by Ohio Congressman John Boehner by a vote of 168–27–1. Undeterred and with the support of Boehner, Pence ran in 2008 and was unanimously elected by his peers to the third-ranking leadership position—chair of the House Republican Conference. Pence served in that position until resigning to run for governor of Indiana.

Before leaving Congress, Pence served on the U.S. House Committee on Foreign Affairs. He was vice chair of the Subcommittee on the Middle East and South Asia. He also served as a member of the U.S. House Committee on the Judiciary. On that committee, Pence was vice chair of the Subcommittee on the Constitution and a member of the Subcommittee on Intellectual Property, Competition, and the Internet.

Social policy. In his official biography, Pence describes himself as “a Christian, a conservative, and a Republican, in that order.” This quote defines Pence and his approach to politics. It has consistently reflected the positions, votes, and issues that Pence has championed throughout his public life and career. In fact, Brian Howey, longtime Indiana political writer, wrote after Pence's election to the governorship that he would be the “most socially conservative governor in modern Indiana history.”

Pence voted 100 percent in support of the positions taken by the National Right to Life

Committee in each of the congressional sessions since 2000. He has a 100 percent lifetime rating from the American Conservative Union, and in 2011, he scored 100 percent in *National Journal* ratings as a “conservative on social policy.” He also scored 100 percent in 2011 from the Family Research Council, a national nonprofit Christian advocacy organization.

An example of Pence’s commitment to conservative social issues is found in his introduction and longtime defense of the Title X Abortion Provider Prohibition Act. Originally introduced in 2009 by Pence, the bill sought to prohibit federal funding for family planning to any organization that performs abortions, including Planned Parenthood. Pence maintained his fight for this controversial measure, which became known as the “Pence Amendment,” until April 2011, when it eventually passed the House by a vote of 241–185–1.

Fiscal policy. Pence is a vocal supporter of smaller government and an outspoken opponent of federal deficits. He opposed all the corporate bailouts, including the bailout of the auto industry, even though U.S. automakers are important employers in the state of Indiana. He has supported tax cuts, flat tax proposals, and a multitude of measures aimed at reducing federal spending and federal deficits. He has done so without regard to political party, opposing both Republican and Democratic presidential measures that would increase federal spending.

He often cites Ronald Reagan as his touchstone on fiscal policy. In a 2010 address to the Detroit Economic Club, Pence outlined an “incentive-based, growth agenda” he called S.T.A.R.T. The acronym stands for sound monetary policy, tax relief and reform, access to american energy, regulatory reform, and trade. This address encapsulated Pence’s longtime views on supply-side economics, smaller government, and lower taxes that he championed throughout his career in office.

Two striking examples of Pence’s commitment to his economic philosophy includes his cosponsorship with Rep. Jeb Hensarling (R-Texas) of a constitutional amendment to limit the amount the federal government could spend to only “one-fifth of economic output of the United States of America,” and his pledge not to request any

federal spending earmarks. The latter of which he remained committed to, even when local civic leaders in his own congressional district requested federal financial assistance to pay for reconstruction after serious damage was caused by a series of tornadoes and floods.

His strong commitment to conservative fiscal policy has earned him 100 percent favorable ratings from groups such as Americans for Tax Reform, Citizens Against Government Waste, and FreedomWorks, a grassroots advocacy organization that supports limited government and low taxes.

Social Media and the Internet

Shortly after arriving in Washington in 2001, Pence joined the Congressional Internet Caucus. The caucus is a bipartisan group of House and Senate members who advocate for greater government Internet utilization and for members of Congress to use the Internet to better communicate with constituents.

Almost immediately, Pence provided online access to his office. In 2002, Pence was awarded a Golden Mouse, and in 2003, a Silver Mouse from the Congressional Management Foundation. The foundation recognizes members of Congress who “best use the Internet to communicate with and serve citizens.” In 2010, Pence was recognized with a Platinum Mouse for his leadership of the House Republican Conference’s Web site.

When Pence was elected chair of the House Republican Conference, President Obama had just won the election and ushered in a new era of political campaigning via social media. At this time, the Republican Party lagged the Democrats in adoption of new media. To remedy the disparity, Pence launched a number of measures including the first New Media Competition, which pitted Republican House members against one another to demonstrate who could gain the most followers, friends, and subscribers to the respective social media platforms.

According to the House Republican Conference, when Pence took over as chair in 2009, only 56 percent of House Republicans used YouTube, 37 percent used Facebook, and 28 percent used Twitter. By 2010, social media adoption increased dramatically to 89 percent, 79 percent, and 64 percent, respectively.

Facebook

While the Republican Party was discovering the power of social media, Congressman Pence had already deciphered the code to communication in the new age. At the Republican National Committee Tech Summit in 2009, Pence remarked that he ranked ninth among members of Congress in the number of friends on Facebook. This milestone is not surprising, since he began using Facebook in 2008.

Pence quickly adopted the platform as a formal communication tool. Most notably, he announced his intention to run for House Republican Conference chair in 2008, announced to supporters in 2010 his decision not to run for the U.S. Senate, in 2011 announced of his candidacy for governor

President Barack Obama talks with Governor Peter Shumlin (D-VT), center, and former congressman and now-Governor Mike Pence, (R-IN), after a meeting with the National Governors Association at the White House on February 25, 2013.

of Indiana, and in 2012 announced his choice of lieutenant governor on his Facebook page. By the time he left Congress, Pence had more than 53,000 “likes” on his Facebook page.

Pence did not include links to his Facebook page from his congressional Web site. Because he only has one official page, he has used it for both political and congressional business. Given the political element, it is possible Pence chose not to feature a Facebook link on his official Web page for that reason.

Twitter

Pence began officially tweeting in early 2010. He utilized a Twitter handle specifically for official congressional business, @RepMikePence. With over 38,000 followers, Pence’s tweets ran the full spectrum, from local items such as job fairs based in his district to national issues such as health-care reform and military concerns. He tweeted on average eight to 10 times per month on his official handle. His Twitter feed was prominently featured on his official congressional Web site. Constituent tweets were to remain on the feed; however, the congressman largely chose not to respond via Twitter to constituent comments or questions.

Pence also adopted Twitter for campaigning, utilizing @pencecampaign throughout his bid for Indiana governor. Twitter was regularly used, sometimes tweeting as much as 10 times a day. The campaign tweeted under three different hashtags: #mike4gov, #pence, and #HoosierFact-Friday, where he also tweeted about Indiana history and trivia.

YouTube

In Congress, Pence utilized YouTube, displaying his channel, Congressman Mike Pence (IN-06), prominently on his congressional Web site homepage. By the end of his 2012 term, he had nearly 700 subscribers and over 643,000 video views. His congressional use of YouTube dates back to early 2009, with over 230 videos posted in that year alone. Pence’s congressional channel had nearly 520 videos posted by the time he left Congress in 2012.

His posts varied widely, from local television interviews on district issues to in-depth interviews on *Meet the Press* and C-Span. On the channel,

constituents can find video on the congressman's House testimony, major policy speeches, news conferences, and public service announcements.

The congressman added more than 150 video clips to his favorite playlist. These include many clips of Speaker of the House John Boehner, House Republican leadership news conferences, other House Republican members speaking on a variety of policy issues, and weekly Republican video addresses. Particularly poignant clips include memorials to an Indiana guardsman killed in Afghanistan, tributes to the U.S. military services and victims of natural disasters.

While his official YouTube channel is extensive, his campaign channel, Pence4Indiana, is not as comprehensive. Started in 2011, the campaign channel hosted more than 40 videos, largely comprised of advertisements from the 2011 to 2012 campaign. This video channel includes clips from his wife Karen, as well as other more personal appeals directly from the congressman. While only comprised of a small number of videos, they were viewed nearly 37,000 times.

Conclusion

Mike Pence's background in media and his recognized talent as a communicator may contribute to his interest in and use of social media platforms. Additionally, his choice to cochair the Congressional Caucus for Freedom of the Press highlights his interest in open access to government and congressional action. While his use of social media is not exclusive or exhaustive, it is, however, deep and defining. He was an early adopter of new media, and would be expected to continue to lead through use of the various platforms as he continues in elected office.

Pentagon Digital Engagement Team

The Pentagon Digital Engagement Team (PDET) is an initiative developed in 2008, aimed at enhancing the United States' online presence in the Muslim world in order to rebut Islamic extremists who use the Web and social media to disseminate anti-American propaganda.

The PDET, which is based in U.S. Central Command (CENTCOM), uses the practices of public diplomacy in an effort to sway public opinion in strategically important areas of the world.

Public Diplomacy and the War on Terror

The PDET is part of a broader U.S. effort to use diplomacy and persuasion to counter the rhetoric of extremists in countries where the United States is militarily involved. During the war on terror, the United States has sought to supplement its military efforts with diplomatic initiatives aimed at winning the "hearts and minds" of individuals who are vulnerable to extremist propaganda. In contrast to traditional diplomacy, which focuses on persuading the political elites of countries, public diplomacy relies on interaction with the general public in a target country. This interaction

can include U.S.-sponsored radio and TV broadcasts, educational exchanges, and in the case of the PDET, interaction between U.S. officials and people in the Muslim world via Web sites and social media.

Operation of the PDET

U.S. efforts in the area of Internet diplomacy began in 2006, with the formation of the State Department's Digital Outreach Team, based in the Department's Bureau of International Information. The 10-person team was tasked with commenting on Arabic, Persian, and Urdu language blogs and Web sites that featured content critical of U.S. foreign policy; when commenting, the team members would identify themselves as representing the U.S. government, and would challenge the factual premises of anti-American statements.

The PDET, the Pentagon's version of this effort, was developed in 2008, and was launched in January 2009. The team is located at MacDill Air Force Base in Tampa, Florida; this is the headquarters of CENTCOM, which is responsible for U.S. military operations in the Middle East, central Asia, and north Africa. Major David E. Never, the former chief of the team, told a reporter for the *New York Times* that the PDET seeks to "counter extremist ideology, promote cultural awareness and explain U.S. interests." As Never notes, the team wants to engage in dialog with individuals who are moderates, rather than radicals; unlike extremists, moderates are more likely to be receptive to new information offered by team members.

The team, which is comprised of CENTCOM officials and private contractors, includes 20 speakers of Arabic, Dari, Persian, Pashto, Urdu, and Russian, and focuses on Web sites and social media outside of the United States. When commenting on a Web site, members of the team acknowledge that they are with CENTCOM, and are attempting to advance the interests of the U.S. government. When anti-American messages or articles are located, the team aims to provide a rapid turnaround. Specifically, after identifying postings or articles that distort U.S. policy, members of the team request "Permission to Engage" from the team leader, and then compose a response; this process is usually completed within a single day.

According to Never, in these interactions, members of the PDET seek to "respectfully deflect baseless and often irrational insults, confront adversaries with factual evidence and expose extremist propaganda that might otherwise go unrefuted." An article in the *Tampa Bay Tribune* recounted a typical exchange between a team member and an anonymous Internet user. In this case, Lieutenant Commander William Speaks, a public affairs officer, participated in a discussion thread for an online news story about explosions in the Pakistani city of Lahore. In response to a commenter who claimed that the Obama administration had "dragged" Pakistan into a war for U.S. gain, Speaks pointed out the harm caused by the domestic terrorists in Pakistan. He noted, "it is your countrymen that are conducting these attacks, it is homegrown insurgency and your own war."

In another instance, a Persian-speaking contractor working for the PDET engaged in an extended conversation on a comments thread, attempting to rebut posters who argued that the alliance between the United States and Pakistan was of no benefit to the people of Pakistan. The team has also dealt with claims that Osama bin Laden is still alive, as well as false claims of indiscriminate violence against Afghani civilians committed by U.S. soldiers.

Engagement Versus Cyberwarfare

Although the aim of the PDET is open exchange with those critical of U.S. policy, other aspects of the United States' online strategy have been done in a covert manner. In 2011, several news outlets reported on CENTCOM's 2010 contract with Ntrepid, a company that produces software designed to obscure the identity of users. Specifically, the \$2.7-million contract would provide software so that U.S. personnel could create up to 10 online personas, and use these so-called sock-puppets to leave pro-American comments on foreign blogs and news sites. Moreover, the software can obscure the location of the user's IP address, making it appear as if a user was located outside of the United States. Like the PDET, this program would focus only on users and sites outside of the United States, and would exclude popular social media sites such as Twitter and Facebook.

The United States has also directly targeted the Web sites of extremists, with the aim of disabling

them or altering their content. For example, in May 2012, in a speech to Special Operations Command in Tampa, former Secretary of State Hillary Clinton revealed that the Center for Strategic Counterterrorism Communications at the State Department had successfully hacked a Web site run by Al Qaeda in Yemen. The United States then replaced the anti-American content with information about civilians killed in Al Qaeda attacks.

Effectiveness of Digital Engagement

Proponents of these programs argue that in order to succeed in the war on terror, the United States must adopt the persuasive tactics that are used successfully by extremist groups. For example, in 2011 testimony before the Senate Armed Services committee, former CENTCOM Commander General James N. Mattis argued that it was crucial for the United States to challenge the enemy narrative. He noted that due to the use of the Web as a propaganda and recruiting tool by terrorist groups, the Internet had become a front in the war on terror, and should be given the same importance as the physical domain in which terrorists operate. Philip Seib, the director of the Center on Public Diplomacy at the University of Southern California, has also praised the program, noting that it represents an effective use of American “soft power.”

Even backers of the effort, however, acknowledge that ultimately, programs like the PDET operate on a small scale relative to the number of individuals, especially young men, who are vulnerable to extremist propaganda. The counterargument to this is that these young men represent a small but crucial component within the larger target population, a claim that can only be tested over time. The veracity of either perspective will be difficult to prove empirically since it will manifest in things that did not happen (that is, conversion to a more radical political stance or actual acts of ideologically motivated violence), as opposed to those that did occur and could, consequently, be observed and recorded.

Personal Democracy Media

Personal Democracy Media is an independent media organization that focuses on providing a global forum for discussing issues surrounding technology, the Internet, politics, and society. The term *personal democracy* is based on the idea that advancements in Internet technology increasingly allow citizens to participate more fully in government processes. Cofounded in 2004 by Andrew Rasiej and Micah Sifry, Personal Democracy Media organizes the annual Personal Democracy Forum conference, and publishes the award-winning online news site TechPresident.

Personal Democracy Media’s organizational manifesto is motivated by the notion that democracy is changing as a result of new technology, which provides citizens with novel tools for enhancing their participation in politics. In contrast to an older political system that limited media participation to those who could afford the costly expense and labor associated with broadcast media, the Internet enables citizens to be active reporters, community organizers, publishers, and political leaders for virtually no monetary cost. Personal Democracy Media is founded on the belief that the Internet has promoted a revival of civic conversation because it allows like-minded individuals to connect and expand their social networks. They maintain

that citizens want a voice in their government, as well as increased openness and transparency from government and corporations. According to its organizational manifesto, Personal Democracy Media strives to provide a place for people who are challenging the status quo to meet and collaborate to “discover the tools powering the new civic conversation, spot the early trends, and to share in understanding and embracing this dynamic new force.”

Prior to initiating Personal Democracy Media, Andrew Rasiej counseled national and international politicians, offering new media advice to congressional representatives and political leaders such as Hillary and Bill Clinton. In 2003, he was named chairman of the Technology Advisory Committee for presidential candidate Howard Dean’s revolutionary digital media campaign. Since founding Personal Democracy Media, Rasiej has continued his involvement in other nonprofit organizations and leadership positions dedicated to promoting the use of the Internet for enhancing citizen involvement in politics and increasing government transparency and accountability. Cofounder Micah Sifry’s experience prior to Personal Democracy Media included working with the nonprofit organization Public Campaign, which was focused on issues of campaign finance reform. He also served as editor and writer of the magazine *The Nation* for 13 years, and authored several books on politics. While serving as the editorial director of Personal Democracy Media since 2004, Sifry has also worked as an Internet consultant for various political organizations, campaigns, nonprofits, and media entities.

In an effort to achieve its organizational objectives, Personal Democracy Media produces physical and virtual forums throughout the year. One of its largest events is the Personal Democracy Forum, which is an international cross-partisan conference that allows political professionals, activists, academics, and technologists to come together to explore and analyze technology and its impact on politics and government. The first Personal Democracy Forum was held in New York City following the 2004 presidential campaign, and focused on discussing the ways that the Internet was used by electoral candidates to fundraise, generate votes, and organize communities of supporters. Additionally, conference

sessions explored the dynamic and convergent roles of bloggers, journalists, and politicians during the 2004 election.

Since this initial meeting, Personal Democracy Forums have been organized in New York City each summer. The theme of its ninth annual conference following the 2012 election was “The Internet’s New Political Power.” Among the topics discussed by speakers and attendees included Internet privacy policy, global Internet issues, hacking and activism (hacktivism), and dynamic power shifts that have stimulated social and cultural change. Panels and discussions also explored new strategies for effective online organizing and campaigning, and examined how technology affected and reshaped politics during the 2012 election.

Beginning in 2009, Personal Democracy Media began organizing a series of European conferences that have occurred in various cities throughout Europe (Barcelona in 2009 and 2010; Brussels in 2012; Warsaw in 2013; and Paris in 2011 and 2013). Additionally, a Personal Democracy Forum was held in Santiago, Chile, in 2010. Past sponsors of Personal Democracy Forums include Microsoft, Google, Facebook, AT&T, and the Harvard Institute of Politics. Notable speakers have included Arianna Huffington, Lawrence Lessig, Eliot Spitzer, and Joe Trippi.

Personal Democracy Media also publishes TechPresident, which is an online news outlet dedicated to covering news about how technology is changing politics, government, and civic life. TechPresident journalists report on organizations’ and political campaigns’ uses of the Internet and social media, as well as activists and citizens who are using new technologies to change political processes. In 2007, TechPresident received the Knight-Batten Award for Innovations in Journalism for its coverage of the 2007 to 2008 presidential campaigns. This distinction rewards news and novel approaches to information exchange that enhance opportunities for digital engagement.

Social Media

In an effort to further communicate with citizens, Personal Democracy Media has adopted multiple social media platforms. It also maintains a Web site that features information about its organization and opportunities for citizens to become

involved in its initiatives. Its Web site hosts a digital library that holds an array of multimedia content, such as recordings of past Personal Democracy Forums and other relevant special events. A subscription-based area of its Web site, Personal Democracy Plus, offers further opportunities for citizens to stay informed of the latest news, tools, and resources for understanding how technology is utilized in government, politics, and advocacy.

Through producing conferences and events, as well as tracking and analyzing news, Personal Democracy Media attempts to provide resources for citizens, politicians, and advocates to understand democracy as it evolves with new advancements in technology. The global reach of its organization and communication outreach enables individuals to engage in international collaboration and discussion concerning the ways that digital media are used to facilitate a more participatory, connective, and transparent world.

narrow sense, it means the drive of firms to market products, cultural goods, and information differentiated according to individuals' preferences. Personalization impacts the production, circulation, and consumption of goods, media, and services. Firms evaluate the personal qualities, tastes, and experiences of citizens and consumers. To do so, they take advantage of digital developments in new media such as the Internet, mobile phones, and social media sites, which enable users to communicate through networks of personal contacts, and thus provide fundamental platforms for the personalization of products. In less familiar parlance, personalization refers to the intensification of media politics. Politicians persuade citizens by communicating to them their "authentic" personalities, tastes, and experiences, rather than by articulating policy platforms in more formal political settings. In both meanings, personalization is connected to major social transformations.

Background

The principal force behind the personalization of goods, services, and information flows is the need of the capitalist economy to boost consumption after the mid-1970s recession that halted economic growth in advanced capitalist countries. Since the 1940s, this growth had been based on the standardized mass production and consumption of commodities. In response to the 1970s crisis, and with the goal of increasing consumption, companies customized their production of commodities, targeting them toward niche markets. This shift toward flexible production transformed products in every sector, from automobiles to media commodities. This produced changes impacting all citizens and consumers, but they are especially relevant for the lifestyle of a new petite bourgeoisie: a middle-class segment characterized by an ethos of personal pleasure.

Digital technology accelerated this trend to customize products according to individual preferences. More sophisticated computers, new software—such as customer relationship management, a system of management applications to contact and communicate with consumers—algorithmic methods, Web 2.0, and social media facilitated the reprocessing of individual data. These innovations were so impactful that marketers

Personalization

Personalization is a key term in understanding contemporary transformations in the economy, technology, media, politics, and culture. In its

apply the term *personalization* to that set of personalization technology and means of communication such as e-mails, text messages, and applications connecting smartphones, social media, and Web sites. Online and social media corporations are central agents in personalizing products. Two of the most successful of these companies are the online bookseller Amazon, which instantly reprocesses feedback from all customers and recommends books to each customer in real time, and the social network site Facebook, with a news feed that is personalized according to individual preferences indicated by users' online behavior.

Cultural Controversies

Companies contend that personalization is an efficient tool to satisfy the genuine needs of consumers, customers, and users. They claim that personalization increases opportunities for citizens to participate in cultural life, increasing their knowledge while satisfying their desires.

On the other side of the debate, scholars and media activists are concerned that personalization allows companies to commodify data; companies convert individuals' personal information into items to be exchanged for financial gain. Scholars point to the cases of online search engines like Google and social network sites like Facebook that actively encourage the self-disclosure of personal information. They argue that Internet corporations sell this information to advertisers, which then target customers by personalizing the marketing of products online.

Tradable user-generated content includes demographic data, online activities (e.g., searches, e-mail communications, Internet links clicked, type of smartphone used), interpersonal communication and personal profiles—but not individuals' identities—in social media. Scholars' concern is that online users—termed “prosumers” or “produsers” because they consume, use, and produce economic value—are not paid for those activities of production. Further, they contend personalization entails the surveillance of citizens, and could be detrimental to civic life because companies personalize information flow—for example, in online newspapers linked to social network sites—thus hindering the development of civiness on common ground in daily interaction.

Politics

Interacting with those marketing developments, there has been a shift toward the personalization of politics in contemporary democracies. Political parties often experience difficulties in communicating their messages to stable electorates. This is related to the fact that the neoliberal and global restructuring of the economy has increased temporary contracts, part-time labor, and unemployment. This process fragments the working class and the middle classes, while eroding the link between group identities and political ideologies. Under these conditions, citizens receive political information from the media, turning the media into the principal space for political discourse.

Further, in a media-saturated environment, politicians must simplify their messages. Politicians thus focus on constructing the credibility of their personal images while deconstructing the personal images of their rivals—the politics of scandal becomes a form of political competition. As result, media politics employs the dramatic tools of television to produce celebrities and villains, while the personalization of communication, such as targeted advertising and social media, facilitates interaction with citizens. Finally, and related to the crisis in political ideologies, scholars observe that citizens tend to set political demands according to lifestyle expectations, shaped by cultural images both represented in and targeted via the media.
